PREFACE.

It is hardly so true in our day as when the maxim was first uttered, that laws are silent amid the clash of arms. But it is still true, and perhaps always will be, that the movements of armies and navies surpass all else in immediate popular interest, and the thunder of the guns appears to render the sounds of peaceful industry tame if not silent. In this volume we record the close of one war and a large part of the causes that are likely to produce another, in which Americans have the highest interest. The article on "Greece" narrates the closing operations of the war between that country and Turkey, and gives the terms of peace. The articles on "Cuba," "Spain," and the "United States" will enable the reader to inform himself as to the condition of things that led to the complication which will probably involve our own country in war by the time this volume is ready for delivery. Many questions that will naturally follow can be answered by turning to the enumeration of the land and naval forces of the two countries. A full account of the "National Guard of the United States" was given in the "Annual Cyclopædia" for 1895, and later statistics (where they exist) may be found in the articles on the several States in this volume. In pursuing the subject further, the reader will be interested in the articles on the United States Naval and Military Academies, the article on "Signals," which is accompanied by a colored chart, and that on the "Revenue-Cutter Service." If he is still further interested in the struggles for possession of territory that seem never to cease, he may turn to the articles on "India" and "West Africa," where he can read of the frontier wars carried on by European powers against uncivilized but not easily conquered tribes. And if he is inclined to consider the subject imaginatively—to follow the poet where he "saw the heavens fill with commerce," and heard "the nations' airy navies grappling in the central blue"—he may read the illustrated article on "Aërial Navigation."

In studying the progress of the arts of peace, the reader will find interesting the article on the Tennessee Centennial Exposition, and those on "Associations for the Advancement of Science," "Chemistry," "Uses of Compressed Air," the "Fine Arts," "Geographical Progress," "Metallurgy," "Railroad Service," "Street Railways," "Tin Manufacture," and "Wire Glass."

The summaries of American, British, and Continental literature will be found full as usual; and for those who take an interest in the trimmings and incidents of literature there is an interesting illustrated article on "Book Plates" prepared by an expert; while the illustrated description of the new Congressional Library is a subject for honest national pride.

To the articles on the larger religious bodies we add this year "Christian Scientists," the "Federation of Free Churches," the "German Evangelical Synod," "Oriental Churches in the United States," and "Volunteers of America."

A survey of the mercantile and monetary movements of the year may be had by

consulting the articles "Financial Review" and "United States Finances," together with the trade summaries in the articles on our own and other countries. Pursuing this subject into the speculative and adventurous region, the reader will be interested in our article on "The Klondike" with its accompanying colored maps.

A new and interesting feature will be found in the State articles this year, where we give the portraits of the Governors, with the exception of a few who failed to respond to our request for a photograph.

In the realm of science, the "Astronomical Progress" of the year is recorded by Prof. Swift, that in "Physiology" by Dr. Youmans, "Physics" by Dr. Bostwick, and the "National Academy" by Dr. Benjamin.

The yearly list of "Gifts and Bequests" will be found unusually interesting by reason of its extent. This feature was introduced in the volume for 1893, and the five lists thus far published make a remarkable showing. The aggregate in 1893 was \$29,000,000; in 1894, \$32,000,000; in 1895, nearly \$33,000,000; in 1896, \$27,000,000; and in 1897, \$45,000,000; making a grand total of nearly \$166,000,000.

Among the eminent dead of the year Charles A. Dana—who had a double career, as Assistant Secretary of War during the great civil contest and for nearly thirty years as the foremost journalist in the United States—comes first. We present not only a sketch of his life, but a fine portrait, which forms the frontispiece of this volume. The other men and women of letters who passed away in 1897 include: Alphonse Daudet, the French novelist; Jean Ingelow, the English poet; Margaret Oliphant, the story-writer and critic; William J. Linton, the artist and author; William T. Adams, known to the boys as Oliver Optic; Joel T. Headley, popular a generation ago; Margaret J. Preston, Alice Wellington Rollins, Margaret Hosmer, Justin Winsor, and Daniel G. Thompson in our country; and in Europe Isabella Banks; Cavalcaselle, the Italian art historian; Richard Holt Hutton; Meilhac, the French dramatist; Francis Turner Palgrave; Riehl, the German historian; Sir John Skelton; and Vacherot, the French philosopher. The necrology of the artists includes the names of Homer Martin, Johnson M. Mundy, John Sartain, Eliza Greatorex, Max Maretzek, George P. Boyce, Sir John Gilbert, Charles P. Knight, and John L. Pearson. Among the scholars we lost were Henry Drisler, Solomon Deutsch, James Hammond Trumbull, Francis A. Walker, E. Cobham Brewer, Sir Augustus Franks, James Legge, Francis W. Newman, and Charles J. Vaughan; while the scientists and inventors included Edward D. Cope, Alfred M. Mayer, Theodore Lyman, Campbell Morfit, Alvan G. Clark, George M. Pullman, Carl R. Fresenius, Sir Isaac Holden, Sebastian Kneipp, and Alexander M. Ross. The clergymen whose earthly career was closed included Father Hewit, Joshua H. McIlvaine, George H. Houghton, Bishop Rulison, Henry Drummond, Edward M. Goulbourn, William W. How (the hymn-writer), and Baron Plunket. Of statesmen the world lost Canovas del Castillo, the Spanish Premier, assassinated by an anarchist, Lord Rosmead (Sir Hercules Robinson), Sir Rutherford Alcock, John Anthony Mundella, James R. Doolittle, Daniel W. Voorhees, and Isham G. Harris. Of reformers Neal Dow completed a long life and Henry George was called away in mid career. Of those who played noticeable parts in our great civil war were Couch, De Trobriand, McLaws, Pleasanton, R. W. Meade, Samuel P. Lee, A. C. Rhind, and John L. Worden; while the eminent European soldiers who passed away included Sir Henry Havelock-Allan, Sir William Jervois, Sir George Malcolm, and Baron Sterneck. Of all these, and many more, brief but comprehensive sketches will be found here.

The book closes with an index covering the two volumes of the new series.

CONTRIBUTORS.

Among the Contributors to this Volume of the "Annual Cyclopædia" are the following:

Oscar Fay Adams,

Author of "A Dictionary of American Authors."

CORSON, JULIET,
GOULBOURN, EDWARD MEYRICK,
NEWMAN, FRANCIS WILLIAM,
OLIPHANT, MARGARET,
PEARSON, JOHN LOUGHBOROUGH,
THAYER, ALEXANDER WHEELOCK,
and other articles.

Marcus Benjamin, Ph. D.,

Editor of department of chemistry in the "Standard Dictionary."

ASSOCIATIONS FOR THE ADVANCEMENT OF SCIENCE,
COPE, EDWARD DRINKER,
MAYER, ALFRED MARSHALL,
NATIONAL ACADEMY OF SCIENCES,
NEW YORK CITY,
and other articles.

J. H. A. Bone,

Of the "Cleveland Plain-Dealer."
OHIO.

John Henry Boner,

Of the "Standard Dictionary" staff.

ALABAMA,
CONNECTICUT,
MAINE,
MARYLAND,
NEW JERSEY,
VIRGINIA,
VOLUNTEERS OF AMERICA,
and other articles.

Arthur E. Bostwick, Ph. D.,

Superintendent of New York Free Libraries.
PHYSICS.

William G. Bowdoin.

BOOK-PLATES.

Thomas Campbell-Copeland,

Formerly of United States Census Bureau.

MECHANICS, JUNIOR ORDER OF,
STREET RAILWAYS,
UNITED STATES MILITARY ACADEMY,
UNITED STATES NAVAL ACADEMY.

Mrs. Helen C. Candee.

ILLINOIS,
MUNDY, JOHNSON MARCHANT,
and other articles.

James P. Carey,

Formerly Financial Editor of the "Journal of Commerce."

FINANCIAL REVIEW OF 1897.

John Denison Champlin,

Editor of "Cyclopedia of Painters and Paintings."
FINE ARTS IN 1897.

Hon. Benjamin F. Clayton,

President of the Farmers' Congress.

FARMERS' CONGRESS.

Charles Henry Cochrane,

Author of "The Wonders of Modern Mechanism."

AERIAL NAVIGATION,
CALCULATING MACHINES,
KINETOSCOPIC PICTURES,
KITE-FLYING,
TIN-PLATE MANUFACTURE,
WIRE GLASS,
and other articles.

William F. Coston,

Joint Inventor of the Coston signals.

SIGNALS, NIGHT.

Mrs. Bessie Nicholls Croffut.

LITERATURE, AMERICAN, IN 1897,
LITERATURE, BRITISH, IN 1897.
SURETY COMPANIES.

Thomas R. Dawley, Jr.

CUBA.

Charles Fitzgerald,

Art critic of the "Evening Sun."

LINTON, WILLIAM JAMES,
MARTIN, HOMER DODGE.

Mrs. Fredericka B. Gilchrist.

PROTESTANT EPISCOPAL CHURCH.

Rev. William Elliot Griffis, D. D.,

Formerly Professor of Physics in the University of Tokio.

JAPAN,

KOREA.

George J. Hagar,

Associate Editor of the "Columbian Cyclopædia."

GIFTS AND BEQUESTS,
ORBITUARIES, AMERICAN.

Rev. Moses Harvey,

Author of "Text-book of Newfoundland History."

NEWFOUNDLAND.

J. Castell Hopkins,

Editor of "Golden Canada."

CANADA, DOMINION OF,
MANITOBA,
NEW BRUNSWICK,

THE ANNUAL CYCLOPÆDIA.

A

ABYSSINIA, an empire in eastern Africa. The ruler, styled *Negus Negusti*, or King of Kings, is Menelek II, who after the death of Johannes II in battle with the dervishes overcame his rivals and established himself on the throne in 1889 by the aid of arms furnished by the Italians. He had entered into a treaty with Italy, signed at Ucciali on May 2, 1889, at the beginning of the struggle, while he was still only King of Shoa, and this treaty was confirmed in October of that year. The Italian version gave to Italy a protectorate over the Empire of Abyssinia, otherwise called Ethiopia. Menelek denied that the treaty conferred such right. The relations between him and the Italians became strained on account of his refusal to recognize the protectorate, and his denouncement of the treaty in 1893 led to a rupture. In 1895 the Italians occupied Tigre, the northern kingdom, and advanced into Amhara; but after the forces of Ras Mangascia, King of Tigre, had been driven out by the Italians, Menelek marched into the north with a large army from Shoa, surprised the Italian garrisons, surrounded the main body of Gen. Baratieri's army near Adowa, and well-nigh destroyed it in a general engagement fought on March 1, 1896. Through the friendly intervention of Russia a treaty of peace was concluded on Oct. 26, 1896, at Adis Abeba. By this treaty Menelek recognized as Italian possessions all territories lying north of the Mareb, Balesa, and Muni rivers, and Italy recognized the absolute independence of Abyssinia and the dominion of Menelek over all territories south of that line. The government of Abyssinia, or Ethiopia, is of a feudal character. The kingdom of Tigre in the northeast, the adjoining province of Lasta, the central kingdom of Amhara, Gojam next to it, and the powerful kingdom of Shoa in the south make up Abyssinia proper, the dependencies of which extend into Somaliland as far as Harrar and embrace a large part of the country of the Gallas. The port of Massowah, formerly disputed between Abyssinia and Egypt, has been annexed by Italy with the other dependencies to the north of the Abyssinian plateau and a part of the highland district in the northeastern part of Tigre. The area of the empire is estimated at 150,000 square miles, and the population at 3,500,000. The Abyssinians once followed Jewish rites, and still practice some of them, but since the fourth century they have been Christians of the Alexandrian rite. The head of their Church, called the *abuna*, is a Copt selected and consecrated by the Patriarch of Alexandria. There are about 12,000 monks, presided over by a native ecclesiastic, called the *echeged*, and these and the priests instruct a select portion of the

youth in grammar, poetry, religious ceremonial, and song. The judicial magistrates are the governors, chiefs, and landed aristocracy. The people raise cattle, sheep, and goats, and cultivate the land to a limited extent. Cotton, coffee, the indigo plant, the sugar cane, the date palm, and the vine grow wild. There are extensive forests abounding in valuable woods. The principal exports, sent mostly through Massowah, are skins, ivory, butter, gums, and mules. Besides the forces of the feudal chiefs, the Negus has a trained army of enlisted men armed with modern rifles.

The climate is varied, producing the fruits of all zones, for Abyssinia is composed of a succession of table-lands rising from 4,000 to 8,000 feet in height, intersected with deep valleys and ravines. In the lower plateaus rice, sugar cane, indigo, and other tropical products grow wild; in the more temperate regions vines and nearly every species of European fruits and vegetables are found in great luxuriance; while the loftiest plains are suited to the cultivation of barley and some native species of grain. The southern districts are the natural home of the coffee tree. The principal crop is doura, from which the Abyssinians make a great part of their food. The banana is the principal fruit eaten by the natives. There are excellent breeds of horses and mules in the country. The mineral wealth of Abyssinia is unquestionable, and the lack of expert labor has been the obstacle to the production and manufacture of the useful metals. The sale of gold is forbidden by law. It is forbidden also to traffic in ivory, though elephants are numerous.

The ruling caste is of the Hebrew race, formed of successive immigrations from Palestine. The Jewish religion was established in Ethiopia by Menelek, son of Solomon and Makeda, or Namula, the Queen of Sheba. King Solomon provided his favorite son, when he went to join his mother, with a guard of 12,000 Israelitish soldiers, with whose aid, after Makeda's death, he founded the Solomonian dynasty of Ethiopian emperors. Jerusalem became from that time the center of pious pilgrimages of the Abyssinian people. An important Jewish immigration took place during the first captivity, and another during the reign of Salmanasar. These exiles became rapidly assimilated and absorbed in the bulk of the Ethiopian nation. A last exodus followed after the destruction of the Temple, but these later comers have remained to the present day outside the pale of Abyssinian society, maintaining their *ghettos* in the province of Samen, where they follow metal working and remain faithful to their ancient creed. The Ethiopians, on the other hand, embraced Christianity at

a very early period, retaining, however, all the rites, the spirit, and the doctrines of their old religion that were not abrogated by the Gospel. These Ethiopians, who are genuine Hebrews in race, form the aristocracy of the country, furnishing the dignitaries of church and state and the feudal chiefs of society. There are about 400,000 of these descendants of Hebrew settlers, ruling over 14,000,000. The Negus can raise an army of 200,000 men, of whom more than half are equipped with modern rifles.

Diplomatic Missions.—The loss of the battle of Adowa on March 1, 1896, when the Italian army was beaten in pitched battle by the Abyssinians and 12,000 Italians were left dead on the field, led to the renunciation of the protectorate over Abyssinia claimed by the Italians in accordance with their version of the treaty of Ucciali, though the original Amharic text, as interpreted by the Abyssinians, contained no such meaning. The final agreement was facilitated by the intervention of the Pope, who sent Monsignor Macarius to the Emperor Menelek to intercede for the release of the Italian prisoners, and who also bespoke the good offices of France and Russia to bring the treaty negotiations to a satisfactory conclusion. The treaty of peace was finally concluded between Major Nerazzini, the Italian plenipotentiary, and the Negus Menelek at Adis Abeba on Oct. 26, 1896. As in regard to the former treaty, a difference of interpretation arose between the Italian and Abyssinian governments in regard to one of the clauses of the new one. According to the official Italian text, Italy undertook not to cede any portion of her Abyssinian territory to any power except Abyssinia until the frontier between Menelek's dominions and the Italian colony is definitely fixed. According to the Abyssinian version, Italy engaged herself never to cede any part of her Abyssinian territory to any power save Abyssinia.

Since the withdrawal of Italy's claim to conduct the foreign affairs of Abyssinia, a right that was not denied by any of the European powers except France and Russia before the new treaty supplanted the treaty of Ucciali, the Negus Menelek has obtained the unquestioned right to treat directly with foreign powers. The European governments were not slow in seeking to establish diplomatic relations and establish their influence at King Menelek's court. The French, whose colony of Obok adjoins Abyssinia, concluded a commercial treaty with the Negus in January, 1897, and four or five French expeditions were planned for the purpose of opening Abyssinia and the eastern Soudan to French influence and commerce. M. Bonvalot was officially commissioned to investigate the problem of entering the Soudan. Prince Henri d'Orleans undertook a similar mission without official credentials. Max Baveler was sent out by the French Chamber of Commerce to prepare the way for another party under the Vicomte de Constantin. One of the objects sought by the French is a mission to construct a railroad from Djibouti to Harrar. The line is expected to be completed to the Abyssinian town of Antotto before the end of 1899. M. Lagarde, the Governor of Obok, was intrusted with a new diplomatic mission to the Negus. An imposing diplomatic mission was conducted by Rennell Rodd, secretary to the British legation in Egypt, who was dispatched as special envoy, with a numerous staff, to reopen diplomatic relations with the Ethiopian monarch and to acquaint him with the nature and extent of the British claims in Egypt and the regions of the upper Nile, and secure his recognition of British and Egyptian rights over Kordofan and Sennaar and throughout the regions of the White Nile. One of the objects of

the mission was to induce King Menelek to retire from territories that he had conquered which formerly belonged to Egypt. A commercial convention formed part of the negotiations, also a proposal for co-operation against the dervishes of the Soudan. Russian expeditions of a semiofficial or patriotic character, though ostensibly religious or scientific, had been numerous in Abyssinia during the nominal Italian protectorate from the time when the Cossack Ashinoff led the way in 1889. The Russian Church has sent missionaries to the country at various times. Lieut. Mashkoff went on a political errand in 1891. In 1895 a party of Abyssinian prelates and princes visited St. Petersburg under the personal conduct of M. Leontieff. Col. Maxinoff visited Menelek at Adis Abeba in the early part of 1897. A new Russian expedition under M. Poliakov set out from Europe in the beginning of April, 1897.

The English expedition, setting out from Zeila, reached Adis Abeba on April 28. An agreement between Great Britain and Abyssinia was signed on May 14, and on the following day the envoy and his suite took their departure.

The Emperor Menelek in treating with the English envoy was even less inclined to acknowledge as lying within the British sphere territories formerly conceded to Ethiopia by British diplomacy and others actually occupied by Abyssinian forces than he was to sanction the retention by Italy of the boundaries within the Abyssinian high plateau to which he had provisionally consented in the treaty of Adis Abeba. Kassala itself was formally restored to Ethiopia by the treaty of June 3, 1884, concluded between the Negus Johannes and the Egyptian Government under the auspices of Great Britain. Afterward Great Britain, on March 24, 1891, recognized as Italian the whole Ethiopian Empire, from the river Juba to the Blue Nile, and by a second treaty of April 15, 1891, completed this gift of Abyssinia to Italy, including in the gift the town of Kassala, with the stipulation that it should be retroceded to Egypt. In like manner England, after agreeing with France by the convention of Feb. 8, 1888, to neutralize Harrar, which at that moment was in the actual possession of Abyssinian troops, by a new treaty on May 5, 1894, expressly abandoned Harrar to Italy. Germany also, in the Anglo-German agreement of July 1, 1890, sanctioned the abandonment of Ethiopia and the Galla countries to Italy. Believing that the treaty of Adis Abeba canceled all these former treaties by which European powers disposed of his territory without his knowledge or consent, Menelek was anxious that in coming to a definite boundary agreement with Italy, and in fixing the boundaries between Abyssinia and the Egyptian Soudan, the great powers should ratify the arrangement. While the Negus was willing to concede the provisional boundary formed by the rivers Mareb, Belesa, and Muna as the permanent frontier, the various Ras wanted him to insist on a frontier considerably to the north.

Italian Policy.—Major Nerazzini was commissioned to delimit the frontier of the Italian possessions on the line laid down in the treaty of peace. King Menelek endeavored to persuade the Italians to abandon the Mareb boundary and accept a new frontier at the foot of the high plateau. The Government of the Marquis of Rudini decided to retain the positions on the plateau, which, according to expert opinion, could be defended by 5,000 men against an army. After a week's discussion, on May 22 the Italian Chamber passed a vote of confidence in the undefined plans of the Government, rejecting by a majority of 89 a radical proposal in favor of entire abandonment, and by a much larger

majority the motion of the Opposition to suspend action until the new limits were fixed at the widest extent allowed by treaty through the delimitation survey. Later in the year the Government decided to appoint a civil governor in the place of Gen. Vigano. Ras Alula before his death, in February, 1897, gave the Italians trouble by his raids upon their territory. On the opposite frontier the dervishes taxed their resources. Their horsemen attacked the Beni Amer tribesmen in Italian territory and drove away their cattle, killing 30 of the Askaris who were sent to repel the raid. A large dervish force left Ghedaref at the beginning of January, and, plundering the Bazas tribe, entered the country of Barias, who fled with their cattle to the hills. The Italians, anticipating an attack on Agordat, concentrated troops on the plain with such rapidity that the dervishes withdrew and intrenched themselves at Amideb. The Italian prisoners released by the Negus began to arrive home in the beginning of January. Toward the end of that month Menelek directed that no more prisoners should be set free until the Italians evacuated the part of Erythrea restored by treaty to Abyssinia. Further convoys of prisoners were sent to Zeila later. The last prisoner to leave Adis Abeba was Gen. Albertone. In the provinces a few Italians still remained in May. Major Nerazzini continued his negotiations with Menelek for a definitive treaty until early autumn, when he returned to Italy for fresh instructions. King Menelek would agree to none of the proposals of the Italian envoy, and promised only that he would grant to Italy a better frontier than that accepted by Count Antonelli but rejected by his Government in 1891. By this Italy would lose the two fertile provinces of Serach and Oguleh-Cusai, as well as the strong Mareb boundary. The boundary that he proposed starts from Tomat, on the Atbara, joins the Mareb at Todluk, follows that river to its confluence with the Mai Ambessa, which it mounts to its source, follows the Mai Feecia down to the upper Mareb, ascends the Mai Raetta, passes south of Gura, Digsa, and Mahio, descends to the plain of Galline Faraone, and runs parallel to the Red Sea at a distance of 60 kilometres from the coast. On the southeastern border it continues at 180 miles from the shore of the Indian Ocean, joining the Juba to the north of Bardera and leaving Luk under the suzerainty of Abyssinia, though it remains an Italian trading center. This frontier was accepted by the Italian Government, with a reserve as to Adi Caje, a post that had been fortified by the Italians at an expense of 3,000,000 francs. The chief points of the negotiations, which were to be brought to a conclusion within a year of the signature of the treaty of Adis Abeba, on Oct. 26, 1896, were the amount of the ransom for the Italian prisoners and the delimitation of the frontier. Menelek abated his claim for ransom from 20,000,000 to 10,000,000 lire, but grew more exacting in regard to boundaries. The Italian Government was not ready to evacuate at once the high plateau, on account of political considerations at home and international complications, and for fear of intertribal conflicts resulting upon the withdrawal of Italian forces. The prospective restoration of Kassala to Egypt, which could be accomplished as soon as the Anglo-Egyptian forces gained possession of Khartoum and Berber, would hasten the development of the ultimate Italian policy in Africa. If the colony could not be made self-supporting and defensible without any further sacrifice of Italian blood or treasure, the Rudini Government would prefer withdrawal from the Abyssinian plateau, from Asmara and Keren, and even from Massowah. The Erythrean budget as prepared and presented to the Chamber

on May 18, provided for an expenditure of 19,800,000 lire for 1897. Some thirty the estimate was cut down by the ministry to 8,500,000 lire. In May Signor Rudini induced the Chamber to endorse the possible limitation of the military occupation to Massowah alone and the organization of the rest of the colony, including the high plateau, under tributary native chiefs. Hence Menelek increased his demands and refused the Mareb frontier, which he was willing to concede after the battle of Adowa. Major Nerazzini concluded with Menelek a commercial treaty assuring for Italian citizens full freedom of movement and of trade, with protection for merchants and merchandise and most-favored-nation treatment in respect to customs and octroi duties. Both contracting parties bind themselves to promote the opening of routes for the better development of commercial relations between the Italian territories on the Indian Ocean and the south of Abyssinia. The treaty gave to Italy the right to have a permanent representative at the Abyssinian court. Capt. Cissodocola was appointed to this post, while Senator Bonfadini was made Civil Governor of Erythrea. In August the Italian Government informed the British Government that it was desirous of transferring Kassala to the Anglo-Egyptian authorities as soon as possible.

Operations in Somaliland.—After the defeat of the Italians in 1896, Ras Makonen, a cousin of King Menelek, and the most powerful of the feudal princes of Abyssinia, established himself in Harrar, of which he was appointed governor, and with his army of 40,000 men extended his conquests over the Somalis, occupying Ogaden, a district lying within the sphere assigned in conventions to Great Britain.

The Equatorial Provinces.—Rennell Rodd's mission, so far from obtaining from Menelek an admission that the region of the White Nile was within the Anglo-Egyptian sphere, took back to England the reply that he considered the whole *Hunterland* as Abyssinian, including the banks of the Nile down to Khartoum and up to the Lake Nyanza, with all the country of the Gallas. He declared, however, that he would not assist the dervishes against the English, and when the Khalifa sent an ambassador later, seeking an alliance, he declined to enter into a league with his hereditary enemies. In Gallaland and Somaliland the English envoy conceded to Abyssinia some of the places reserved to British influence in the Anglo-French agreement of 1891. The Russian Major Leontieff, who obtained from King Menelek the appointment of Governor-General of the Equatorial Provinces of Ethiopia, made arrangements with Prince Henri of Orleans to organize an expedition to take possession of both banks of the Nile up to the borders of the Congo State, in the name of the Emperor of Ethiopia, and thus frustrate the British plan of connecting the East African protectorate with Egypt, and at the same time establish communications through Bahr el Ghazal with the French outposts on the upper Ubangi. French engineers had obtained the right to build a railroad from Jibouti to Harrar and Adis Abeba. A concession for railroads in Abyssinia was granted to a company formed by Alfred Ilg, a Swiss engineer, and Alfred Cheneux, a French explorer. The French were already erecting for King Menelek a telegraph line over this route. The rival French expedition that went out under M. Bernalot, with whom Prince Henri of Orleans quarreled at the time he reached the White Nile first, passing through the Gall country, where the intercession of Menelek secured a good reception for the Frenchmen, who were now led by the Marquise de Bonchamps. The object of this expedition was to establish France solidly on the left

bank of the White Nile with the help of an Abyssinian Ras, and afterward support the French on the Nile.

The sphere of influence claimed by the Emperor Menelik extends from 14° to 2° of north latitude. Starting from the boundary line of Italian Erythraea, the frontier follows the fourteenth parallel to Tamat, on the Atbara, and thence goes straight to the White Nile, leaving to Abyssinia a good part of the island of Meroe, Sennar, and Abu Harraz, on the Blue Nile, and reaching the White Nile a little below Koweh, about 150 kilometres up the river from Khartoum. From this point it ascends the White Nile, leaving the left bank to Abyssinia as far as Lake Aïbert, whence the frontier follows the second parallel of north latitude eastward to the Juba river, and by this stream follows the Italian frontier of the Somali coast up to the English frontier above the Ogadain. This new frontier was provisionally accepted by England, which retains on the Gulf of Aden no more than a strip of about 75 kilometres behind Zofia and Berbera. Menelik submitted this series of delimitations to France, Russia, and Turkey for their approval, with the view of settling the definitive boundaries of his empire under the guarantee of Europe.

AERIAL NAVIGATION. The introduction of aeroplanes has caused marked advances in aeronautics during the past decade, largely through the experiments of Hiram S. Maxim, of England, Otto Lilienthal, of Prussia, and Samuel P. Langley, of the Smithsonian Institution, Washington, D. C. These three have made extensive and costly experiments, extending over a period of years, and Lilienthal gave his life to the advancement of the science, being killed by a fall from his soaring apparatus Aug. 11, 1896. Other investigators in this field, whose researches have added to our knowledge of the principles of mechanical flight, are Octave Chanute, of Chicago; Arthur Stentzel, of Altona, Prussia;

Montgolfiers. The experiments of all the investigators favor aeroplanes slightly concave on the lower side, and they have had to overcome immense difficulties in the way of securing material combining the requisite strength and lightness.

Maxim's aeroplanes were stretched on frameworks of steel tubing, stiffened with wire, the material being balloon cloth in two thicknesses. The reason for making the cloth double was that the planes, being large, developed a great tendency of the material to flap and bag, causing a deformation that interfered seriously with the lifting capacity. By using two thicknesses, set slightly apart, and making the lower thickness somewhat porous, while the upper was almost air-tight, it was possible to preserve a flat surface of the lower thickness of cloth, transferring all the flapping to the upper surface, where it causes no serious inconvenience. The propelling machinery was placed on a deck of trussed construction, suspended below a large aeroplane, set at an angle of about 1 to 10, and having other and smaller aeroplanes above and at the sides, set well apart, the object being to prevent their taking the wind from each other. The mechanism was quite large, constituting an air-ship, with 4,000 feet of lifting surface. A steam engine was used for motive power, and the apparatus was run along a light railway track until the speed gave the required lifting power to take it from the ground. Maxim took infinite pains in the construction of engines and boilers of sufficient lightness, and finally settled on a boiler having thin copper water tubes, curved among the flames. Through these he maintained a forced circulation and was able to obtain 800 feet of heating surface with only 34 feet of flame surface. The boiler weighed half a ton, carried 200 pounds of water, and by means of gasoline fuel, with flames 22 inches high, was made to furnish steam enough for the engines, whose efficiency was 364 horse power. The engines were

of marvelous construction, and would have served to make Maxim famous had he done nothing else in the line of invention. They weighed less than 2 pounds to the horse power, which is about one thirtieth of the weight of the latest and best marine or stationary steam engines. They were of the double-expansion type, used the steam at 300 to 350 pounds pressure, had a piston speed of 750 feet a minute, and were made throughout of high-grade steel, many of the parts being tempered to increase the tensile strength. These engines drove the screw propellers, which were 17½ feet in diameter, with 16 feet pitch. Each engine being separately connected with its propeller,

they could be used for steering, as well as driving the machine, by simply running one engine, and consequently its propeller, a little faster than the other. Unfortunately, this flying machine was badly wrecked on the first day of its trial; but as the wreck was caused by the unexpectedly great lifting power developed, causing a bending of the axes of the upper wheels that had been provided to confine the machine so that it could not take any extended flight, and as numerous data were obtained of the details of its operation, the experiment was universally regarded as a success. On the day of trial three runs were made over the track, which was about 1,800 feet long. The first two runs

MAXIM'S FLYING MACHINE.

MM. Tatin and Richey, of France; Carl E. Myers, of Mahawk, N. Y.; A. M. Herring, Horatio Phillips, and Lilienthal, of England; and George Wellner, of Bremen, Austria. All these, except Myers, have made use of some form of aeroplane, imitating the soaring of birds or the suspension of kites. Investigations in kiteflying have aided the aviators, and a description of recent progress in these will be found in the article KITEFLYING in this volume. Maxim was the first to build a machine that actually lifted itself off the ground without external aid or the pull of a bag of gas, and this feat, accomplished July 31, 1894, marked the greatest achievement in aeronautics since the time of the

were made at moderate speed, in the endeavor to familiarize the operators with the workings of the mechanism. The third run was made with the steam at 310 pounds. The whole mechanism weighed a little less than 3 tons, and the dynamograph showed that the following lifting powers were exerted: 100 feet, 700 pounds; 200 feet, 1,700 pounds; 300 feet, 3,000 pounds; 400 feet, 3,700 pounds; 500 feet, 3,950 pounds; 600 feet, 5,750 pounds; 700 feet, 6,000 pounds; 800 feet, 6,450 pounds; 900 feet, 6,500 pounds; 1,000 feet, 8,700 pounds. The machine was lifted from the ground after running about 600 feet, and continued to ride against the upper rails until the unexpected lift of 8,700 pounds caused the break-up.

Otto Lilienthal was a Prussian engineer, who began experimenting about 1890 with winglike planes,

LILIENTHAL'S LAST SOARING APPARATUS.

which he carried just below his armpits, and, by taking a swift run from a hilltop against the wind, was able to soar or slide down on the air to a considerable distance. He called his mechanism a soaring apparatus, and by patient trials and experiments developed and improved the structure until it assumed the form here shown. He built about a dozen different types in all, and patented them in many countries, selling some to other investigators and experimenters. Lilienthal constructed a hill on purpose to have one convenient for conducting his experiments. His first apparatus was about 16 yards in extent of surface. He practiced with this, and learned to balance and guide it to a certain extent by the swaying of his body. Later he added a tail or rudder, and in 1895 he built one with two superposed *aéroplanes*, between which in the rear was hung the rudder. This arrangement gave him a larger area of supporting surface, and he was able to soar higher, and at times to remain stationary in the air. His longest flight was somewhat over 900 feet. He exercised great care and seldom soared more than 25 feet above the ground. He was endeavoring to soar in curves, so as to circle in imitation of birds, shortly before he received his fatal fall. It was generally thought that his two-plane apparatus was not so safe as the single plane, with which there had been no serious accidents. Of the various sizes made, he preferred those having surfaces of about 100 feet and measuring about 18 feet from tip to tip. He built these of a weight of 50 to 60 pounds, and so constructed that they could be folded up for easy conveyance.

Pileher, of England, and Mouillard, of Cairo, Egypt, have also built soaring apparatus, on the principles developed by Lilienthal, with devices of their own invention. Both of them have used surfaces as great as 200 feet, but these can be used only in calm weather. A. M. Herring and several others in the United States have also built similar mechanisms or purchased them from Lilienthal for experiments. Octave Chanute, of Chicago, built them in a variety of forms, some having six or eight wings or planes.

Samuel P. Langley's experiments began about 1896, with a circular whirling apparatus having an arm swinging around a circle about 65 feet in diameter, from the end of which he suspended all sorts of weights and plates, and whirled them at different speeds, to study the laws that governed rapid motion through the air. A few years later Horatio Phillips conducted similar experiments in England on a somewhat larger whirling mechanism. He constructed a machine with a series of superposed *aéroplanes*, the whole weighing 250 pounds, and was able to whirl it around a circular track with very little power. Prof. Langley tried small weights, studying the principles involved, before he tried to build a machine that would fly. He found that a thin brass plate weighing a pound, when hung from a spring at the end of his whirling arm, could be made to reduce its pull or strain on the spring from 1 pound when stationary to an ounce or less when rapidly rotated, and that actually less power was required to rotate and sustain the weight than to sustain it when stationary. His experiments in this line continued until 1899, demonstrating that an engine of 1 horse power could support 200 pounds weight in horizontal flight, by taking advantage of the inertia of the air as a support. Having established the conditions to be met, Prof. Langley set about building a machine, which has been styled an *aërodrôme*. This was completed in November, 1893, but was not sailed with satisfactory success until May 6, 1896, when a successful trip was made over the waters of the Potomac, the place being selected in order that the *aërodrôme* might alight on the water and not damage itself by falling. Prof.

LANGLEY'S AËRODRÔME.

a, empty float; b, boiler; p, p, propellers; r, rudder; w, w, w, wings or *aéroplanes*.

Langley speaks of the machine as a great steel kite made to suspend itself in the air by the speed or thrust of its motor instead of a restraining kite string. The great difficulties that he encountered in its construction were sufficient reduction in weight and proper balancing. As originally designed, his *aërodrôme* was to be a mechanical bird

of about 25 pounds weight, including a 1-horse-power engine. When the first construction was completed it weighed about 40 pounds, and the motor developed but half a horse-power, and this slight machine of endeavor to secure a sufficiently strong construction with little weight. Subsequent machines were built with engines driven by compressed air and by carbonic acid gas, but these also had to be abandoned, because it was found impossible to bring the weights of the boilers within the limits. Steam boilers were made in many ways, in the endeavor to secure one light enough and yet large enough to make sufficient steam. At last one was designed which was very wasteful of steam, but which would deliver from 1 to 1½ horse-power, and with a 7-horse engine and boiler together, without fuel, 7 pounds. Gasoline vaporized was used for fuel, and about 2 quarts of water supplied the boilers. The main frame is of steel tubing, the entire length 10 feet, the wings measuring 12½ feet from tip to tip and being fixed—that is, not flapping. The total weight is slightly under 30 pounds. The two propellers are each about 4 feet long, and make 800 to 1,300 revolutions a minute. It had to be launched in the face of the wind, and when completed was designed to be shot off with a spring mechanism from the top of a house boat in a dead calm. It could not start itself, because of the initial velocity (about 25 miles an hour) required to sustain it in the air. Two years and a half were occupied from the time the aërodrome was completed until it was made to soar away as designed. First, days were spent waiting for dead calms that never came; then the spring motor proved unsatisfactory, and another launching device had to be contrived and constructed; then, when a launch was actually made, it was found that very nice balancing was necessary to preserve the position in the air. The aërodrome had a way of starting off on an up curve and tumbling over itself, as it were, or of shooting suddenly downward into the water, until it seemed as if it never could be made to sail properly. At last, in May, 1896, one day of trial, at which it was expected that the machine would develop the usual or new eccentricities, the operators were delighted to see it soar away as steadily as a great bird, describing large curves in the air, and after its water supply was exhausted sink gently down on the surface of the Potomac, without the slightest injury. The trial was immediately repeated, with equally satisfactory results. Several subsequent successful trips have been made, the most notable being on Nov. 28, 1896, when the aërodrome sailed three-fourths of a mile, at a speed of 30 miles an hour, rising, from a starting point perhaps 15 feet above the water, to an elevation of about 100 feet. The flight is limited by the small amount of water carried. Prof. Langley believes that if a sufficiently light condenser can be added to preserve the water for use over and over, a flight may be sustained for hours.

Two French investigators, M. Tatin and Richet, in 1896, made a test of an air-ship that seems, from the brief description sent out, to be somewhat like Prof. Langley's, but larger. Steam was used as a motive power, the engines being fixed on a car or body made of light pine, braced with steel wires, and sustained by two fixed wings or aëroplanes of 86 square feet surface. The total weight of the machine was 73 pounds. Two oppositely revolved propellers were used, one being placed forward and the other aft. A fixed tail or rudder was employed to steady the flight. The entire apparatus weighed 73 pounds, exclusive of fuel and water, and was propelled, entirely by its own motor, for a distance of 460 feet, measured in a straight line on the ground, the velocity attained being 59 feet a second. Guided

by their experience with this machine, they built another in 1897, in which the weak points were improved. This second mechanism soared or flew about 250 feet, when it met with an accident.

The majority of recent investigators in this field of research regard stationary or fixed aëroplanes as the best arrangement, rather than flapping or beating wings in imitation of birds. Rudolph Koseh, a follower of Lilienthal in experiments with soaring apparatus, dissents from this opinion, and has constructed an apparatus to demonstrate the truth of his assertion, and also that circular wings are the best form. His mechanism consists of four circular planes or wings, slightly concave beneath, and arranged in pairs, each having a rotary motion

RUDOLPH KOSEH'S MECHANISM FOR ILLUSTRATING THE POWER OF CIRCULAR WINGS.

about the upright member, and also an up-and-down motion, communicated by a man working cranks below. The pairs are rotated oppositely. With this apparatus a man of average strength exerted for a short time a lifting strain of 50 pounds, or, to express it technically, with an angle of incidence of 10 and aspect of 72 rotations a minute, the dynamograph recorded a lift of 50 pounds. The circles of these wings were made of steel tubing, with wire spokes, and the covering was of cambric. Mr. Koseh points out that the circular form, which he was the first to construct, gives more surface for the same weight of frame than is possible with any other construction. The machine illustrated weighed 56 pounds, the planes being 6 feet 4 inches in diameter. His experiments suggest that propellers are best placed side by side, as were Maxim's.

Arthur Stentzel, of Altona, Prussia, after some years of experimenting with soaring apparatus, evolved a flying machine in 1896 that bore some resemblance to a gigantic butterfly with an exaggerated tail. The spread of the wings was 21 feet, and the surface 8½ yards. Compressed carbonic acid was the motive fluid used in the engine, which gave 3 horse power at a pressure of 9 atmospheres, or 1 horse power with 5 atmospheres. The machine weighed 75 pounds, and in use was suspended from a safety cable, to guide it in its flight and prevent damage by falls. When the wings were flapped with 1 horse power, the machine advanced 10 feet along the cable at each stroke of the wings; with 1½ horse power the advance was 13 feet to each stroke, in 1.3 seconds, the machine being lifted clear of the cable. The machine showed good stability

in the air, the rudder serving efficiently as a guide. Steel tubes were used for the main parts of the framework, and ribs of bamboo, with rubber

STENTZEL'S FLYING MACHINE.

cloth for the covering. The performance of the machine was so satisfactory to Stentzel that he is now building a larger one, designed to carry a man. This will have about 23 yards of surface, employing a 44-horse-power motor, and is designed to weigh 200 pounds.

Carl E. Myers, of Mohawk, N. Y., patented, April 20, 1897, what he styles a sky cycle or gas kite, this being a balloon of peculiar form shaped so as to split the air in its advance, the motor power being a man centrally suspended, so that he may operate both foot and hand cranks for rotating a propeller placed forward. This propeller is of most ingenious construction, having an area of 15 feet, but weighing only 24 pounds. It is made of a light steel frame, on which a cloth covering is twisted heliacally, so that it not only serves as a surface, but keeps the parts of the frame in position. Myers began his experiments by firing projectiles of all sorts and shapes from a spring gun of known force, thus learning the form best adapted to travel against the wind. He claims to have arrived at a formula that enables him to produce the very best form for the purpose; and though he has constructed the gas bags of his sky cycles in different forms, yet by

MYERS'S SKY CYCLE.

following his formula he always secures a shape that makes good headway against the wind. He constructs his apparatus so that it is slightly heavier

than the air, depending on the propeller to draw it upward. He evidently uses the lower surface of his gas bag as an aeroplane. Several successful exhibitions have been given with his apparatus.

Dr. Louis Martin, a professor in the University of Kolozsvár, Hungary, in a lecture at Buda-Pesth in 1893, exhibited an apparatus of rotating paddles operated from an eccentric, so that they beat down on one side, and were feathered on the rise. The pressure exerted by this mechanism was so satisfactory that the Hungarian Government has made an appropriation to enable him to continue his experiments, with a view of adapting the principle to a flying machine.

A. M. Herring, of the United States, has experimented with a great variety of aeronautical mechanisms, mostly with small models. He has made numerous mechanical birds, driven by motors of twisted rubber that rotated propellers as it untwisted, and with these he has obtained flights of five to seven seconds, with distances of 80 to 135 feet. They can be made to fly successfully in winds of not more than 7 miles an hour. One of his larger models is shown here, this weighing 5 pounds and carrying a condensing engine of two fifths horse power. It presented a surface of 14 square feet, and, with no aid in starting, flew 240 feet, and might have done better had not the boiler burst early in its career.

There is an aeronautical society in London and one in Boston, the latter growing out of an aeronautical conference, which was called in Chicago in

HERRING'S FLYING MACHINE.

1893. The society publishes an "Annual," the first issue of which appeared in 1895. A monthly publication devoted to the subject is also issued in New York city by A. M. Forney. Recent literature on aeronautics includes an exhaustive treatise by Octave Chanute, in which he elaborates and explains all the modern theories and principles developed, and describes most of the flying machines exploited within the past fifty years. Samuel P. Langley has written articles concerning the principles and conclusions derived from his investigations, and Hiram Maxim and Otto Lilienthal have also written much on the subject. Maxim, in writing on "Natural and Artificial Flight," says: "I have found that if one only desires to lift a large load in proportion to the area, the planes may be made very hollow on the underneath side; but when one considers the lift in terms of screw thrust, I find it advisable that the planes should be as thin as possible and the under side nearly flat." Octave Chanute says of the conditions of sailing flight: "1. There must be wind, although it may be light. 2. No flapping whatever is needed when under way. 3. The bird

must have a peculiar conformation. 4. The bird needs a certain mass or weight." Prof. Langley calls attention to the fact that birds soar in currents of air, and by taking advantage of increased wind speed at the higher elevations. He also advises the use of the propeller rather than flapping wings. A. M. Herring is hopeful of the future of flying machines, but not optimistic. He says they never will carry freight, and that the machine to carry two persons successfully "is an invention of the relatively distant future."

Through the efforts of various aviators and investigators in aeronautics, Mr. Lodge, of Massachusetts, introduced into the United States Senate, Dec. 4, 1895, a bill to secure aerial navigation. It provided for the giving of \$1,000,000 from the United States Treasury to the person who, prior to Jan. 1, 1901, should construct an apparatus carrying 400 pounds through the air, without the aid of gas, at a speed of 30 miles an hour, and having its power wholly within itself. A second clause provided a gift of \$25,000 to the person who, before Jan. 1, 1900, should demonstrate the practicability of safely navigating the air in free flight, for a mile or more, without gas. This bill still remains with the Committee on Interstate Commerce, to which it was referred.

AFGHANISTAN, a monarchy in central Asia, lying between Russian Turkestan and British India. The Ameer is Abdurrahman Khan, who was installed in July, 1880, while the British occupied Cabul, the capital, having expelled Shere Ali's son, Yakub Khan. The Indian Government has since paid an annual subsidy of 1,200,000 rupees per annum, increased in 1893 to 1,800,000 rupees, to enable Abdurrahman to consolidate his power and preserve a strong, united, and independent Afghanistan as a buffer state between the Russian dominions and India. The military forces of the Ameer consist of the feudal militia and the regular army, said to number 20,000. The artillery has 76 modern guns. In the arsenal at Cabul are manufactured gunpowder, cartridges, rifles, and cannon by the aid of machinery under the superintendence of Englishmen. The infantry of the feudal army have received a permanent organization. The cavalry consists of the retainers and vassals of the chiefs. In 1896 Abdurrahman Khan attempted to introduce universal conscription, and ordered the enrollment of one man in every seven, but the objections of the people induced him to defer the realization of his project. The arsenals contain breech-loading rifles enough to equip an army of 50,000 men, which is said to be the war strength of the Ameer's army.

The boundaries between Afghanistan and the Russian territory and dependent khanates have been at various times a subject of negotiations between the governments of Great Britain and Russia. In 1895 the last portion of this line, that which runs through the Pamirs, was finally delimited. The line follows the Amu Daria or Oxus river up to the confluence of the Murghab and the Panjab, and then this latter, the southern branch, up to its source in Victoria lake, from which it runs eastward to a fixed point near one of the peaks of the Sarikol range. This delimitation gives to Russia the territories of Darwaz, Roshan, and Shighnan, which Afghanistan had occupied while the question as to which was the principal branch of the Oxus, and consequently the conventional boundary, was being discussed between the British and Russian governments. In the west the boundary, leaving the Oxus at Khamiah, runs in a southwesterly direction to Zulfikar, on the Heri Rud, thence southward to the peak of Kuh Malik-i-Siyah, southwest of the Helmand river, and from there in a general eastward direction to the Kwajah Amran range. Sir

Mortimer Durand arranged with the Ameer in 1893 the basis of a boundary delimitation between Afghanistan and British India, which has since been carried out by a joint commission, with the exception of the stretch between the Khaibar pass and Asmar. By this agreement Chitral, Bajaur, Swat, and Chilas fall within the British sphere, while Afghanistan retains Asmar and the Kunar valley as far as Chanak, also the Birmal tract. The demarcation included Kafiristan in the Ameer's dominions, and when the people of this district, who differ from the neighboring Afghans in race, customs, and religion, and have always been at feud with them, refused to acknowledge his sovereignty, Gholam Haider with an Afghan army reduced them to submission.

Afghanistan is divided into the four provinces of Cabul, Herat, Turkestan, and Candahar, over each of which is a *hakim* or governor, and the recently subjugated district of Badakshan, with its dependencies. Afghans and Pathans form the bulk of the population, but with them are mingled the descendants of the former Tartar and Persian conquerors and the various armies that have invaded India through Afghanistan. The Ghilzai, Duranis, Aimaks, Uzbeks, and the Tajiks are Sunnite Mohammedans, while the Kizilbashis and most of the Hazaras are Shiites. The Tajiks, who are of Iranian descent, live in the towns and are scattered among the other tribes, carrying on industrial, commercial, and agricultural pursuits. The Aimaks and Hazaras, inhabiting the Paropamisus mountains in the north, have Tartar features and are supposed to be descendants of colonies left by Gengis Khan. The total population of Afghanistan is about 4,000,000. The Ameer's revenue is derived from the tithes of agricultural produce, increased to as much as a third of the crop on irrigated lands.

The Afghans raise usually two crops a year, one of wheat, barley, or legumes in the spring, and one of rice, millet, panicum, or corn in the autumn. Afghanistan abounds in fruits, such as apples, pears, quinces, almonds, peaches, apricots, plums, cherries, pomegranates, mulberries, grapes, and figs, which form the main part of the food of a large section of the population, and in a preserved state are exported to India and other countries. The castor-oil, madder, and asafetida plants are abundant in the wild condition. Asafetida is exported in great quantities to India. Lead, gold, iron, copper, and precious stones are found. Silk, felt, carpets, and rosaries are made by the people and exported. Horses, spices, nuts, and sheepskin garments are other exports. The principal articles of import are China tea, cotton goods, indigo, and sugar.

The Mittai Question.—Under the terms of the Durand convention of 1893 provision was made for demarcating the respective spheres of the Government of India and the Ameer. The object aimed at was to lay down definitely the law under which powers of sole control over particular tribes or clans were to be exercised on either side. The country dealt with was a long, narrow strip lying for 1,200 miles between British India and Afghanistan proper. The demarcation had been carried out by various commissions from Chitral and the Kafiristan border to the Helmand river before the beginning of 1897 with the important exception of the tract lying between the Kunar and Cabul rivers, from the Nawar Kotal to the neighborhood of Landi Kotal, in the Khaibar. This is the country inhabited by the large tribe of the Mohmands, which has figured prominently in the politics of the Indian border for many years. There were peculiar difficulties to be faced in dealing with this people, and by common consent the demarcation of the boundary of sole control in

this region was left to the last. If the Afghans had remained quiet the Ameer and the Indian Government might have been willing to postpone it indefinitely, contenting themselves with the indeterminate joint control that they had exercised for forty years, each granting allowances and punishing or rewarding tribesmen as occasion demanded. The Khan of Lalpura, who is the hereditary chief of the Mohmands, has hitherto considered himself a vassal of Cabul, though he and the tribes under his control have often transferred their allegiance from the reigning Ameer to various pretenders in times of civil war. The eastern Mohmand clans, inhabiting the country between Lalpura and the Peshawur border, have had more intimate relations with the British authorities, some of their headmen holding land within the Indian border. The Durand convention draws a line right through the tribe, dividing it in halves, one of which falls to the Ameer and one to the Indian Government. It cuts off the residence of the hereditary chief from clans directly subject to him that live within the sphere assigned to British control. In the early part of 1896 a clan of Mohmands living in a range of hills south of the Kunar river, near Asmar, fell to quarrelling among themselves. The local Afghan officials could not resist the temptation to interfere, and Gen. Gholam Haider, commanding the Ameer's troops in eastern Afghanistan, placed a strong outpost in the Mittai valley, which was on the British side of the Durand line, for the convention provided that the watershed east of the Kunar and north of the Cabul river, from Jellalabad to Kam Dakka, was to be the boundary between Indian and Afghan authority. This forward movement of the Afghan troops caused a stir in Bajaur and imperiled British influence along the new route through Swat and Dir to Chitral, where subsidized chiefs began to look with alarm for a further advance of Cabul troops, while the Mohmands and other semi-independent tribes showed signs of restlessness. The Afghans, by pushing forward their outposts, threatened, intentionally or not, to outflank the road from Malakand to Chitral. Hence the British Government was compelled to take measures of self-protection and to press for a delimitation of the frontier, which otherwise it would have preferred to leave in abeyance. All the clans on the Indian side of the Durand line were informed that they are under the sole control of the British Government. A *darbar* was brought about by Mr. Merk, the commissioner at Peshawur, at which a large number of Mohmand headmen acknowledged allegiance to the British notwithstanding the pressure exerted from the Afghan side to induce them to hold aloof from the assembly. Meanwhile the Afghan outpost still remained in Mittai at the beginning of 1897. No answer from the Ameer having been received in January to the invitation to appoint a new frontier commission, the commissioner of Peshawur issued a proclamation declaring that all Mohmand country and its border is now within the limits of the British Government and will have no connection whatever with the Ameer of Cabul. The British claimed as theirs under the Durand agreement not only the Mittai valley, but the whole of Bajaur, of which that valley forms a part. When the Afghan troops first occupied Mittai the British authorities sent a protest to Gholam Haider at Asmar that the valley was indisputably British under the Durand treaty. The Afghan general replied that the step had been taken by the Ameer's orders, and that the only way in which he could withdraw from the valley was on the instructions of his sovereign. The new British agent at Cabul, Ghafar Khan, when he went to his post in October, 1896, was the bearer of a strong letter from the Government of India on this sub-

ject, and in the course of November the Ameer replied that he was fully prepared to abide by the Durand treaty and that he recognized the watershed as the boundary, which excluded Bajaur from his dominions. For an account of the military operations on the frontier, see *India*.

ALABAMA, a Southern State, admitted to the Union Dec. 14, 1819; area, 52,250 square miles. The population, according to each decennial census since admission, was 127,901 in 1820; 309,527 in 1830; 500,756 in 1840; 771,623 in 1850; 964,201 in 1860; 998,992 in 1870; 1,262,505 in 1880; and 1,513,017 in 1890. Capital, Montgomery.

Government.—The following were the State officers during the year: Governor, Joseph P. Johnston; Secretary of State, James K. Jackson; Treasurer, George W. Ellis; Auditor and Comptroller, Walter S. White; Attorney-General, William C. Pitts; Commissioner of Agriculture, J. P. Culver; Superintendent of Education, John O. Turner; Adjutant General, H. E. Jones; Chief Justice of the Supreme Court, Robert C. Brickell; Associate Justices, Thomas N. McClellan, Thomas W. Coleman, James B. Head, and Jonathan Haralson; Clerk, Sterling A. Wood—all Democrats.

Finances.—The report of the Treasurer for the fiscal year ending Sept. 30, 1896, showed a balance in treasury at close of Sept. 30, 1895, of \$18,266.67; receipts from Oct. 1, 1895, to Sept. 30, 1896, \$1,969,930.13; total, \$2,018,256.80. By disbursements from Oct. 1, 1895, to Sept. 30, 1896, \$1,959,977.40. Balance in treasury Sept. 30, 1896, \$58,319.40. Some of the principal items of receipts were: From State taxes of 1895, \$1,245,000; special State taxes of 1895, \$115,566; poll taxes of 1895, \$145,894; licenses, \$124,821; solicitors' fees, \$22,602; sales and redemption of lands, \$22,582; express, telegraph, and sleeping-car companies, \$10,261; insurance companies' license, \$10,600; insurance companies for taxes on premiums, \$23,926; railroad licenses, \$12,500; Agricultural Department, \$45,614; Penitentiary fund, \$148,043; colleges of agriculture and mechanic arts, \$22,000. Some of the chief items of disbursement were: Salary of circuit-court judges, \$32,499; of solicitors, \$29,600; of chancellors, \$12,176; expense of geological survey, \$6,900; expense of Agricultural Department, \$47,009; interest on Agricultural and Mechanical College fund, \$20,280; interest on University fund, \$24,000; Alabama Insane Hospital, \$119,566; interest on the public debt, \$380,000; temporary loans, \$100,000; feeding State prisoners, \$80,648; military encampment, \$15,000; educational purposes, \$574,434; normal schools, \$32,000; salaries of convict officers and employees, \$27,610; expenses of convict department, \$91,299; pensions to Confederate soldiers and widows, \$115,686.

From Oct. 1, 1896, to Jan. 22, 1897, the receipts in the treasury were \$7,775 in excess of what they were during the corresponding period of the preceding year, and on Feb. 15 the State had all old obligations wiped out and a balance in the treasury of \$101,231. On June 4, 1897, the Auditor reported cash in the treasury, \$288,194.99. Liabilities: Confederate soldiers and widows, \$104,073.81; two- and three-per-cent. fund, \$189; school indemnity lands, \$4,250; convict fund, \$8,872.06; agricultural fund, \$39,540.23; colleges, agricultural and mechanic arts, \$3,003; outstanding warrants, \$15,840.81; due several counties as surplus solicitors' fees, etc., \$6,632.41; general fund balance, \$105,703.67; total, \$288,194.99. Treasury receipts from January, 1897, to date, \$1,322,221.21; disbursements (warrants), \$974,150.82; excess of receipts, \$358,070.39.

The report of the internal-revenue collector for the State for the fiscal year ending June 30, 1897,

showed a large gain over the collections made for the year previous, the total collections for the year ended amounting to \$22,000 more than the foregoing year. The following figures were given as the collections: Miscellaneous, \$5,617.05; beer, \$21,638.14; spirit tax, \$68,718.55; cigars, manufactured tobacco, and snuff, \$21,301.89; special privilege tax, \$29,721.62; total collections, \$159,001.23. The total gain was larger than ever before.

Commerce.—The annual review of the trade of the port of Mobile, published by the "Register," showed that the exports for the fiscal year ending June 30, 1897, were \$10,131,189, against \$6,995,127 for the previous year—an increase of 45 per cent. The greatest increases were in the timber and lumber trade and in the exports of cotton (foreign), the exports in cotton being 306,639 bales, against 209,944 the previous year. The statement was made that but for the lack of room in steamers the exports of cotton would have been very much larger. Cotton equal in amount to the above increase had to be refused by the steamship lines; but arrangements were being made for additional steamers. The total foreign exports of lumber amounted to 68,000,000 superficial feet, an increase of 10,000,000 feet, which increase was about the same as was noted the previous year. There were exported 1,066,528 cubic feet of hewed and 7,070,215 cubic feet of sawed timber, of the latter about 6,500,000 feet going to the United Kingdom. The total lumber exports, foreign and coastwise, was 71,228,574 feet; the total of lumber and timber in superficial feet was 209,738,490 against 162,403,106. In shingles and hard wood there was considerable increase. The receipts of grain at the port were 4,220,955 bushels, against 2,331,871 the previous year, and there were exported 2,807,225 bushels, showing that the exports of grain for the year were greater than the receipts of the year previous. The exports of flour were 20,451 barrels, and of cotton-seed meal 36,780 sacks. For the first time in her history Mobile exported pig iron from the Birmingham furnaces, the exports amounting to 52,000 tons. The Central American business of the port showed considerable increase, the Plant line handling 56,394 tons against 37,600 tons the previous year. There was a falling off in vegetable shipments from truck gardens of about \$9,000 in value. The wool business reached 225,000 pounds, an increase of 50,000 over the previous year, and an increase in value of \$15,000. There were imported 2,067,755 bunches of bananas, against 1,887,059 bunches the previous year, and the imports of coconuts were 3,405,425 against 3,398,714 the year before. Many improvements were made in wharf facilities during the year, representing about \$150,000 in value. These improvements, made by the Mobile and Ohio and the Mobile and Birmingham Railroads, will, when fully completed, double the capacity for loading steamships. The financial condition of the city was reported better than it had been for twenty years. The amount of cash on hand to the credit of the city Aug. 1 was \$55,453, an increase of \$24,779 over the previous year.

Industries.—The output of coal in 1896 was 5,743,697 tons; in 1897, about 6,000,000 tons. The total amount of coal dug every day in Jefferson County alone amounted to about 19,000 tons.

The most important discovery made in the Birmingham district since it was ascertained some years ago that Alabama coal could be coked, came to light at Leeds, where a rich vein of high-grade brown iron ore was found, 10 to 40 feet below the surface and about 10 feet thick. Forty openings were made, and in all but 3 apparently continuous leads of brown ore were exposed. It had been thought that this quality of ore existed only in

pockets and small deposits in the State. This ore analyzed from 49 to 52 per cent. of pure iron and is especially easy to flux, thus rendering it equivalent to 60-per-cent. ores.

The first run of steel by the open-hearth basic process was made July 23 at the new 60-ton steel mill of the Birmingham Rolling Mill Company. The process was the same by which low silicon pig iron, made in that district, of Alabama red ore, by the Tennessee Coal, Iron, and Railroad Company, was converted into steel at Pittsburg and Chicago. By the middle of August the Birmingham mill began regularly to use this new steel in all its departments. Theretofore steel billets had been brought from Pittsburg to be rolled in the plate and rod mills of that company. The company found a ready sale for all its product. In August 14 furnaces were in blast in the Birmingham district, making 2,700 tons of iron daily.

In March a rich bed of lead ore was discovered in the vicinity of New Market, analysis of which showed enough silver to pay for the working, aside from the large percentage of pure lead. On another tract in the same section was found a four-foot seam of coal. A company was organized to develop these fields.

Education.—The State has established 23 institutions of learning, putting at least one in each congressional district. There appears to be evidence of a general educational revival in the State, and schools, from the lowest to the highest, are reported as having been uncommonly prosperous. The State Normal College, at Troy, reports 761 students, State appropriation \$5,000, total income \$11,479, value of property \$22,500; the State normal school at Florence, 310 students, State appropriation \$7,500, total income \$14,116, value of property \$55,000; the State normal school at Jacksonville, 230 students, State appropriation \$2,500, total income \$4,906, value of property \$10,250; the Normal College for Girls, at Livingston, 138 students, State appropriation \$2,500, value of property \$15,000; the Girls' Industrial School, at Montealeo, 350 pupils, State appropriation \$15,000, value of property \$35,000. Following is a report of colored schools: Tuskegee Normal and Industrial School, 1,072 pupils; total income, \$124,723; of which amount \$77,114 was used for current expenses, and the remainder went into new buildings; value of property, \$30,000. Normal school at Montgomery, 930 students; total income, \$13,000; value of property, \$30,000. Agricultural and Mechanical College at Normal, 400 students; total income, \$30,896.

Railroads.—Associate Railroad Commissioner Ross C. Smith reported the mileage of railroads in active operation in the State at 3,625 miles, representing a taxable valuation of \$45,496,602, and furnishing employment to 14,000 men. Less than 170 miles were in the hands of receivers, while four years prior more than half of the mileage was forced into bankruptcy. The Commissioner says that "the disappearance of receiverships, and as a result the reorganization of these once insolvent roads, establishes the confidence of capitalists in the ultimate success of our railroad property and in the further development of our State resources." The gross tonnage of railroads in the State for the year reviewed was given at 11,453,443 tons, and the sum of \$2,274,215 was spent in improving the physical condition of the railroads.

Legislative Session.—One of the few important laws passed by the Legislature was that establishing a tax commission. Concerning this law, to which there was considerable opposition, the Governor is quoted as saying: "The question that confronted the General Assembly was, how to meet a

deficit, admitted by all and variously estimated at from \$225,000 to over \$500,000. There were but two ways to meet this deficit and secure a larger revenue to the State that would enable us to improve our public schools. One was by increasing the rate of taxation and compelling those who are now bearing the burdens of government to contribute more largely, and the other was to require those who have been evading just and fair taxation to contribute their share. The Legislature chose the latter plan, and I think chose wisely. To say that this act reflects upon the assessors is absurd, for it is well known that the census of 1890 shows that the taxable property of the State amounted to more than \$623,000,000, whereas the assessments for taxation amount to only \$200,000,000."

Other laws passed were:

Prohibiting combinations in rates.

Abolishing slot machines.

Prohibiting pools and gambling devices of all kinds.

Exempting capital not exceeding \$50,000 invested in the future in cotton manufacture in the State.

Among the more important general bills that failed were: The calling of a constitutional convention, the giving arbitrary powers to the Railroad Commission, and to abolish the convict lease system.

Condition of Convicts.—In March the city council of Birmingham decided to lease the city convicts to the Sloss Iron and Steel Company, who have convict stockades at Coalburg. Only those of the prisoners who had been fined \$30 or sentenced to sixty days' service, and were unable to pay their fines, were to go to the stockades. The Sloss Company offered to pay \$5 a month and board the convicts, which offer the city accepted, the aldermen saying that they were forced to take this course because of the overcrowded condition of the city prison.

Decision.—In the general revenue law passed at the late session of the Assembly there is a section levying a license tax on the capital stock of all incorporations except banks. The Phoenix Carpet Company, of Birmingham, refused to pay the tax, on the ground that the law is unconstitutional. They were arrested and convicted. An appeal was taken to the Supreme Court, which held that the law is constitutional.

Stillis destroyed.—The following is a list, by counties, of the illegal distillery outfits destroyed during the year ending June 30: Randolph, 64; Cleburne, 36; Limestone, 24; Coosa, 21; Marion, 17; Lauderdale, 16; Chilton, 14; Madison, 12; Chambers, 11; Jackson, 8; Franklin, 8; Shelby, 7; Marshall, 5; Lawrence, 5; Clay, 5; Lamar, Tallapoosa, Fayette, and Calhoun, each 4; Morgan and Winston, each 3; Dale, Cullman, Blount, Walker, and Pickens, each 2; Autauga, Perry, Macon, De Kalb, Colbert, and Lee, each 1. Total, 291. During the previous fiscal year 276 outfits were destroyed, or 15 fewer than in this year.

Lynching.—In June a committee of citizens of Decatur, bearing a petition signed by over 2,000 citizens of Morgan County, waited on Judge Speake, at Huntsville, and requested him to call a special term of court to try negroes accused of rape. The committee stated that nothing short of their request would appease the enraged populace, and that if a special term were not called the citizens of Morgan and adjoining counties would defy resistance and hang the prisoners. Without hesitation Judge Speake ordered a special term as requested, and a number of executions resulted.

In his message to the General Assembly, touching the question of lynching, Gov. Johnston said:

"I especially invite your attention to the consideration of the violation of our laws by mobs.

Where the administration of the law is wholly within the grasp of the best citizens of the State, where the sympathies of the judge and jury are entirely on the side of victims of brutal lust, no excuse justifies the spirit that would override the orderly administration of justice. All of us understand how difficult it is to restrain the passion and indignation that arouse the hot blood of relatives and friends to visit summary punishment upon those who commit the most heinous and unforgivable crime against society; but our people must be made to understand that the proper way to punish these and all other crimes is by the law of the land. The danger of inflicting punishment upon the innocent when passion and not reason holds the scales is so great that all good citizens should repress their just indignation and aid in preserving peace and enforcing the laws of the land, which are surely of sufficient severity, and I earnestly appeal to all the good people of the State to unite with us in the resolve that during this administration not a single lynching shall occur. I suggest that authority be given the Governor to call a special term of the court and have speedy investigation and trial on information whenever any crime has been committed calculated to arouse great public indignation."

Political.—At a meeting of the Democratic State Executive Committee in Montgomery in January, the following resolutions were adopted as a substitute for one providing that only those who voted the State and national tickets of the party should participate in primaries, to wit:

"Resolved, That we cordially invite all conservative voters, irrespective of past political association or differences, who can unite with us in the effort for pure and economical and constitutional government, and who will support the nominees and principles of the Democratic party, to participate in the primaries of the party throughout the State.

"Resolved, further, That all persons so participating in the primaries, or mass meetings of the party hereafter to be held, thereby pledge themselves to support the nominees of such primaries, conventions, or mass meetings, whether municipal, county, State, or Federal.

"Resolved, further, That it shall be competent for the local executive committee of each county to determine whether any other than white voters shall be allowed to participate in said primaries."

ANGLICAN CHURCHES. The forty-ninth annual report of the Ecclesiastical Commissioners represents that the income, on the whole, has been fairly maintained, a diminution in the receipts from agricultural lands, tithe rent charges, and minerals having been met by increased receipts from property in London, and by a temporary reduction in certain items of expenditure attached to the estates. For the current year a sum of £150,000 would be appropriated for the augmentation and endowment of benefices. During a period of fifty-six years, extending from 1840 to Oct. 31, 1896, the commissioners had augmented and endowed upward of 5,700 benefices by annual payments charged on the fund; by capital sums expended on the provision of parsonage houses, etc.; and by the annexation of lands, tithe rent charges, etc. The value of these grants exceeded £208,815 per annum in perpetuity, and was equivalent to a capital sum of, say, £24,320,000. The value of benefactions, consisting of land, tithe, and other rent charges, stock, cash, etc., secured to benefices, and met for the most part by grants from the commissioners, exceeded £181,940 per annum in perpetuity, and was equivalent to a permanent increase of endowment of, say, £5,458,200. A sum exceeding £26,000 per annum was also contributed by benefactors to meet the commissioners' grants for curates

in mining districts. The total increase in the incomes of bishops thus resulting from the operations of the commissioners exceeded £1,916,775 per annum, and might be taken to represent a capital sum of £20,500,000.

The number of Episcopal churches in Scotland has increased from 75 to 321 in the past sixty years. A gain of nearly 1,000 communicants was recorded in 1896.

Church Missionary Society.—The receipts of the Church Missionary Society from all sources, excluding special funds, as reported at the annual meeting in May, amounted to £297,626, exceeding those of any other former year by £25,000, and also exceeding the aggregate of general and special funds together in any former year. The excess in general contributions was £13,668, just balancing a diminution in legacies of £13,366. The associations had sent up £5,000 more than ever before. Adding special funds of £48,769 (including £7,900 for the Famine fund) the total amount contributed for all purposes was brought up to £341,400. The expenditure had risen to £297,260. A deficit was still left of £9,000. Highly five missionaries had been accepted for service. Seventy-seven hundred adult baptisms, the largest number recorded in any one year, were returned from the mission fields. The history of the society during the sixty years of the reign of Queen Victoria was referred to as calling for great thankfulness, while progress was especially conspicuous during the past ten years. A liberal response had been made to the appeal on behalf of the "Three Years' Enterprise."

The full report of the missions gives the following statistics, most of the numbers being much in excess of those of the previous year: Number of stations, 483; of European clergy, 372; of European laymen, 110; of European wives, 293; of European woman missionaries, 238; of Eurasian clergy, 20; of native clergy, 341; of native lay agents, 4,108; of native women laborers, 1,211; of baptized native Christian adherents, 203,701; of native catechumens, 29,409; of native communicants, 62,785; of baptisms during the year, 8,020 of adults and 8,399 of children; of schools and seminaries, 2,171, with 92,804 scholars and seminarists. In the medical work, 7,749 in patients and 500,674 out patients were treated. The number of missionaries sent out by the society between 1837 and 1887, the first fifty years of Queen Victoria's reign, was 900, a yearly average of 18, the average of the last ten of those years being 23. The number sent out between 1887 and 1897, between her Majesty's jubilee and her diamond jubilee, was 666, a yearly average of 66. On June 1, 1887, there were connected with the society 247 missionaries, 40 laymen, and 22 women (not including wives); on June 1, 1897, there were 376 ordained missionaries, 110 laymen, and 244 women. The advance in the aggregate number during the ten years exceeded by 114 that of the first eighty-eight years of the society's history.

Society for the Propagation of the Gospel.—The one hundredth and ninety-sixth anniversary of the Society for the Propagation of the Gospel was celebrated in London June 25, the Archbishops of York and Canterbury severally presiding at the different sessions. The secretary, reading an address of welcome, spoke of the progress of the Anglican Church since the Queen's accession as having been marvelous. In 1837 there were only 7 bishoprics owning allegiance to Canterbury, and in the United States there were only 16 sees; now the 7 had grown to 92 and the 16 to 78. In India in 1837 there were only 2, where now there were 10 sees, and the 4 natives ministering in the Church sixty years ago had increased to 300. In Australia there were now 14 sees, and in New Zealand the single-

handed labors of Marsden had led to a succession of bishops, of whom Selwyn was the chief, and there were now 6 dioceses. A like record could be made of the efforts of the Church in every part of the empire, and the society now ministered through the agency of 766 missionaries in 55 dioceses, where 54 languages were spoken. Many colonial and missionary bishops were present and took part in the proceedings by the reading of papers and reports relative to the condition of religion and the Episcopal Church in the countries of their residence. The Bishop of Calcutta spoke of "The Extension of the Episcopate and Church Organization in India"; the Bishop of Chota Nagpur, on "Missions to the Aborigines in India"; the Bishop of South Tokyo, on "The Church in Japan"; the Bishop of Korea, on missions to that country; the Bishop of Cape Town, on "The Province of South Africa"; the Bishop of St. John's, Kaffraria, on "The Church's Work among the Native Tribes of South Africa"; the Bishop of Bloemfontein on the work of the physician in the mission field; the Bishop of Grahamstown on the ministries of women in the mission field; the Archbishop of Rupertland, on "The Ecclesiastical Province of Canada"; the Bishop of Perth, on the work of the Church in Australia; the Bishop of Jamaica, on the West India province; Bishop Blyth, on "The Relations of the Anglican Church to the Churches of the East"; the Bishop of Gibraltar, on "English Congregations on the Continent"; the Bishop of Missouri, on the domestic missions of the Protestant Episcopal Church in the United States; and the Bishop of Kentucky, on the foreign missions of that Church.

Other Missionary and Benevolent Societies.—At the meeting of the United Boards of Missions of Canterbury and York held in May, a resolution was adopted inviting the Society for the Propagation of the Gospel, the Church Missionary Society, and other missionary associations in the Church of England to conference in order to consider what steps might be taken to mitigate the evils arising from the division of missionary interests and organizations. The Committee on Legal Disabilities of native Christians in India reported that after receiving evidence from the majority of the Indian bishops and from several missionaries they had found no serious disabilities for which a remedy must be sought by legislation except, perhaps, in regard to marriage; and the committee had recommended "that when both the parties in a heathen marriage subsequently profess the Christian faith they should be encouraged to make a solemn and public profession of their desire to maintain their union on the basis of Christian marriage, that a special form of service to be used in churches on such occasions should be prepared and promulgated by the synod of the Church in India, and that application should be made to the legislature to permit the registration of such public acknowledgments of the parties to the continuance of their marriage contract on the conditions which attach to marriages recognized by the Church."

The annual meeting of the Colonial Missionary Society, now sixty-one years old, was held in London May 13. Sir William Dunn, Bart., M. P., presided. The society had spent more than £4,000 during the year in colonial missionary work, but for the first time had incurred a small debt.

The income of the Colonial and Continental Society for 1896—£18,022—was £1,000 in excess of that of the previous year. An old debt of £2,000 still remained, and an additional £10,000 was needed for all purposes. Including the sums raised and spent in the colonies, the year's income rose to £39,285. An addition of £1,700 had been made to the Endowment fund, which now amounted to £6,-

834. A younger clergy and laity association had been formed, and a ladies' association was at work auxiliary to the society. Assistance was rendered by the society to churches in eastern and western Canada, Newfoundland, Australia, Madras, and British Honduras; and many outlying places depended on it for spiritual care.

The Student Volunteer Missionary Union of Great Britain since 1892 has banded together 1,300 men and women purposing to be missionaries, 300 of whom have gone into the service. It is not a society for sending out missionaries, but seeks to influence young men to devote themselves to the service of Christ in heathen and foreign lands. It besides encourages Christian students to support the work abroad "by real sacrifice, systematic missionary study, and definite prevailing prayer." An international conference held at Liverpool early in 1896 was attended by 715 students from 23 different nations.

The year's income of the Additional Curates Society was returned at £63,119, and its expenditure at £63,296. The sum of £8,000 and upward had been received for the Quinquennial fund, and this had enabled the committee to vote grants to the extent of £1,600 a year, to the great benefit of 36 parishes. The Archbishop of Canterbury said in his anniversary address that the society was at the center of a number of local societies which were independent of it, and their work must be regarded as an addition to the work that it was doing. There was, however, a great advantage in such a society, because the local societies could not undertake the work in all its fullness.

The report of the Incorporated Church Building Society, May 26, showed that 22 grants of land had been made for new churches, amounting to £2,730, 17 for mission buildings, amounting to £500, and 33 for enlarging and rebuilding churches, amounting to £1,140. The year's revenue had been £5,014, including £465 from legacies, as against £9,760 in the previous year, when the legacies amounted to £5,886.

The Church Army.—The report of the Church Army presented at the annual meeting, May 5, represented that the year had been one of great prosperity. The number of evangelists, nurses, and colporteurs had increased from 418 to 504; the number of vans had doubled; and the evangelists in charge had held nearly 1,000 seven-day parochial missions, and sold £2,248 worth of Bibles, prayer books, etc. The social department in the 47 institutions had dealt with nearly 9,000 people suffering under adverse conditions, paying them £11,000, and more than 50 per cent. of them had thus obtained a fresh start in life. The labor home work was approved by the Prison Commissioners, and the Charity Organization Society and many boards of guardians supported it with money grants. The year's income had been £77,257, including £6,171 from the sale of property and stocks; and the expenditure £70,650, including £5,000 for the purchase of consols; and instead of a deficit of £1,867 the society had a surplus of £4,749. The balance sheet showed assets amounting to £26,592, with liabilities of £719. Two diamond jubilee funds were proposed; one of £10,000 for new headquarters, and one of £5,000 for the Workers' Benevolent fund. For the current expenses of the ensuing year £85,000 were wanted, and for extension of homes, etc., £15,700. Resolutions were passed declaring that the mission work deserved greater support from the Church, and that the social and rescue work claimed the fullest co-operation of the prison and poor-law authorities.

The Church Union.—The thirty-eighth anniversary meeting of the English Church Union was

held in the Church House, Westminster, Lord Halifax presiding, June 1. The report showed that 2,277 members and associates had been added during the year, and the union now had 34,000 names on its roll, with 409 branches and 71 district unions, in addition to the Scottish Union. The expenditure for the year had been £7,614, and the treasury returned a balance of £418. A falling off was shown in the annual subscriptions. In reference to the objection lodged against the confirmation of Bishop Temple as Archbishop of Canterbury see "Annual Cyclopædia" for 1896, article TEMPLE, p. 725. No hearing was given to the protests, because no legal provision for such hearing existed; the report said that the president and council of the union had no sympathy with the objection taken, but they felt that it was a grave scandal that objections should be invited when there was no intention of hearing and adjudicating on them, even if of substantial importance and made in proper form. They believed it was an entire misapprehension of the facts to say that the Queen's bench had ruled that objections could not be heard. In the Hampden case the judges were equally divided, and therefore no *mandamus* could issue to the archbishop to hear the objections. The report further affirmed that nothing was more remarkable than the steady advance of sound Church principles on the subject of the indissolubility of the marriage bond. There were now 17 dioceses in which the bishops had been able to take effective steps to restrain their officials from issuing licenses for marriage in the case of divorced persons. It was represented during the meeting that the daily eucharist was now celebrated in 500 churches, incense was used in 337, and proper vestments in 1,032. The prejudice against confession was rapidly dying out. On the other hand, the dead were still largely forgotten in prayers, and the right to reserve the consecrated elements for the sick was not fully recognized. There was almost too much elaborate music, and visiting was greatly neglected, even in many "advanced" parishes.

At a meeting of the Church Union, April 29, a resolution was unanimously passed to the effect that the confirmation of an election to a vacant bishopric and of the person elected should be solemnly made by the archbishop in person, accompanied by such other bishops of the province as may be, and that it should no longer have the appearance of a merely formal legal ceremony; also that opportunity should be freely given for objectors to appear with their advocates with written objections in formal legal and canonical shape.

The Liberation Society.—The annual meeting of the council of the Society for the Liberation of Religion from the patronage and control of the state was held in London, May 3. Mr. F. A. Channing, M. P., presided. The report mentioned that the Evangelical Free Church Council, lately formed, had been found useful in furnishing opportunities for the advocacy, by representatives of the society, of its fundamental principles in new places or circles. The multiplication of these societies was likely greatly to strengthen the political as well as the religious influence of the free churches. As among the events of the year bearing on the work of the society were mentioned the defeat of the burials bill by a majority of only 44, Mr. Smith's motion for disestablishment, the question of mixed marriages in Malta, and the defeat of the "secularian" education bill of 1896 and the carrying of the bill of 1897. The formation of the schemes, the proceedings of the educational associations, and the course pursued by the department would need immediate and vigilant watching. The increasing demand among Churchmen for Church reform and the increasing

openness of ritualists indicated that the tendencies of the times were tending to hasten the termination of the existing distinction between the civil power and ecclesiastical bodies. As Parliament was asked to relieve the clergy in connection with local taxation, it might become necessary to resist financial charges which would practically further enslave the established Church at public expense. During the past year a Churchman's Liberation League had been established. A resolution was adopted calling upon the friends of religious liberty to decide without delay on an educational policy to be pressed upon the constituencies and upon the next Liberal administration. The year's income of the society had been £4,836, and the expenditure £4,072.

The Church Reform League.—The first report of the Church Reform League, which was presented at the annual meeting, May 10, covers only six months. It represented that substantial progress had been made in advancing the purposes of the organization. The membership was increasing rapidly, and nearly half of the present 800 members were clergymen. As to future action the council advised the concentration of all efforts on getting a short enabling act through Parliament which would "set the Church free to exercise her inherent right of constitutional self-government, subject to the control of the Crown, and in all matters of legislation subject also to the veto of Parliament." The Church could thus gradually effect all needful reforms itself, especially those connected with the position of the laity, discipline, patronage, and finance. A letter was read at the public meeting of the league from Mr. Gladstone expressing his sympathy and approval in the tentative efforts for the gradual enlargement of self-governing power in the Church, and adding: "I am far from sorry to have belonged in 1853 to the Cabinet of Lord Aberdeen which gave to Convocation its first installment of free action, a gift which had been refused by Mr. Walpole on behalf of the Government of Lord Derby in 1852. Viewing this, with other Church matters, as a whole, I am astonished at the progress made in the last fifty years, and am confident that many a 'convert' would have been arrested on the brink of his change could he have been endowed with a prophetic vision of what was to come. It also excites a lively thankfulness to observe that all this progress has been attended with a marked improvement of feeling as between Churchmen and nonconformists."

The Church Association.—The chief proposals of the scheme of Church reform recommended by the council of the Church Association contemplate, the readjustment of the incomes of the dignitaries and inferior clergy on a fairer basis than at present, and amendment of the mode of appointment of the bishops; that the Church should take part in the election of its chief pastors, and the bishop's veto should be abolished. The scheme aims at securing deprivation instead of imprisonment of clergy for disobedience, greater equality in incomes, with compulsory retirement for gross scandal, immorality, or incapacity, and provision of liberal pensions for long service and old age. It advises that the election of church wardens be restored to the parishioners and their number increased according to the size of the parish. All requisites for services should be provided by them alone. And either of them should have power to remove ornaments introduced without a faculty. It proposes that parishioners should have a veto on all appointments of parochial clergy, and the laity should have a legal franchise secured to them; that power to form parochial councils be given to the parishioners; that no change be made in the services without approval

of the parochial council; that sales of benefices by auction and sales of next presentation be abolished; that a diocesan patronage board be formed and all Crown patronage be exercised by and with its advice; that parishioners should have power to purchase advowsons of their own parish; that the freehold of the fabrics be vested in the incumbent and church wardens for the time being, but only as trustees for the parish, dereliction of duty to be a violation of trust; that the finances be controlled by the incumbent and the church wardens jointly under the direction of the parochial council; that convocation be reformed so as to secure a true representation of both clergy and laity, thus constituting a national council; and that the ecclesiastical courts be fused into the high court of justice and their procedure be assimilated to that of the civil courts.

A memorial addressed by this association to the Queen, bearing the signatures of 86,876 women, asked her Majesty when selecting future bishops to confer her patronage on those who are opposed to the efforts being made to revive the confessional and to restore the sacrifice of the mass, which her Majesty on her accession to the throne publicly declared to be both "superstitious and idolatrous."

Church Defense.—The Church Committee for Church Defense and Church Instruction was formed in the autumn of 1896 by the amalgamation of the Church Defense Institution and the Central Church Committee. The work of education and organization performed previous to the union by these two bodies is now continued and carried on by the amalgamated body, which, with the assistance of the diocesan and other local committees, is endeavoring to extend the field of its operations throughout the whole of England and Wales. The receipts of the two bodies during 1896 amounted, including two special gifts of £2,000 and £1,200 respectively, to £12,548, while the expenditure was £13,289. The work of the societies proceeded without interruption through the negotiations for union during the whole year. The general committee, at its annual meeting, April 6, by resolution, reaffirmed the necessity for continued and extensive organization in defense of the Church and of the dissemination of information among all classes as to its origin, history, and work. The Archbishop of Canterbury addressed the meeting in reference to methods in which boys could be taught and encouraged to learn concerning Church matters.

Home Reunion Society.—The report of the Home Reunion Society, presented in June, represented that there were many signs of an advance toward that outward unity which must eventually be accomplished. Wherever social barriers had been removed a more friendly response was now assured in all communications with Nonconformists. Avoidance of overlapping in the mission field was also mentioned as a means of promoting a better understanding.

Christian Knowledge Society.—At the general meeting of the Society for promoting Christian Knowledge, Oct. 5, grants amounting to £4,944 were voted for the building of 39 churches and schools in Canada, British Columbia, the West Indies, South Africa, Mid-China, Australia, New Zealand, etc.; for scholarships for the training of Canadians for holy orders and for studentships for Christian girls in India; also £1,000 for an endowment fund for clergy in the poor diocese of Algoma, and £2,000 for the maintenance of the medical work of the society in India. Grants of publications were made for various institutions at home and abroad, the aggregate value of which was placed at £1,158.

Church-of-England Temperance Society.—A letter addressed by the Archbishops of Canterbury and York and the Bishop of Chichester, Chairman of the Church-of-England Temperance Society, to the clergymen of England, commended the society and the temperance cause, inviting them to form branches of the society in their several parishes, and earnestly asking them "to consider the question and see whether it may not help at any rate some of your people to a higher and better life if they can find assistance to overcome what may perchance be a besetting sin. If not an adult branch, perhaps you can establish a Band of Hope. The training of the young in habits of temperance (self-control) is of the greatest importance to the future well-being of the nation, and this can be best accomplished, at any rate as regards drink, by means of the Band of Hope. We would only urge you not to pass the matter by as one of no importance. It is the experience of most parish priests who have tried it that organized temperance work is the greatest possible help to a due discharge of the spiritual functions committed to them."

Ministry of Women in the Church.—A conference on the organization of women ministries in the Church was held at the Church House, Westminster, July 21, the Bishop of St. Andrew's presiding. The chairman referred to the great influence exercised by women in the present day, and said it was recognized by thoughtful men of every school as one of the leading ideas of the nineteenth century. Canon Body gave an address on "Woman's Place in the Church," and the Bishop of Grahamstown followed with one on "The Sisterhood Life." The Bishop of Stepney said that he favored the suggestion that deaconesses should hold a high position as ministers of the Church, and he was disposed to support the taking of vows.

The Right of Public Meeting.—The Rev. H. L. Young, rector of St. John's Church, Portsea, having been advertised to take part in a public meeting in connection with the Portsmouth and South Hants Protestant Association, the Bishop of Winchester addressed him a letter deploring the fact of his choosing such an occasion and mode of action to protest against ritualism in the Church of England. Mr. Young replied, admitting his intention to participate in the meeting, and explaining that the Baptist chapel was chosen merely as a matter of convenience, and expressed surprise at the bishop's writing on such a matter, seeing that he was acting within the civil and religious liberty given him by the Crown. As regarded the lay members of the Church of England, it was a pure assumption on the part of the bishop to imagine that he could in any way restrict their liberty of public meeting. It was also surprising that the bishop could have written to him, as he not only could tolerate in the parish of Cosham, where the meeting was about to be held, the most shameful ritualistic practices and lawlessness, but similar proceedings took place in other churches of his diocese. Recently, at a confirmation service at St. Agatha's, the bishop had taken part in a procession and was preceded by acolytes with lighted torches, thus not merely aiding lawlessness, but treating with contempt the decisions of her Majesty's judges. The writer concluded by saying that if the bishop had kept his episcopal contract with the realm to banish strange and erroneous doctrines contrary to God's word, there would be no occasion for him to address the meeting at Cosham or for the bishop to write him a letter criticising him for so doing. Mr. Young attended the meeting and addressed it, denouncing ritualistic practices in the Church. The Rev. T. Stranger, vicar of Christ Church, Potsdown, who had re-

ceived a similar letter from the bishop, also attended the meeting.

Defense of Anglican Orders.—The reply of the archbishops to the statement of the Pope denying the validity of Anglican orders was published as a general letter, March 2. The archbishops begin by speaking of the serious nature of the duty imposed upon them as "one which can not be discharged without a certain deep and strong emotion. But, since we firmly believe that we have been truly ordained by the Chief Shepherd to bear a part of his tremendous office in the Catholic Church, we are not at all disturbed by the opinion expressed in that letter." They then point out that, with respect to the form and matter of holy orders, "it is impossible to find any tradition on the subject coming from our Lord or his apostles, except the well-known example of prayer with laying on of hands, and that little is to be found bearing on this matter in the decrees of provincial councils, and nothing certain or decisive in those of oecumenical and general assemblies. Nor, indeed, does the Council of Trent, in which our fathers took no part, touch the subject directly." The whole judgment of the Pope, the answer continues, "hinges on two points—namely, on the practice of the court of Rome and the form of the Anglican rite, to which is attached a third question, not easy to separate from the second, on the intention of our Church. We will answer at once about the former, though it is, in our opinion, of less importance. As regards the practice of the Roman court and legate in the sixteenth century, although the Pope writes at some length, we believe he is really as uncertain as ourselves. We see that he has nothing to add to the documents which are already well known." Certain documents cited by the Pope and their bearings are reviewed, and the archbishops acknowledge with the Pope that the laying on of hands is the matter of ordination; that the form is prayer or blessing appropriate to the ministry to be conferred; "that the intention of the Church, as far as it is externally manifested, is to be ascertained, so that we may discover if it agrees with the mind of our Lord and his apostles and with the statutes of the universal Church. We do not, however," they add, "attach so much weight to the doctrine . . . that each of the sacraments of the Church ought to have a single form and matter exactly defined, nor do we suppose that this is a matter of faith with the Romans." Baptism stands alone as a sacrament in being quite certain both in its form and its matter; and as to confirmation, "if the doctrine about a fixed matter and form in the sacraments were admitted, the Romans have administered confirmation imperfectly, and the Greeks have none." Responding to that part of the Pope's bull that deals with the question of intention, the archbishops show and maintain that "if, according to the Pope's suggestion, our fathers of the year 1550 and after went wrong in the form by omitting the name of bishop they must have gone wrong in company of the modern Roman Church," and quote words immediately following in the original which are used by St. Paul in reference, they believe, to the consecration of Timothy as bishop as sufficiently meeting the purpose. "The form of ordering a presbyter employed among us in 1550 and afterward was equally appropriate. . . . The two commissions taken together include everything essential to the Christian priesthood, and, in our opinion, exhibit it more clearly than is done in the sacramentaries and pontificals." When, in 1662, the addition for the office and work of a priest "was made, it would not seem to have been done in view of the Roman controversy, but in order to enlighten

the Presbyterians, who were trying to find a ground for their opinions in our prayer book," the Church of England's debate then being much more severe with them and other innovators than it was with the Romans. In answer to other assertions of the Pope against the intentions of the Church, the archbishops quote the title of the ordinal of 1552, which ran, "The fourme and maner of makynge and consecravyng Bishoppes, Priestes, and Deacons," and the words of the preface enlarging this phrase and emphasizing its meaning as quite clearly setting forth that intention "to keep and continue those offices which come down from the earliest times, and 'reverently to use and esteem them' in the sense, of course, in which they were received from the apostles, and had been up to that time in use." The argument is closed with a reiteration of the charge that in overthrowing the English orders by the denial of their validity in the shape in which he has made it the Pope "overthrows all his own, and pronounces sentence on his own Church." Finally, the archbishops declare themselves equally zealous with the Pope in their devotion to peace and unity in the Church. "We acknowledge that the things which our brother Pope Leo XIII has written from time to time in other letters are sometimes very true and always written with a good will. For the difference and debate between us and him arises from a diverse interpretation of the self-same Gospel which we all believe and honor as the only true one. We also gladly declare that there is much in his own person that is worthy of love and reverence. But that error, which is inveterate in the Roman communion, of substituting the visible head for the invisible Christ will rob his good works of any fruit of peace. Join with us, then, we entreat you, most reverend brethren, in weighing patiently what Christ intended when he established the ministry of his Gospel. When this has been done more will follow as God wills in his own good time."

Many protests were uttered against the tenor of this letter and the point of view from which the question was regarded in it by persons and societies maintaining Protestant principles. The National Club Association and the Protestant Reformation Society issued a declaration that (1) "while holding firmly the validity of the orders of the Church of England, we yet unhesitatingly maintain that her ministers are simply presbyters and not priests; (2) that the statements put forth by the Archbishops of Canterbury and York in reply to the papal bull concerning Anglican orders on the subject of the 'priesthood' and 'the eucharistic sacrifice,' as well as on other points, are not in harmony with the doctrine of the Church of England, as set forth in the articles, liturgy, and ordinal; and we record, therefore, our solemn and deliberate protest against these statements as being nothing more than private and unauthorized opinions of the two archbishops; (3) that, as a matter of fact, neither sacrificing priest, altar, nor propitiatory sacrifice is to be found in the legal standards of our Church, which embody only the 'Protestant Reformed religion established by law'; and further (4), that we deprecate any attempt on the part of individual bishops to negotiate terms of communion with foreign churches."

The Committee of the Irish Church Missions in June unanimously adopted a minute concerning the letter, in which they expressed themselves constrained, "with the deepest sorrow, to declare it to be as a whole, both in matter and tone, unworthy of the Protestant and Reformed Church of England. That it should have emanated from the two archbishops of the Church is, in the opinion of the committee, a fact of solemn and portentous signifi-

cance in view of the prevalence of sacramentarian and sacerdotal teaching. The committee feel it to be incumbent upon them to record their solemn protest against the unscriptural views advanced by the archbishops on the doctrine of the Lord's Supper, as well as the attempt to claim for clergymen of the English Church the position and functions of sacrificing priests—a dogma absolutely without sanction in the standards of the Church or in Scripture, and in support of which an attempt is made to minimize the significance of the changes made in the ordinal at the Reformation."

A letter addressed by the council of the National Church Union, in June, to the Archbishops of Canterbury and York, expressed the reasons of that body for being unable to agree with certain statements contained in the answer. After discussion of the points of the letter in detail, the letter concludes: "The council regard it as a reason of profound regret that your lordships have not in these particulars adopted the interpretation of the formularies of the Church of England followed by the great body of her leading divines ever since the Reformation, and which would have commanded the cordial support of every loyal Churchman. The adoption, on the contrary, of an interpretation in favor only with an extreme and comparatively modern school of theologians can not but further increase our present unhappy divisions, while any attempts to render such an interpretation authoritative would rend the Church in twain. It is with the utmost regret that the council are constrained to dissent from statements publicly set forth by the archbishops of their Church; and they trust that your grace will accept their assurance that nothing but the most solemn sense of responsibility to God and the Church would have induced them to undertake this painful duty."

A petition addressed to the Queen, in July, by the Church Association, invited her Majesty's attention "to the recent public action of their Graces the Archbishops of Canterbury and York in taking upon themselves to address the heads of the corrupt Latin and Greek Churches, thereby claiming independent authority to speak in the name of the established Church of this country, and also to the fact that they have attempted to justify their action by misquoting the legalized formularies of our Church, while adducing, as authoritative, documents which have no official character." The memorialists prayed that the Queen would, in accordance with her coronation oath, be pleased to maintain the Protestant faith within the realm, and to require explanation from the archbishops as to their unauthorized action in thus encroaching upon the royal prerogative.

Convocations of Canterbury and York.—In the Convocation of Canterbury the upper and lower houses, at the meeting in January, agreed upon provisions to be recommended for enlarging the representation of the clergy by increasing the number of proctors. The upper house unanimously requested the archbishop to take such steps as were necessary for elucidating or amending the use now observed in confirming the election of bishops. The president (archbishop) on presentation of this petition to him intimated that the house had decided that it was not the business of convocation to deal with that matter, and that therefore the petition could not be received. On this subject the House of Laymen unanimously resolved that the form of confirmation of bishops as recently carried out should be altered so as, on the one hand, to prevent the scandal of calling for opponents and then refusing to hear them, and, on the other hand, to safeguard the Church of England in the appointment of fit persons to her bishop-

ries. A resolution adopting the scheme of the Clergy Central Sustentation fund as the Church's memorial of the Queen's reign was adopted by both the upper and lower houses. The subject of the marriage laws, with special reference to the conflict as to some points between the civil and the ecclesiastical laws, was considered in the upper and lower houses. The House of Laymen resolved to approve any bill that would place limitations on the transfer and exercise of patronage, and would provide safeguards against the institution to benefices of men not fit to be incumbents, while it should protect both patron and presentee from possible injustice by insuring full trial before a competent and final tribunal, and which should provide against gross neglect of duty.

At the meeting of the convocation, May 11, the archbishop spoke in the upper house of the voluntary schools act, in respect, first, of the area of the association created by it. The education department were not prepared to accept a small area, and would prefer to deal with associations embracing not fewer than 200 schools. This pointed to the diocese constituting the area of the association, and it was of very grave importance that diocesan associations be established as soon as possible. The department would allow cooptation to the governing board, and that would enable them to include on the board those officers of the Church whom they would all like to see connected with the management of such associations—such, for example, as the bishop, the archdeacons, and the proctors in convocation. It would be a great gain if these associations should in time become the educational authorities of the Church. On the question of what schools should be admitted to the associations, the archbishop's opinion was very decidedly that they should be Church of England schools only. The Roman Catholics would refuse to join any such associations, even if they were invited to do so. The Wesleyans were contemplating the formation of associations, and those who preferred undenominational education would doubtless form their own. It was best they should do so. The archbishop also mentioned the formation of a secondary educational council to be constituted in accordance with the terms of a report presented to both houses in July, 1896. Had such a council been in existence before, the Welsh intermediate educational act would probably never have been passed.

Resolutions were adopted commending the formation of parish councils as a thing that would tend to quicken the life and strengthen the work of the Church; and advising that the initiative in forming such councils should rest in the incumbent, subject to the approval of the bishop, and that they should consist of the church wardens and duly appointed sidesmen, together with elected councillors. In view of legislation for enforcing retirement on the clergy, an inquiry was recommended whether a scheme of adequate pensions could not be provided which should not diminish the income of the benefices vacated, and whether the principle and organization of the Clergy Pensions Institution might not be adopted in any such scheme with advantage to the Church.

The lower house expressed its approval of the benefices bill before Parliament, with the qualification that it should be made clear that power is given in the bill to a commission to enforce the attendance of witnesses and to examine them upon oath. It asked the archbishop and the upper house to consider whether any and, if so, what steps could be taken by the Church to recognize teachers of its own communion "desirous of such recognition as holders of a spiritual calling and to create a closer bond of union among all such teachers." Another

resolution requested the archbishop to appoint a joint committee on special prayers and services.

The House of Laymen in May adopted a vote of thanks to the archbishop "for vindicating the position and rights of the Church of England and defending the Anglican communion in the recent encyclical letter addressed by his Grace and the Archbishop of York to the bishops of the Catholic Church." A report was adopted on the increase of the episcopate proposing the foundation of four new dioceses, and in connection with it a resolution "that no arrangement of the sees in and near London can be regarded as satisfactory or final which does not fully recognize the responsibility of the metropolis for the spiritual need of those populations belonging to it but living beyond its borders." A report on the conditions under which religious instruction should be imparted to the children of Church parents recommended that action be set on foot in each diocese to charge, if possible, some existing diocesan organization with the duty of caring for the interests of Church children in reformatory and industrial schools, and that steps be taken to inform the minds and rouse the consciences of churchmen on the subject.

The house by resolution expressed its opinion that "the Church of England should, saving the supremacy of the Crown and subject to the veto of Parliament, have freedom for self-regulation by means of reformed convocations, with the assistance, in matters other than the definition or interpretation of the faith and doctrine of the Church, of a representative body or bodies of the faithful laity."

In the Convocation of York, the House of Laymen, April 27, besides various expressions respecting voluntary schools and concerning the benefices bill and the Queen Victoria Clergy Sustentation fund, unanimously passed a vote of thanks to the archbishop "for the vindication of the rights of the clergy of England and the defense of the Anglican communion, contained in the recent encyclical letter addressed by his Grace and the Archbishop of Canterbury to all the bishops of the Catholic Church."

The Convention of York, at its meeting in June, adopted a resolution urging measures to check the spread of contagious diseases among the soldiers in India; also a resolution recommending the inclusion in any measures for the compulsory retirement of incapacitated incumbents, of provisions for dealing on similar lines with incapacitated bishops, deans, archdeacons, and canons. A remedy was demanded for the injuries occasioned to tithe owners by the operation of the agricultural land-rating act, 1896.

The Lambeth Conference.—One hundred and ninety-nine bishops accepted the invitation to attend the Lambeth Conference. A reference to the numbers at former conferences shows that there has been a steady and marked increase since the first Lambeth Conference was held. Thus in 1867 76 bishops accepted the invitation of Archbishop Longley "to meet together for brotherly counsel and encouragement." The second conference was held in 1878 at the invitation of Archbishop Tait, which was accepted by 108 bishops, of whom 100 were able to attend. The third conference, which took place in 1888, was summoned by Archbishop Benson, and was attended by 145 bishops.

The devotional services which had been arranged for the opening day of the conference were held June 30, beginning with the celebration of the holy communion at Lambeth Palace Chapel. On July 1 an evening service was held at Westminster Abbey, with a sermon by the Archbishop of York. On July 3 the bishops visited Ebb's Fleet, Isle of

Thanet, the spot where St. Augustine is said to have landed when he went to England under the direction of Pope Gregory to preach the Gospel to the then heathen people. A service was held at the cross erected by the late Lord Granville in memory of St. Augustine—a simple memorial of gray stone bearing a Latin inscription which set forth the fact of St. Augustine's landing. After this the bishops went to Richborough, where they were entertained by the trustees of the castle, and visited the extraordinary Roman remains. On July 3 special services were held in Canterbury Cathedral, with an address of welcome by Archbishop Temple; after which a visit was paid to St. Martin's Church, supposed to be the oldest parish in England and to have been the place of worship attended by Queen Bertha, wife of King Ethelbert, at the time of the coming of Augustine. The words chanted by Augustine and his party as they entered Canterbury were sung as an anthem by the choir. Another service was held at the cathedral, which was attended upon invitation by representatives of nonconformist bodies and civil officers.

The regular sessions of the conference were begun in Lambeth Palace, July 5, and were continued as general meetings till the 10th, when they were suspended, in order to give the committees opportunity to meet and consider the matters presented to them, till July 21. At these general meetings papers were presented and formally discussed: "On the Organization of the Anglican Communion—(a) as a Central Consultative Body; (b) a Tribunal of Reference; (c) the Relation of the Primates and Metropolitans in the Colonies and elsewhere to the See of Canterbury; (d) the Position and Functions of the Lambeth Conference"; "The Relation of Religious Communities within the Church to the Episcopate"; "The Critical Study of the Holy Scriptures"; "Foreign Missions—(a) the Duties of the Church to the followers of (I) Ethnic Religions, (II) Judaism, (III) Islam; (b) Development of Native Churches; (c) Relation of Missionary Bishops and Clergy to Missionary Societies"; "Reformation Movements on the Continent of Europe and Elsewhere"; "Church Unity in its Relation (a) to the Churches of the East; (b) to the Latin Communion; (c) to Other Christian Bodies"; "The Office of the Church with Respect to Industrial Problems—(a) the Unemployed; (b) Industrial Co-operation"; "Degrees in Divinity"; "Additional Services"; "Local Adaptation of the Prayer Book." A fraternal message was received from the General Assembly of the Church of Scotland. As in accordance with the invariable rule of the conference no corporate answer could be returned to this address, the Archbishop of Canterbury undertook, with the approval of the conference, himself to write expressing appreciation of the brotherly message. A special reception was given the bishops by her Majesty the Queen, at Windsor, July 13.

The bishops attending the Lambeth Conference met again at Lambeth, July 22, to receive and consider the reports of the various committees which had been sitting at the Church House and to adopt formal resolutions upon them. A memorial resolution of the late Archbishop Benson of Canterbury was adopted, in which mention was made of the fact that "up to the latest moment of his life his thoughts were given to the defense and maintenance of the principles of the Church of England. 'There is not a break anywhere in our orders, sacraments, creeds, scriptures, spiritual gifts, in all that compacts and frames the holiness of the catholic and apostolic Church of the ages.' These were his last words, written just before he passed, in the act and attitude of worship, after the early eucharist, through the confession and under the very utter-

ance of the absolution, to receive the seal of divine favor and forgiveness."

The results of the conference were given to the public in the forms of an encyclical letter reviewing the whole; of the 63 resolutions for which the conference held itself responsible, and the tenor of which is summarized in the encyclical; and the reports of the committees which, it is explained, represent the mind of the conference in so far only as they are reaffirmed or adopted in the resolutions. The encyclical letter, following the course of the resolutions in a general way, considers the subjects of temperance and purity, in both of which it is urged that the religious aspects and religious control should be made most prominent; the dignity and sanctity of marriage; industrial problems, in which the brotherhood of man should be regarded; duty to the poor; and international arbitration. Of ecclesiastical subjects (which are the first presented in the resolutions), the first is the organization of the Anglican communion, with provision for steady and rapid intercourse between the several branches for the development of unity of feeling; a central consultative body, to supply information and advice, but without other than moral authority, under charge of the Archbishop of Canterbury; and the formation of provinces with archbishops, so that no bishop should be left to act absolutely alone. Religious communities are commended in a general way as capable of rendering great service to the Church, but are acknowledged to need more regulation. The critical study of the Bible by competent scholarship is strongly commended as essential to the maintenance in the Church of a healthy faith. The Book of Common Prayer should not be tampered with in matters of doctrine, but can not possibly provide for all needs in every variation of local circumstances, and a limited discretion is recommended to be given to local bishops to make provision for such emergencies. The necessity for increased facilities for theological study in colonies and dependencies is insisted upon, in order that preachers may be properly armed for the defense of the Church and its doctrines. Christian care of emigrants and the defense of native races from demoralizing influences are urged. The letter approves the opening of correspondence with the Churches of the East; the cultivation of friendly relations with the Moravians and with the Scandinavian Church; the emphasis of the divine purpose of visible unity among Christians as a fact of revelation; advises the appointment of committees of bishops everywhere to promote united prayer and mutual conference between representatives of different Christian bodies; and recognizes the endeavors of the Old Catholics and other bodies "to escape from the usurped authority of the See of Rome." Although "such movements may sometimes end in quitting not merely the Roman obedience, but even the Catholic Church itself, and surrendering the great doctrine of the sacraments, or even some of the great verities of the creeds, . . . we must not anticipate that they will do wrong until they have begun to do so." Foreign missions are treated with respect to the conditions to be met in dealing with the Jews, with the Mohammedans, and with the other religions. While the Jewish, Mohammedan, and the other religions are admitted to have some good deserving recognition, "it is necessary to be cautious lest that good, such as it is, be so exaggerated as to lead us to allow that any purified form of any one of them can even in any way be a substitute for the Gospel. The Gospel is not merely the revelation of the highest morality; it reveals to us also the love of God in Christ, and contains the promise of that grace given by him by which alone the highest moral life is possible in man." While

collisions in foreign missions between different branches of the Anglican communion are deprecated, the avoidance is also advised of obstacles to the growth of unity as to other communions so far as possible without sacrifice of principle.

On some of these subjects the expressions of the resolutions are more specific and formal. Concerning the conference itself, they recommend that similar meetings continue to be held every ten years; that their resolutions be communicated to the various national churches, provinces, and extra-provincial dioceses of the Anglican communion for their consideration, and for such action as may seem to them desirable. They deem it advisable that "a consultative body should be formed, to which resort may be had, if desired, by the national churches, provinces, and extra-provincial dioceses of the Anglican communion, either for information or advice, and that the Archbishop of Canterbury be requested to take such steps as he may think most desirable for the creation of this consultative body." They regard the revival of the custom of attaching the title of archbishop to the rank of metropolitan as justifiable and desirable, and advise that the proposed adoption of such a title be formally announced to the bishops of the churches and provinces of the communion.

"Where it is intended that any bishop-elect, not under the metropolitan jurisdiction of the See of Canterbury, should be consecrated in England under the Queen's mandate, it is desirable, if it be possible, that he should not be expected to take an oath of personal obedience to the Archbishop of Canterbury, but rather should, before his consecration, make a solemn declaration that he will pay all due honor and deference to the Archbishop of Canterbury, and will respect and maintain the spiritual rights and privileges of the Church of England and of all Churches in communion with her. In this manner the interests of unity would be maintained without any infringement of the local liberties or jurisdiction.

"If such bishop-elect be designated to a see within any primate or provincial jurisdiction, it is desirable that he should, at his consecration, take the customary oath of canonical obedience to his own primate or metropolitan."

Besides recommending comity as to missionary work among Anglican churches, the resolutions advise "that in the foreign mission field of the Church work, where signal spiritual blessings have attended the labors of Christian missionaries not connected with the Anglican communion, a special obligation has arisen to avoid, as far as possible, without compromise of principle, whatever may tend to prevent the due growth and manifestation of that unity of the spirit which should ever mark the Church of Christ." The movement for the formation of an autonomous church in Mexico is recognized in the resolutions. Sympathy is expressed with the reformatory movements in Brazil, France, Italy, Spain, and Portugal; the Archbishops of Canterbury and York are requested to confer with Eastern Churches for the purpose of promoting closer relations with them; inquiry is recommended concerning the orders of the Moravian Church (*Unitas Fratrum*) and concerning the validity of the orders of the Swedish Church; further, the bishops of the several churches of the Anglican communion are urged "to appoint committees of bishops, where they have not been already appointed, to watch for opportunities of united prayer and mutual conference between representatives of different Christian bodies, and to give counsel where counsel may be asked in this matter; that these committees confer with and assist each other, and regard themselves as responsible for reporting to the next Lambeth

Conference what has been done in this respect." The Archbishop of Canterbury was requested to take such steps as may be necessary for the retranslation of the *Quicumque Vult* of Athanasian Creed).

After the close of the conference the bishops visited the ruins of Glastonbury Abbey, which is believed to have been erected on the site of the first Christian church built (of wattles) in England, according to tradition, by Joseph of Arimathea, and held services commemorative of the event.

The Church Congress.—The thirty-seventh Church Congress met at Nottingham, Sept. 28. The preliminary sermons were preached by the Archbishop of Canterbury and the Bishops of Calcutta, Iowa, and Argyll and the Isles. The Bishop of Southwell presided at the congress, and referred in his opening address to the jubilee of the Queen, the Church schemes of the late Archbishop Benson, the Lambeth Conference, industrial problems, the anticipated range of topics to be discussed by the conference, and the missionary character of the body. The subjects considered in the discussions, in appointed papers, and voluntary addresses included "The Organization of the Anglican Communion," by Bishop Barry; "Methods of Theology" ("Inductive," by Sir G. G. Stokes and Archdeacon Wilson; "Historical," by the Rev. A. C. Headlam and the Rev. Dr. Sanday); "The Book of Common Prayer"; "The Progress of Life and Thought in the Church of England during the Victorian Era" (the Bishop of Ripon speaking on the factors which had been at work in this progress; the Rev. Dr. Moule, on the "Contribution of the Evangelical Movement to the Life and Thought of the Church"; and the Rev. J. Llewellyn Davies, on "The Element contributed by Broad Church Teaching"); "Foreign Missions" (treated under the several heads of the development of native churches, the comity of independent missions in the same district, women's work, and medical missions); "The Church and Dissent"; "The Church in India and the Colonies" ("The State in Relation to the Church in India," by Sir T. C. Hope; "The Organization of Mixed Races in a Church," by the Bishops of Natal and Iowa; and "The Duty of the Church of England to the Colonies," by the Archbishop of Sydney); "Art and Architecture in the Service of the Church"; "Church Reform" ("Freedom of Legislation for the Church," by the Rev. Dr. Fry and others, and "Methods of Preference and Patronage in the Church of England, compared with Other Existing Methods and considered in Reference to the Actual Circumstances of the Church," by the Archdeacon of London and others); "National Education" ("University Education, the Organization of the School System, and Religious Instruction," by the Bishop of Hereford; "The Limits of Primary and Secondary Education," by Dr. Gow; and "The Formation of Educational Councils," by the Archdeacon of Exeter); "Industrial Problems" ("Poor Law," by Mr. Geoffrey Drage, M. P.; "The Duty of the Clergy in Regard to Trade Disputes," by Mr. E. Bond, M. P.; "Methods of Conciliation," by Canon Moore Ede; and "The Christian Social Union," by the Rev. J. Carter). At a devotional meeting papers were read on "Prayer in Relation to Personal Life and Holiness" (the Bishop of Lincoln); "The Doctrine of the Incarnation as determining the Character of the Church and the World"; "The Influence of the Doctrine of the Incarnation on the Christian Ministry" (the Dean of Norwich); and "The Devotional Aspect of Missionary Work" (the Bishop of Grahamstown). Other subjects were "Practical Religion in Citizenship, in Commerce, and in Other Business Relations" and "The Supply and Preparation of Candidates for Holy Orders, and the

exceeding the supply of suitable men and money." *—* *Archæology.*

The annual church meeting was largely attended, and was presided over by the Archbishop of Capatzen, assisted by Hugh Grell, M. P., and the Dean of the diocese. Meetings were held for men of business and for women. At an evening meeting.

Archbishop Benson's last two proposals for the organization and maintenance of the Church—Church Defense and Church Protection Committee and the Queen Victoria Stipendiary Fund—were discussed by Lord Balmorais, M. P., the Dean of Norwich, and others.

ARCHAEOLOGY. American. Magnitude of Mexican Ruins.—Of the ruins of ancient cities in Mexico, which Mr. W. H. Holmes has examined and described in his publications respecting them, none, perhaps, are more remarkable and extensive as a whole than those near the city of Oaxaca. Many of the important works here are found on mountain tops, "and once you come," he says, "to rec-

entel not a trace of natural contour remained. There was a vast system of level courts inclosed by successive terraces and bordered by pyramids on pyramids. Even the sides of the mountain descended in a succession of terraces." The ruins of San Juan Teotihuacan are described by Mr. Holmes as surpassing in magnitude and in the evidence they afford of a vast ancient population those of any of the other ancient cities of Mexico. The site "lacks the well-preserved, sculpture-decorated buildings found elsewhere in Mexico and Central America; . . . but if the entire mass of the ruined structures of either Chichen, Uxmal, or Mitla was to be heaped up in a single mound, it would hardly surpass the great pyramid of the Sun alone in bulk, and the whole bulk of the Teotihuacan remains is many times that of its chief pyramid."

Ruins of Quechmictoplican.—Some important ruins have been explored by Mr. W. Niven, of New York, at the ancient city of Quechmictoplican, about 40 miles northeast of Chilpancingo, capital of the

FIG. 1. ONE OF THE TEMPLES AT QUECHMICTOPLICAN, MEXICO.

ognize the matched profiles of the ridges and peaks that border the valley as being due to the strangely directed enterprise of the ancient inhabitants. . . . As the explorer climbs the slopes and picks his way from summit to summit he is fairly dazzled by the vast array of pyramids and terraces, which not only crown the heights, but overspread the steep slopes, destroying traces of natural contour, and making the mountains actual works of art." Climbing one of the larger pyramids of the group on the summit of Monte Alban, the author obtained a panoramic view of the mountain and the surrounding valleys and ranges, of which he says: "The crest of Alban, one fourth of a mile wide and extending nearly a mile to the north, lay spread out at my feet. The surface was not covered with scattered and desolate piles of ruins, as I had expected, but the whole mountain had been remodeled by the hand of man

State of Guerrero, Mexico. On a preliminary expedition in search of the site of this city Mr. Niven found it very difficult of access, but, having reached it, discovered ruins denoting a city of very considerable extent. He returned to New York, and, having made his preparations and secured a provision of means, started in August, 1896, for a thorough exploration of the ruins. He describes them as occupying an area about as great as that of the city of New York, and as betokening not an extreme antiquity. Twenty-two temples and numerous altars, forming the principal monuments of the city, were recognized. The bases of the altars—large pyramids of adobe—were distinguished in all parts of the city. The temples were generally built of stones, of large dimensions, carefully squared. Of many the foundations alone remained. In other cases the walls rose a few feet,

Some of the temples covered surfaces of 600 square feet. In the center of them was always seen an altar from 5 to 20 feet high, and averaging 15

FIG. 2.—SCULPTURED HEAD IN STONE, QUECHMICTOPILCAN, MEXICO.

feet square in the base. In the temple of which a representation is given in Fig. 1 the steps, arabesques, and windows offer numerous analogies with the buildings at Uxmal, Labna, Kabah, and Chichen-Itza. But no hieroglyphics of the style

FIG. 3.—HIEROGLYPHIC SIGNS, QUECHMICTOPILCAN, MEXICO.

nately broken by a workman. Underground passages seemed to be more numerous than in any other American city. At Organos and at Tejas

Mr. Niven discovered numerous holes filled up with deposits of ash, and found pottery wares belonging to quite different periods. At Nuchucatan he found a head sculptured in stone, measuring 7 feet in length. The face is expressive and the singular headdress of a style not before known (Fig. 2). At Texcal the whole edifice was under examination and the excavations have so far not uncovered the slabs that formed the roof. Everywhere, in the temples, as in the caverns, the experts collected in the masses of rubbish and pottery bowls, jasper cat-drops, masks, rings, amulets, and ornaments of every sort in jade or enamel.

While the numerous bas-reliefs (columns or slabs) bore no inscription, one of them something that suggested hieroglyphic signs could be distinguished (Fig. 3). Human bones were piled up in an ossuary at least 20 feet long. A few skulls were recovered intact, but they fell to pieces immediately on being exposed to the air.

England. Further Discoveries at Silchester.—The explorations at Silchester were continued during the season of 1896-97, in the course of which had been already excavated. One of them, like several others, appeared to have been given up for the dyeing industry. It contained two houses, one of large size, and four other blocks of buildings, as well as the remains of several hearths and furnaces; and it is conjectured that a large area toward the north was used as a bleaching ground. Two wells were discovered, one with a wooden framing at the top and bottom, and the other with a large wooden tub. Insula XVI contained a large house of the courtyard type in the northwest angle, and two other houses of the corridor type, besides an isolated square building. In one pit were found a large number of sheep's blades, the perforations in which showed that they had been used for rings and counters. Various other minor objects were found. A cutting about 6½ feet deep, outside the city and leading to the wall, afforded remains of iron collars at regular intervals, which were interpreted as showing that wooden pipes had been laid in the trench, the collars being used at the joints. A precisely similar discovery was made on the site of a Roman town at Châtelet, France, in 1772. The tracing of the pipe led to the discovery of a hitherto unknown gate in the city wall.

Greece. Temple of Artemis Agrotera.—In excavating on the left bank of the Ilissus, near Kallirhoe, M. Skias discovered about 100 steps from the spring the foundations of the "Luna temple of the Ilissus," which were seen and drawn by Stuart and Revett in the last century. The temple was afterward so completely destroyed that the present ruins could hardly have been regarded as the foundations of such a building but for the drawing of Stuart and Revett, with which they exactly correspond. Prof. Dörpfeld regards this as the temple of Artemis Agrotera, which Pausanias mentions as standing immediately at the crossing of the Ilissus, before the visitor turns toward the stadium.

The British School at Athens reported a satisfactory season, notwithstanding the war. The excavations on the supposed site of the gymnasium of Kynosarges in Athens had been carried to completion. The work had been continued at Melos, on the site of Phylakopi. There was now no doubt that the remains of an important prehistoric city had been discovered. Some good finds had been made at Patras, especially a statuette of Aphrodite of singular interest and beauty, which might safely be attributed to the third century B. C.

Palestine. A Map in Mosaic.—In the course of official inspection of a new map, discovered near the ruins of an old basilica at Madaba, in the city of Moslem Khasphas M. Khandy, the discovery of the

Greek Society of the Holy Sepulcher, discovered a mosaic which had apparently been 100 feet long and 66 feet wide, constituting a geographical chart of Syria, Palestine, and Egypt, of which parts of Palestine and Egypt remained. It appears to have formerly included also Asia Minor, for an old resident of Mesleba said that the names of Ephesus and Smyrna were still found several years ago in their proper situations. The date of the chart is assigned, from the character of the lettering and from the political divisions given and the absence of certain sacred places that should have been marked if it were of later composition, to between 350 and 450 A. D. The names of holy places are given only as to those for whose identity the authority of the Lord or of one of the prophets or of an early martyr can be cited. In addition to the old division, according to the twelve tribes, the plan of Palestine contains also the Roman division into a first, second, and third Palestine. The work is regarded as an important addition to our resources for Hebrew and Christian archaeology, history, and geography, in respect to which the author points out as among the advantages it offers that it makes us acquainted with a number of places hitherto not known; it gives to the Christian geographical identifications of that period; it designates exactly the cities and sites of the time; it is valuable for the identification of certain passages of Scripture, as, for example, the prophecies of Jacob concerning his sons Joseph and Benjamin; and it delineates exactly the shape, style, and foundation plan of the houses of the period. It is represented as marking "where there were plains and caves, deserts and oases, hills and mountains, rivers and creeks and woods, springs hot and cold, lakes and pools, boats and ships, palms and bananas; and these are all designated in their natural colors." The map appears to have been prepared with conscientious care, and is regarded as accurate.

Baalbec.—An appeal has been made by M. Casolani for the protection of the ruins of the temple of the Sun at Baalbec. It is believed that there were originally 58 columns. Of the 8 that remained in the latter part of the last century 6 are now standing, and some of them are rather dilapidated. The little that is left of the roof of the peristyle of the temple of Jupiter is also fast crumbling, two of the largest slabs that form it being in imminent danger of coming down.

Babylonia. Ruins of Nippur.—Reference was made in the "Annual Cyclopædia" for 1896 to some of the results of the excavations carried on by the expedition dispatched from the University of Pennsylvania at Niffer, the site of the ancient Nippur, on the Shat-en-Nil. More complete and definite accounts of these results have been published in books by Dr. J. P. Peters, the director of the first expedition, and in the editions of the cuneiform texts recovered, edited by Prof. Hilprecht. The central feature of the ruins at Niffer is the mound called by the Arabs Bint el Amir, "the Amir's daughter," which rises to about 100 feet above the surrounding plain. It marks the site of the great Ziggurat, or tower and temple which was built by Ur Gur or Ur Bahu, about 2800 B. C., and repaired and added to by later kings. Around this the explorations were conducted by Mr. Haynes, leader of the later expedition. A resemblance was noticed between the arrangement of this temple and tower and that of the early Egyptian pyramids and of the causeway connected with it and that between the temple of Khafra and the temple of the Sphinx; and a question is suggested as to which is earlier in origin. The tower was found to rest on a massive platform of crude brick, but beneath this was a second pavement of much finer construction, built of large

sun-dried bricks, nearly all of which were stamped with the names of Sargon I and Naram-Sin, his son, about 3800 B. C. These kings were both described as "builder of the temple of Mullil," which temple has been removed. Northwest of the temple the excavation of a line of mounds marking a rampart brought to light the remains of a solid brick wall, 52 feet thick and of unknown height, resting on a foundation of solid clay mixed with soil and puddled down—the work of Naram-Sin. A similar wall, of half the thickness of this one, was found at Tello by M. de Sarzec. Southeast of the great tower and close to the rampart was a chamber about 36 feet long and 12 feet wide, without a doorway and therefore supposed to have been entered from above, its floor resting upon the platform of Naram-Sin, which was built by Ur Gur. Beneath it was another chamber similar to it, the relics in which showed it to be the temple-archive chamber of Sargon. It had been partly restored by Ur Gur, who had also erected the upper chamber for his own archives. This chamber had been rifled some time between the reign of Ur Gur, 2800 B. C., and the rise of the Kassite dynasty, 2200 B. C., and the pillaging is supposed to have taken place during the Elamite invasion, 2285 B. C. The excavations were continued by Mr. Haynes to virgin soil, 30 feet farther down, through the *débris* of ruined buildings, accumulations of broken pottery, and fragments of inscribed stone objects and well-constructed drains. These remains proved the existence of at least two temples beneath the pavement of Naram-Sin. These strata had been disturbed and the buildings pillaged, but much remained to cast light upon earlier phases of Babylonian civilization than had been opened to us before. An altar of sun-dried brick, about 13 feet by 8, had a rim of bitumen around its upper course, and a large deposit of white ashes on its top. Around it was a low wall marking the sacred inclosure, and outside of this were two large vases of terra cotta, decorated with rope pattern. Southeast of the altar was a brick platform, about 23 feet square and 11½ feet high, built of fine unbaked bricks, round the base of which were water vents, leading to a drain passing underneath the platform, in the roof of which was the earliest known keystone arch.

More than 26,000 tablets and numerous inscribed fragments of vases and *stelæ* were received from this site, a considerable number of them of the period previous to Sargon. Among them were broken vases and other objects, many of them of the most archaic type, that had been votive offerings to the shrine of Mullil from the earliest time. A stone boulder, inscribed with a lineal inscription of a king named Lugal Kigub Nidudu, bore a second indorsement by Sargon in arrow-headed characters. Among the broken fragments were pieces of more than a hundred vases dedicated to the temple by a king named Lugal-Zaggesi, from which Prof. Hilprecht has constructed a complete text of 120 lines. Fragments of similar verses were found beneath the Sargonic pavement. When examined along with the earliest monuments from Tello the inscriptions were found to form a complete historical series relating to affairs of which no mention is found in the annals of Sargon or after. They relate to a series of primitive wars, and form certainly, whatever their age may be, the earliest historical record known. The earliest of them is the inscription, written in most archaic character, of Eshagsagana, who is styled "Lord of Kengi," or Lower Babylonia, "the land of channels and reeds." It describes a war against the city of Kish, the modern El Hymer, whose priest ruler had entered into alliance with tribes called "the hosts of the Land of the Bow," and describes how

the Babylonians "conquered the King of Kish and his ally," the evil-hearted "horde of the Land of the Bow," spoiled his city and burned his property, carrying away the statue of the king, his bright silver, and his furniture which he dedicated to Mul-lil. The next inscription in the sequence records the conquest of Babylonia by the king of the "hordes of the Bow." It shows that the victor had established himself in the ancient capital of Eresh, and that he ruled in Ur-Larsa as well, describing his empire as extending from the Lower Sea of the Tigris and Euphrates to the Upper Sea (Mediterranean), and asserting "dominion over all lands from the rising to the setting of the sun, whom he has caused to dwell in peace." This foreign dynasty was followed by one whose capital was Ur or Mughier. The identification of the people of the "Land of the Bow" has not been determined. Although Prof. Hilprecht's estimate that these relics date from a period three or four thousand years earlier than the time of Sargon is regarded by many scholars as exaggerated, no doubt is entertained that they are of much higher antiquity than any Babylonian records previously recovered.

Egypt. Tombs of an Early Dynasty.—The earliest remains yet found in Egypt have been discovered by M. Jacques de Morgan, Director General of Antiquities, in the region of Abydos, the capital of the first dynasty. In the course of the excavation flint arrowheads of extremely ancient pattern, sickles, saws, and figures of fishes, birds, and insects in slate were found. In a mound of peculiar shape not far from Negada the excavators came upon a tomb, whence passages led, with rows of columns, their walls covered with antique hieroglyphic inscriptions and bas-reliefs. Twenty-one rooms were opened, each containing a sarcophagus, of which the largest and central room had one larger than the others, resting upon a pedestal of solid rock. Around it were forms of fishes and dogs crudely carved in ivory; near the feet were the remains apparently of a lion, composed of pieces of ivory; and at its head and facing it was a life-sized figure of a man carved in wood. The sides of the room were covered with inscriptions of so remote a date that they could not be interpreted. Within the sarcophagus was a mummy case covered with hieroglyphics. The ceilings of the passageways were lined with bricks—probably sun-dried—of coarse workmanship, and the floors were of granite. The walls in many places were in so crumbled a condition that parts of the inscriptions were obliterated. Urns were found in all the rooms tightly closed and bearing on their tops the "banner name" or seal of the king. The royal names on the sarcophagi consisted of a few signs, not written in cartouches, but inscribed in squares similar to the banner names on the vases. The seals on the vases in the king's chamber were different from the usual Egyptian seals in being made from cylinders and not from scarabs. The chief sarcophagus, after having been opened, was closed and sealed for removal to Gizeh, where the body is to be unwrapped. The other sarcophagi are also to be taken to Gizeh and opened. The tomb is supposed to be of as early date as the first dynasty.

Sayings of Jesus.—A large store of papyri has been discovered by Messrs. B. P. Grenfell and A. S. Hunt in the ground at Behnesa. The find is described as appearing as if the shelves of a library had been emptied on the ground and then spaded over and lost to view. The papyri include contracts, wills, accounts, and other public and private documents, dating between the first and ninth centuries of the Christian era; portions of the works of Sophocles, Euripides, and Thucydides, and fragments of early copies of the New Testa-

ment in Greek. The document which has aroused the most interest is the one called the *Logia*, or sayings of Christ, a fragment 4½ by 3½ inches in diameter, and containing 24 sayings of Jesus, each beginning with the words "Jesus saith." The fragment is marked with the number 11, leaving it to be presumed that it is a part of a larger collection. The following is the Greek text of the *Logia*.

1. . . . και τότε διαβλέψας ἑββαλείν τὸ καρπὸν τὸ ἐν τῷ ὀφθαλμῷ τοῦ ἀδελφοῦ σου.
2. Λέγει Ἰησοῦς: "Ἐὰν μὴ ῥηστέωσθε τὸν αἵμα ἢ μὴ εὐφρανέσθε τὴν βασιλείαν τοῦ θεοῦ· καὶ ἔὰν μὴ οὕτως βασιλέα τὴν οὐρανὸν οὐκ ὀφείδετε τὸν Πατέρα."
3. Λέγει Ἰησοῦς: "Ἐστέ ἐν μέσῳ τοῦ κόσμου, καὶ ἐσχατὶ θεῶν αἰτέαί, καὶ εἴπω πάντας μαρτυρεῖται, καὶ οὐδὲν εἴπω ἐπὶ αὐτοῖς· καὶ παντὶ ὃ θυγὲρ μοι ἐπὶ τοῖς οὐκίς τῶν ἀδελφῶν ἐστὶ τυφλὰ εἶναι ἐν τῇ καρδίᾳ αὐτῶν."
4. [. . .] . . . [. . .] ἢ τοῦ σπυλαιῶ.
5. Λέγει Ἰησοῦς: "Ὅταν ἑὸς ἀνὴρ [καρ] διὰ καὶ τῷ [καρ] ἴσμεν μοῦσι, τῷ ἐνὶ εἰμὲ μετ' αὐτῶν. Ἐγὼ οὐκ τὸν ἀδελφόν, καὶ ἐπὶ εὐφρανέας μετ' αὐτοῦ τὸ εἶναι, καὶ ἐνὶ ἐμῇ εἰμῇ."
6. Λέγει Ἰησοῦς: "Οὐκ ἔστιν θεσπὶς προφήτης ἐν τῇ πατρίδι αὐτοῦ, οὐδὲ ἰσχυρὸς τοῖς θεσπισταῖς ἐν ταῖς γαμίαις αὐτοῦ."
7. Λέγει Ἰησοῦς: Πόλλος ἀποδοκιμασθεὶς ἐν ἑαυρὶ ἰσχυρὸς ὑψηλὸς καὶ ἰσχυρογυνῆς, οὐκ οὐκίς δύναται οὐκ ἐν ὁρῇ."

The eighth saying is illegible.

These lines have been translated to read:

- "1. And then shalt thou see clearly to cast out the mote that is in thy brother's eye."
- "2. Jesus saith, Except ye fast to the world, ye shall in no wise find the kingdom of God, and except ye keep the Sabbath, ye shall not see the Father."
- "3. Jesus saith, I stood in the midst of the world, and in the flesh was I one of them, and I found all men drunken, and none found I athirst among them, and my soul grieveth over the souls of men, because they are blind in their heart. . . ."
- "4. . . . Poverty."
- "5. Jesus saith, Wherever there are . . . and there is one . . . alone I am with him. Raise the stone and there thou shalt find me, cleave the wood and there am I."
- "6. Jesus saith, A prophet is not acceptable in his own country, neither doth a physician work cures upon them that know him."
- "7. Jesus saith, A city built upon the top of a high hill, and stablished, can neither fall nor be hid."

A Depository of Hebrew Manuscripts.—The *genizah*, or treasure house, of an ancient synagogue in Cairo, as described by Dr. S. Schlechter, is a room at the end of the gallery, without doors or windows, and entered through a hole reached by a ladder. In it were deposited, in obedience to the injunction that none of the sacred books should be destroyed, not only castaway copies of those works, but also in the course of time Hebrew writings of many kinds. The collection made by Dr. Schlechter from one of these depositories and presented to the University of Cambridge embraces numerous copies of the Old Testament and parts and of liturgies, going as far back as the fourth century. These fragments, though they offer no textual variations of importance, are of interest from the marginal glosses or Chaldaic and Arabic versions they contain, and on account of specimens of old forms of writing and punctuation, differing from both the Eastern and Western styles. Next to these

are fragments of the Babylonian and Jerusalem Talmud, which are of great importance as furnishing a new class of manuscripts and restoring parts of old rabbinic works long ago given up as lost. Haggadic legends and Talmud are accompanied by numerous commentaries and subcommentaries in Hebrew and Aramaic. Further are large quantities of autograph documents, dated from the eighth to the fourteenth centuries, with hymns, legal papers, letters, prescriptions, and fragments of miscellaneous works.

A Scepter of the Eighteenth Dynasty.—A colossal scepter, recovered by Prof. Petrie from the remains of a temple of Set at Nubt, near Nagada, has been presented to the British Museum. It was broken into many pieces, which were thought at first to belong to different objects, but were afterward found to form parts of a whole. Several pieces are still missing, but the general structure of the object is clearly defined. The shaft is 5 feet high and 6 inches in diameter, with the upper part curved and terminating in a head which is supposed to be of Set, and which, being 2 feet long, gives a total height of 7 feet. The shaft is inscribed in fine characters, with cartouches of Amenhotep II, of the eighteenth dynasty—all burned in dark glaze into the white, sandy grit of the paste of which the object is composed, and fired with a rich blue glaze. An important part of the inscription was found to be in a private collection, and has been presented to the museum to accompany the rest.

Antiquities of El Kab.—Writing of his last season's work at El Kab, in which he was assisted by Mr. Quibell, Mr. Somers Clarke observes that while it is no doubt true, that so far as we can tell by inscriptions the tomb of Sebeknekt is the oldest of the rock tombs there, it is hardly probable that there may not have been others older than it. Buried beneath the slope of sand that lies against the north side of the great wall were found several *mastabas* of brick with paneled sides; bowls of diorite—two bearing the name of Seneferu—were with other things in the wells. Staircase tombs were also found similar to those at Nagada, a number of Libyan burials, also a cemetery of the twelfth dynasty, part of it outside the great wall and part within. The remains of *mastabas* similar to those found outside and of the same period were found inside the inclosure. The wall was evidently built regardless of the ancient sanctuaries. The date of the great wall has not been determined. While the inscriptions in the immediate neighborhood had already demonstrated the importance of El Kab in the sixth dynasty, the researches have now carried it back to the fourth dynasty, when, judging by the importance of the tombs, it must have been a place of no little consequence.

Stone Implements from Egypt and Somaliland.—A collection of prehistoric flint implements discovered in Egypt by Mr. H. W. Seton Karr in November, 1896, was exhibited in June at the rooms of the Archaeological Institute. The mines are situated in the Wady-el-Sheik district, in the eastern desert of Egypt, about 30 miles distant from the Nile. Many of the types of implements are new to science. Only two palæolithic implements of the earliest date were found in this region. Others included in the exhibition came from Abydos, Nagada, Nagh Hamdi, Thebes, and other places in the western desert. At some of the mines are shafts about two feet in diameter, filled up with drifted sand, and surrounded by masses of excavated rock neatly arranged. There was usually a central work place where most of the objects were discovered. In some mines a number of clubs or truncheons lay distributed uniformly as though hurriedly

left when the quarries were abandoned. Other implements—of flint and quartzite—are from Somaliland. They were found on a long low hill about 100 miles from the coast. The country around was of limestone, in some places overflowed by lava, and the implements lay in ones, twos, and threes. Sir John Evans wrote to the Royal Society that these discoveries "have an important bearing on the question of the original home of the human race. Of their identity in form with some from the valley of the Somme and other places there can be no doubt, and we need not hesitate in claiming them as palæolithic."

The question of the origin of the Egyptian race is discussed by M. le Vicomte J. de Rouge in the "Bulletin et Memoirs de la Société des Antiquaires de France." Three theories have been suggested on the subject: 1, That the Egyptians came from Asia through the isthmus of Suez; 2, that they came, partly from Asia, through Ethiopia; and 3, that the majority of them originated in Africa and passed into Egypt by the west and southwest. M. de Rouge cites reasons, based on the later excavations in Babylonia and the comparison of the remains of the earliest known Egyptian art with the probably still earlier remains recently found there, for believing that Egyptian civilization was derived directly from Babylonia.

Historical Value of Mr. Petrie's Discoveries.—Prof. Petrie spoke at the annual meeting of the Egypt Exploration Fund, Nov. 10, of the results of his labors among tombs of the fifth dynasty at Deshasheh as being of the greatest interest for the early history of Egypt. From the mass of bones he had now collected they had, for the first time, an insight into the great question of the populations of the country. They could now definitely say that there was no clear change during three or four thousand years, and that a distance of 50 miles made more difference in the type than a lapse of four thousand years in one place. They had the fortune to find a group of statues of the fifth dynasty, and to bring to England one of the two best, which was far the finest piece of Egyptian statuary that had ever reached that country.

Algeria. Mussulman Ruins of Kalaa.—M. Blanchet, working under the Archaeological Society of Constantine, Algeria, reports the discovery of the Mussulman city which was in the eleventh century the capital of northern Africa—the Kalaa of Beni Hammad. This city, which once had 80,000 inhabitants, is now covered with grain fields, and to reach it the traveler has to ride seven hours among the mountains. Many archaeologists have passed within a few miles of it without suspecting its existence. M. Blanchet has exhumed on the site a mosque of about 200 by 180 feet dimensions, covered with green emeralds and sustained by columns of rose marble; a palace; a public fountain; a castle imposingly situated on the top of a rock and flanked by towers, the least ruined of which was about 45 feet high. The discovery derives additional interest from the fact that no Mussulman ruin of the epoch of this one was known to exist in Algeria. The monuments of Tlemcen were built in the twelfth century; those of Kalaa date from 1007. A new chapter in the history of art has thus been revealed to us.

India. Ruins of Dimāpūt.—The ruins of Dimāpūt in Assam consist of a number of tanks, large quantities of broken pottery, and a number of carved speckled gray sandstones, inclosed in an area about a mile square by a brick wall of later building, with a moat and a gate. Dimāpūt was sacked by the Ahōms in 1535, and has been uninhabited since, while a dense jungle has grown up all over the upper valley of the Dhunsiri. The

stones are carved with geometrical designs, figures of animals, conventionalized lotus flowers, and trees. They are of two kinds—round, free-standing, with expanded mushroomlike tops, and narrow necks, gradually widening again to their bases; and others Y-shaped, the stem of the Y forming the base, while the free ends of the limbs have mortises. The moldings of both these kinds suggest a wooden origin. At present three groups of these stones have been found, with two solitary stones. Their orientation approaches north and south. They are arranged in rows, in one group a double row of round stones, each pair of which apparently stood due east of a double row of Y-shaped stones; in a second group a row of round stones; and in the third group a row of stones shaped like a U, to the east and west of each pair of which stood a pair of round stones. In the first group are the remains more or less complete of 64 stones; in the second group of only a few; and in the third group of 20 or 30 at least. While the round stones were evidently free-standing, the others bore in their mortises crowning ornaments of some kind, all traces of which have been lost. The vagueness of the symbolism employed precludes at present a definite attribution of the works to any particular religion. Local tradition refers them to rites of human sacrifice.

In the Lake of Nemi, about 17 miles southeast of Rome, where the Emperor Tiberius had a pleasure house, with two triremes on the waters, there have recently been discovered several massive mooring rings and tops of stakes by which the vessels could be moored to the quay. The rings are fixed in the mouths of bronze heads of lions, wolves, and Meduse, by the teeth of which they are retained in their proper places. The heads are modeled with great accuracy and skill, and the faces are lifelike in similarity to the animals represented. Notwithstanding their long immersion, they are all perfectly preserved.

ARGENTINE REPUBLIC. a federal republic in South America. The legislative power is vested in a Congress, consisting of a Senate and a House of Representatives. There are 30 Senators, 2 for each province and 2 for the capital, and 86 Representatives, 1 to every 20,000 inhabitants. The President and Vice-President are elected for six years. One third of the Senate is renewed every two years, and one half of the House of Representatives at the same time. José E. Urriburu, the Vice-President, became acting President for the term ending Oct. 12, 1898, when Dr. Saenz Peña, on Jan. 22, 1895, resigned the presidency. The Cabinet officers at the beginning of 1897 were: Interior, Dr. B. Zorilla; Foreign Affairs, Dr. Amancio Alcorta; Finance, Dr. J. J. Romero; Justice, Worship, and Public Instruction, Dr. A. Bermejo; Army and Marine, Gen. Villanueva.

Area and Population.—The estimated area and population of the capital and of the provinces and national territory, according to the census of May 10, 1895, are given in the table in the next column. Including 60,000 persons omitted, 30,000 Indians, and 50,000 Argentines abroad, the total is 4,082,000. The population has increased since 1869 at the average rate of 4.6 per cent. per annum. The city of Buenos Ayres in June, 1896, had a population of 690,788, of whom 345,500 were foreigners. The next largest town, Rosario, had 93,584 inhabitants in 1895. From 1873 to 1893, inclusive, 1,683,000 persons arrived from foreign countries and 567,000 departed, making the net immigration 1,116,000. The number of immigrants in 1894 was 54,720; in 1895, 46,783. The bulk of the immigrations is from Italy. In 1894 the Italian immigrants numbered 37,699; Spaniards, 8,122; French, 2,107; Germans,

971; Russians, 3,132; Austrians, 440; Russian Jews, 2,860. The departures in 1894 numbered 41,359. The number of foreigners in the republic in 1895 was estimated at 1,000,000, compared with 600,000 in 1887, when there were 280,000 Italians, 150,000 French, 100,000 Spaniards, 40,000 British, and 20,000 Germans. About two thirds of the foreign population are males. Among the native Argentines the females are in excess. The Jewish Colonization Association acquired 320,000 acres of agricultural lands in Buenos Ayres, Entre Rios, and Santa Fe, of which 180,000 acres are occupied by Jewish settlers from Russia and other European countries. Elementary education is secular, gratuitous, and compulsory. In 1890 the amount raised by school taxes, with the Federal contribution, amounted to \$10,415,780 in Argentine currency. There were 2,744 public schools in 1895. There is a lyceum in each province under the direction of the Federal authorities, and universities are established at Cordoba and Buenos Ayres.

PROVINCES, ETC.	Area in acres.	Population.
City of Buenos Ayres	115	693,854
Provinces:		
Buenos Ayres	63,000	1,071,225
Santa Fe	14,000	297,280
Entre Rios	45,000	250,004
Corrientes	54,000	229,529
Rioja	21,500	60,228
Catamarca	31,500	100,107
San Juan	28,700	84,251
Mendoza	54,000	119,086
Cordoba	54,000	321,745
San Luis	18,000	81,106
Santiago del Estero	21,500	100,445
Tucuman	18,500	215,000
Salta	45,000	119,138
Jujuy	27,000	69,543
Territories:		
Misiones	23,900	33,005
Formosa	73,000	4,929
Chaco	85,000	10,280
Pampa	91,000	25,765
Rio Negro	124,000	9,300
Neuquen	57,000	14,517
Chubut	154,000	1,706
Santa Cruz	182,500	1,058
Tierra del Fuego	13,000	677
Total	1,778,105	3,562,360

Finances.—The revenue for 1895 was \$29,805,651 in gold and \$28,958,400 in paper, compared with \$27,790,500 in gold and \$24,861,412 in paper in 1894. The expenditure in 1895 was \$24,165,239 in gold and \$81,923,387 in paper. For 1896 it was estimated that the expenditure would be \$15,811,338 in gold and \$87,022,058 in paper. The actual expenditure was \$29,390,000 in gold and \$92,224,000 in paper, and the receipts were \$32,127,000 in gold and \$34,237,000 in paper. The budget for 1897 makes the gold revenue \$32,078,000, of which \$29,300,000 are derived from import and export duties, \$1,976,000 from post dues, \$280,000 from stamps, and \$622,000 from interest. The revenue in paper currency is estimated at \$63,700,000, of which railroads and public works produce \$4,500,000; land taxes, \$1,500,000; licenses, \$1,750,000; stamps, \$5,400,000; the post office, \$2,300,000; internal taxes, \$17,600,000; use of credit, \$25,000,000; and various resources, \$5,650,000. The expenditure for 1897 is estimated at \$16,303,955 in gold, viz., \$1,600,000 for the interior and Congress, \$366,880 for foreign affairs, and \$14,337,075 for the debt, and \$109,128,372 in paper, of which \$28,401,086 are required for the interior and Congress, \$625,448 for foreign affairs, \$7,515,495 for the Finance Department, \$10,323,034 for the debt, \$14,057,444 for the Ministry of Justice and Instruction, \$19,634,978 for the Army Department, \$10,560,917 for the navy, and \$18,000,000 for extraordinary expenditures of the Department of War and Marine.

The estimated expenditure of all the provinces for 1894 was \$20,512,519. The revenue of the province of Buenos Ayres in 1895 was \$13,125,607, and the expenditure \$12,881,551. The total amount of the provincial debts in 1895 was \$137,261,866 in gold, including arrears of interest. The aggregate debt of the municipalities is \$24,596,422. In 1896 Congress passed an act for the unification of the national and provincial external debts. The settlement of the railroad guarantees was also approved, and bonds were issued and accepted by the companies in satisfaction of all claims against the Government, excepting two companies that refused to agree to the arrangement.

The debts of the Federal Government at the beginning of 1896 amounted to £78,483,515 sterling, consisting of £55,519,123 of external loans, an internal debt of \$91,883,031 in gold, equal to £18,230,700, and one of \$83,502,338 in paper, equal to £4,733,692. This does not include floating liabilities, reported to amount to \$1,370,000 in gold and \$9,020,000 in paper on Dec. 31, 1895. The debt charge for the fiscal year 1895 was \$13,846,322 in paper and \$1,478,311 in gold. The state debts amount to \$28,000,000.

The new national bank, opened on Dec. 1, 1891, after the old one went into liquidation, has 62 branches, with a total invested capital of \$51,987,366 of paper and \$58,961 of gold on April 1, 1895. Its note circulation on Aug. 31, 1896, amounted to \$46,000,000, the guaranteed notes of the national banks to \$117,046,150, those of the Central National Bank in liquidation to \$90,019,533, those of the Banco Hipotecario to \$30,000,000, and those of smaller institutions and of the municipality of Buenos Ayres brought the total of the paper currency in circulation up to \$296,737,023, according to the report of the Caja de Conversion. The amount of notes redeemed in the year 1894 was \$8,000,394.

The Army and Navy.—The regular army consisted of 1,659 officers and 10,404 men in 1895. The Government proposed in 1896 to bring the effective up to 15,302 men. The National Guard has about 480,000 men enrolled. The younger members receive a brief military training, being called into camp when first inscribed, at the age of twenty, and drilled for sixty days. The rest of the National Guard is drilled on Sundays for two months of each year.

The navy is one of the strongest in South America. The English-built armored cruiser "Almirante Brown," of 4,300 tons, protected by 9-inch steel-faced armor, carried 8 12-ton Armstrong guns. The first-class cruisers "San Martin" and "Varela" were purchased from Italy. The "Nueve de Julio," a cruiser of 3,575 tons displacement, armed with 4 6-inch and 8 4.7-inch quick-firing guns and 24 Hotchkiss guns, has made 21.9 knots with natural draught. The ram cruisers "Libertad" and "Independencia," launched in England in 1890 and 1891, are powerfully armed and well protected for their size—2,500 tons—each carrying 2 9½-inch Krupps, mounted to fire at an angle of 40°, and 4 4.7-inch quick-firing Armstrongs and having 8-inch plates on the sides and on the barbettes. The powerfully armed torpedo gunboat "Patria," built to replace the lost "Rosales," has made 20.5 knots with forced draught. The smaller "Aurora" has a speed of 18.5 knots. The new protected cruiser "Buenos Aires," of 4,500 tons displacement and 14,000 horse power, made the extraordinary speed at her trial of 23.2 knots. Her armament consists of 2 8-inch, 4 6-inch, 6 4.7-inch, 16 3-pounders and 8 1-pounder guns. The "25 de Mayo" is a powerful second-class cruiser. Of third-class cruisers there are 6, and the torpedo fleet consists of 10 first-class and 4 third-class boats. Four destroyers

designed for a speed of 26 knots are being built in England. Two old monitors serve for harbor defense.

Commerce and Production.—The imports of merchandise in 1895 amounted to \$94,856,000 and the exports to \$118,937,000, gold value. The values of the various classes of imports were: Textiles and wearing apparel, \$37,304,411; articles of food, \$11,543,370; iron and manufactures thereof, \$9,800,565; beverages, \$8,798,254; timber and manufactures of wood, \$3,812,243; railroad material, etc., \$1,922,179; paper and paper manufactures, \$2,236,949; various metals, \$1,430,009; pottery and glass, \$2,256,423; chemicals, \$4,830,067; coal and oil, \$6,306,834; miscellaneous, \$2,158,574. Of the total exports \$74,029,876 were animals and animal produce, \$39,100,000 agricultural produce, \$2,348,012 manufactures, \$338,982 mineral products, and \$358,554 miscellaneous products. The quantity of wool exported was 201,353 tons, having increased in two years from 123,230 tons; of sheepskins, 33,664 tons, compared with 25,569 tons in 1893; of wheat, 1,010,269 tons; of corn, 772,318 tons, against 54,876 tons in the preceding year; of meat, 99,757 tons, increasing from 68,371 tons in 1893 and 80,000 tons in 1894.

The imports of coin and bullion in 1895 were \$4,723,333; exports, \$118,275. In 1896 the imports of specie were \$6,000,000 and the exports \$2,000,000. The average rate of exchange was 296, against 343 in 1895. The total gold value of imports in 1896 was \$112,000,000, and of exports \$116,000,000.

The value of the commerce with each of the principal foreign countries in 1894 is shown in the following table:

COUNTRIES.	Imports.	Exports.
Great Britain.....	\$39,524,270	\$14,694,733
France.....	9,116,870	20,357,169
Germany.....	11,162,549	13,323,324
Belgium.....	7,441,356	15,417,711
United States.....	6,686,999	8,947,165
Italy.....	10,393,129	3,518,087
Brazil.....	4,095,665	8,096,105

Only 15,000,000 acres out of 240,000,000 acres of cultivable land was actually under cultivation in 1895. There were 5,500,000 acres under wheat, yielding 1,400,000 tons in 1896. Corn is grown extensively, and a considerable area is devoted to raising flax. The sugar plantations cover 82,000 acres in the north, yielding 120,000 tons in 1896. The area of vineyards was 71,135 acres in 1895, when the wine crop was 42,267,200 gallons. There were 4,447,000 horses, 21,702,000 cattle, 74,380,000 sheep, and 3,885,000 goats and other animals in 1895. The number of cattle slaughtered in 1895 was 1,954,800, and in 1896 there were 1,204,288 slaughtered from the pampas of the Argentine Republic, Uruguay, and the southern province of Brazil. The Argentine *saladeros* slaughtered 733,660 head in 1895 and 367,230 head in 1896.

Navigation.—During 1895 there were 6,496 steamers, of 5,461,468 tons, and 3,382 sailing vessels, of 785,633 tons, entered from foreign ports. About 86 per cent. of the import trade and 51 per cent. of the export trade passes through the port at Buenos Ayres. The mercantile navy of the republic in 1895 comprised 75 steamers, of 21,613 tons capacity, and 125 sailing vessels, of 28,241 tons.

Communications.—The length of railroads in operation in 1895 was 8,766 miles. The capital expenditure up to 1896 was \$466,016,879. The gross earnings in 1895 were \$26,394,306, and expenses \$13,846,464. Of the total capital outlay, \$42,426,297 were expended by the Federal Government on the Government lines, \$111,393,069 by companies on guaranteed lines, \$229,159,165 by companies

without guarantees, and \$83,038,348 on provincial lines.

The telegraphs have a length of 30,415 miles. The post office forwarded 142,436,240 internal and 22,906,267 international letters and packets in 1895. There was earned a net revenue of \$3,595,125.

Politics and Legislation.—Financial questions continued in 1897 to occupy the attention of Argentine legislative bodies. The Senate in January adopted a scheme for the issue of \$10,000,000 of new cedulas for the purpose of advancing loans for the promotion of agriculture. The municipality of Buenos Ayres was authorized to raise a loan of \$5,000,000.

Gold in the beginning of February rose to a premium of 201, when the Government took steps to check the rise. German holders of Argentine obligations negotiated a settlement with the Government. The United States minister protested against a discriminating overcharge made by the River Plate Telegraph Company, an English corporation, in connection with the Western and Brazilian Telegraph Company, also English, on American messages; whereupon the Argentine Government compelled the company to take messages at the published rates under threat of closing their office. The railroad companies, which have hitherto collected the prices of telegraph messages in gold, were ordered in June to transmit messages over their telegraph lines at the same currency rates as prevail over the national lines. A new system of docks, including two dry docks, was inaugurated with public ceremony on June 24 in Buenos Ayres. These docks have been ten years in progress, and cost \$35,000,000.

The Argentine minister at Santiago entered into fresh negotiations with the Chilean Government for the determination of the boundary line over the Andes. The chief difficulty lay in the disputed surveys at Puna Atama and through Patagonia. In case of final disagreement the line will be fixed, according to treaty, by the arbitration of the Queen of England. Criticisms in official quarters on the administration of the army led the Minister of War and the chief of the general staff in February to offer their resignations, which, after a public vindication, they were induced to recall. In May, unemployed laborers committed riotous acts in San Luis provinces, and were dispersed by Federal troops.

The Argentine Congress began the session of 1897 on May 7. In his message President Uriburu dwelt on the proposed modifications in the United States tariff, and threatened retaliation against the high duties placed on the leading products of the Argentine Republic, but he hoped the interests of the two countries would render extreme measures of retaliation unnecessary. In consequence of the duties imposed by the United States Government on hides, wool, and other Argentine products, a bill was framed in October embodying a retaliatory tariff, affecting particularly petroleum, white-pine and spruce lumber, and agricultural implements and machinery. On the subject of the debt the President said in his message that the Government would give effect to the law for promoting full payment of its external obligations, and would meet the extraordinary expenditure for armaments without resorting to new issues or loans. Attention was called to the necessity of commencing the redemption of the paper money and forming a cash reserve.

Locusts caused a failure of the wheat crop. The exports of this cereal for the first three months of 1897 were little more than a fifth of the quantity shipped during the corresponding months in 1896. In some provinces the harvest was so poor that the Government distributed seed wheat to colonists.

Congress was asked to appropriate \$1,000,000 for the purpose of destroying the swarms of locusts. The English Government bought a large number of horses for its cavalry in the Argentine Republic, and shipped many of them to South Africa.

The Minister of Finance had a plan for consolidating the provincial debts, which he thought could be settled for \$80,000,000 in gold, but his colleagues disapproved of assuming so heavy a burden. The National Government made an arrangement to assume the external debt of the province of Buenos Ayres, giving the provincial creditors \$34,000,000 in 4-per-cent. gold bonds. The provincial government agreed to pay the sums required for the service of the bonds to the National Government from the proceeds of the ordinary revenue. The receipts of the port of La Plata were pledged as a guarantee. The English creditors hesitated to accept the settlement offered, but the Minister of Finance informed them that the province could not pay more. Congress was asked to establish a tobacco monopoly, the proceeds to be applied toward paying the foreign debt. There was a deficit of \$70,000,000, of which \$50,000,000 was brought down from former years, and \$20,000,000 was the shortage of 1897. These floating liabilities, consisting of guarantees and other obligations at home and abroad, caused great difficulty in the preparation of the budget, and the Government sought to discover a way of covering the deficit by a financial operation. The tobacco monopoly was expected to yield a revenue of \$12,000,000. The National party, which controls a majority of the voters, held its convention on July 10, with Dr. Pelligrini in the chair, and nominated Gen. Roca for President without opposition. Dr. Quirno Costa was named as the candidate for Vice-President. He resigned his portfolio as Minister of the Interior on July 14 on account of the nomination, and Dr. Bernejo at the same time resigned his as Minister of Justice in order to oppose the election of Gen. Roca as President. There is a strong disposition on the part of the provinces to assert their power over the capital, in which a very large proportion of the total wealth of the country is concentrated, and Gen. Roca is a champion of this sentiment. The platform of the country party, besides putting to the fore the provincial economic interests, favors the introduction of foreign capital, greater stability of the currency, and more attention to credit abroad. The budget for 1898 proposed economies that Congress would not accept, and new taxes and monopolies of tobacco and alcohol that were exceedingly unpopular.

ARIZONA, a Territory of the United States, organized Feb. 14, 1863; area, 113,020 square miles. The population, according to each decennial census, was 9,658 in 1870; 40,440 in 1880; 59,620 in 1890; and estimated at 101,000 in 1897. Capital, Phoenix.

Government.—The following were the Territorial officers during the year: Governor, Myron H. McCord, appointed in May to succeed Benjamin J. Franklin; Secretary, Charles H. Akers, appointed in May to succeed C. M. Bruce; Treasurer, F. E. Farish; Auditor, C. P. Leitch; Adjutant General, Edward Schwartz; Attorney-General, J. W. Wilson; Superintendent of Instruction, T. E. Dalton; Chief Justice of the Supreme Court, Albert C. Baker; Associate Justices, John J. Hawkins, Owen T. Rouse, and James D. Bethune; Clerk, Joseph L. Alexander—all Democrats.

Finances.—The bonded debt of Arizona is \$739,100; the floating debt, \$237,115; the actual debt, exclusive of interest on outstanding warrants, \$548,947. There were funded into Territorial bonds for account of Pima County, \$210,240.00; Mohave County, \$105,363.29; Yuma County, \$88,791.11; Maricopa County, \$267,636.43; Pinal County, \$136,138.08;

Yavapai County, \$52,163.78; Apache County, \$43,429.86; Coconino County, \$159,000.99; Graham County, \$147,291.70; Gila County, \$44,781.66; making a total for all counties, \$1,254,959.95. On account of small quantities of property assessed, \$90,167.24; Tucson, \$16,000; Tombstone, \$12,812.68; total, \$119,979.62. The total liability on account of counties and municipalities is \$1,374,899.57. The Auditor's report showed the total expenses of Territorial government for 1896, \$441,705, a reduction of \$3,000 over the previous year.

Valuations.—The following figures show the present valuation of taxable property, as reported by the Territorial Board of Equalization: Land, \$3,593,777.10; improvements, \$1,393,285.78; town and city lots, \$4,514,069; improvements on same, \$7,289,880.05; horses, \$754,542; mules, \$31,476; asses, \$1,180.50; cattle, \$3,413,001.20; sheep, \$461,785; goats, \$12,629; swine, \$29,160; railroads, \$5,337,082.25; all other property, \$4,212,514.52; total, \$28,017,176.40—over \$500,000 increase on the preceding year. The Governor said in his message to the Legislature that he considered the report of the Board of Equalization as representing only about one third the actual property value of the Territory, and recommended that corporations be compelled to make proper returns; also that a more exact and equitable system of taxation be adopted.

A report of valuations in the capital county of the Territory showed: Lands, 259,847 acres, value \$3,129,351, value of improvements \$300,515, total value \$3,429,866; town and city lots, value \$2,354,227, improvements \$1,117,910, total \$3,472,137; horses, 3,970 head, \$80,966; mules, 198 head, \$3,683; asses, 15 head, \$110; cattle, 18,528 head, \$177,943; sheep, 49,713 head, \$74,701; goats, 257 head, \$310; swine, 8,002 head, \$12,178; all other property, \$1,186,181; railroads, 94.59 miles, \$463,940.17. Total value of all property in Maricopa County, \$8,901,015.17.

Education.—The school census showed 16,936 children of school age for 1896, an increase of 1,027 over the previous year. Seventy-six per cent. of these were enrolled in the public schools. The number of school districts in the Territory is 223, and there are 293 grammar and primary schools. Average teachers' salaries are \$72.90 per month for males, and \$66.26 for females. Total school expenditures for the year were \$214,450.88. In May the citizens of Phoenix voted \$30,000 of bonds for additional school facilities. The sum of \$33,264 has been expended on the reform-school building, not yet finished.

Territorial Prison.—The superintendent reported that up to January, 1897, 233 prisoners had been received and 184 discharged. The gross expenses of 1896 amounted to \$33,731.82, and the gross receipts to \$33,080.82, leaving a net per diem cost of \$92.29, and a net per capita per diem cost of \$4.76. Contribution on the net per diem cost of \$15.17, and of the net per capita per diem cost of \$152. The total value of the prison property is estimated at \$148,969. The prison has a library of over 2,000 volumes. The library is maintained by charging visitors to the prison a fee of 25 cents.

Irrigation.—The effort to secure water by artesian wells in some of the valleys of the Territory is proving highly successful. About 20 flowing wells have been developed between Fairbank and Benson, in the San Pedro valley. The last well bored gave water at a depth of 140 feet, and a large volume has been flowing steadily.

Agriculture.—It has been suggested that Arizona ought to be a good region for the raising of cotton, and the "Phoenix Herald" has the following to-day on the subject: "Cotton-growing is not unknown in the Salt River valley. In 1883 most

successful crops of cotton were grown in this valley, and a huge bale of it, 400 pounds, was on exhibition at the New Orleans Exposition, and it was pronounced by experts to be of the finest, the fiber being equal to the famed sea island cotton. This bale was part of a crop of ten acres which yielded not only a splendid fiber but an enormous crop. The principal trouble with the business was that, owing to the cost of labor here and railroad tariffs, cotton-growers could not compete with States farther east that had water transportation and cheap and abundant labor; and that is principally the difficulty that remains to-day to prevent the growing of cotton in central Arizona. There is no question as to the facility with which it can be raised, the fine, long fiber it will produce, or the great quantity it will produce per acre."

The experiment station of the Territory was supplied with German sugar-beet seed for distribution, and all residents were duly notified that seed might be secured upon request. Tobacco has been grown in considerable quantities along the Killito, in Pima County, and experiments are being made with it in other sections. Australian salt-bush has been grown upon the experiment station grounds at Tucson without water for over two years. The location of the plants is upon the mesa north of the city, where it is exceedingly dry. This is held to indicate that this forage plant is valuable for arid regions. The station at Tucson has distributed seed gratis throughout the Territory for the purpose of having the plant thoroughly tested. The director of the Tucson Experiment Station announced that he had received offers from foreign capitalists to enter into contracts for ramie fiber in the rough at from \$40 to \$50 a ton, and stated that from results obtained in experimenting with ramie it might be grown with ease in the Territory and ought to prove a paying crop. The date industry is receiving much attention, and experiments have proved successful beyond question.

Distilling.—Distilling is carried on in Arizona at only 2 places—Mesa, Maricopa County, and Pima, Graham County. At the former is a grape distillery and at the latter one fruit and one grain distillery. Distilling in Maricopa is carried on mainly for the purpose of supplying brandy for the fortification of sweet wines, the county having produced 13,000 gallons of such wine in 1896. Except brandy used for this purpose only 37 gallons were reported. Brandy used in the making of wine is by law exempt from the 90-cent tax.

Mining.—Arizona is reported as rapidly coming to the front as a great copper-producing region. With the completion of the Gila, Globe and Northern road to Globe the fourth great copper camp of the Territory will be opened and operated. Those already in operation—Bisbee, Clifton, and United Verde—are said to be immense producers, though none is being worked to its full capacity. At Lee's Ferry gold and silver are found associated with copper, the former showing good values. The White Hills camp, in Mohave County, is reported to have yielded about \$2,000,000 in gold and silver ores since its discovery, in 1892.

ARKANSAS, a Southern State, admitted to the Union June 15, 1836; area, 53,850 square miles. The population, according to each decennial census since admission, was 97,574 in 1840; 209,897 in 1850; 435,450 in 1860; 484,471 in 1870; 802,525 in 1880; and 1,128,179 in 1890. By estimates based on the school census of 1895 it was 1,248,056 in that year. Capital, Little Rock.

Government.—The following were the State officers during the year: Governor, Daniel W. Jones; Secretary of State, Alexander C. Hull; Treasurer, Ransom Gulley; Auditor, Clay Sloan; Attorney-

General, E. B. Kinsworthy; Superintendent of Education, Junius Jordan; State Land Commissioner, J. F. Ritchie; Commissioner of Agriculture, W. G. Vincenheller; Adjutant General, A. B. Grace; Chief Justice of the Supreme Court, Henry G. Bunn; Associate Justices, S. P. Hughes, C. D. Wood, B. B. Battle, J. E. Riddick. All are Democrats.

Finances.—The Treasurer's latest biennial report comes down to Oct. 1, 1896. Following is the summary: Cash in treasury Sept. 30, 1894, \$424,685.75; receipts to Jan. 17, 1895, inclusive (expiration of former Treasurer's term of office), \$40,679.24; payments, \$189,713.11; balance in treasury Jan. 18, 1895, \$275,651.88; receipts from that time to Sept. 30, 1896, \$1,946,779.90; payments, \$1,664,490.35; balance in the treasury Oct. 1, 1896, \$557,941.47.

In the case of the State against S. H. Buchanan, former Treasurer of the Board of Trustees of the State Insane Asylum, and his bondsmen, it is found that he gave no valid bond for his fifth term and part of the sixth, the time of the greater part of the shortage; so that judgment was rendered against him alone for \$11,617.48, the sureties being found responsible for only the remaining shortage of \$1,712.12, which was incurred during the fourth term.

The appropriation made by the Legislature for pensions to Confederate veterans enabled the board to pay 96 per cent. of the claims it had allowed.

Valuations.—The compilation of assessments shows the following values: Real estate—whole number of acres of land taxed, 21,738,267; total value of land, \$72,080,139; total value of city or town lots, \$30,679,058; total value of railroad tracks, etc., assessed by State board as real estate, \$14,402,053; total value of real estate, \$117,161,250. Persons and personal property—persons liable to pay a poll tax, 261,402; value of railroad property assessed by State board as rolling stock, \$6,409,562; total value of personal property, \$58,236,182; total value of real and personal property, \$175,397,432.

The assessed valuation of personal property for 1895 was \$54,652,706; realty, \$119,106,658.

The Land Commissioner reported that \$100,000 had been paid into the treasury from his office during the biennial period. About 800,000 acres of State lands are still left for disposal.

Education.—The school enumeration for 1895-'96 was 456,736, of whom 124,957 were colored. The total enrollment in the public schools was 296,575, and that in private and denominational schools 4,099. The whole number of teachers in public schools was 6,673. The value of school property amounts to \$1,929,206.40. The receipts were \$1,675,991.13, and the expenditures \$1,232,986.08.

Of the county normal schools the Superintendent says: "The Peabody appropriation has been spent in supplementing the appropriation by the Legislature for the establishment of the normal in each of the 75 counties of the State. In half of the counties the attendance was so encouraging that the sessions were extended five and six weeks. The result shows that we had 5,225 white teachers enrolled in the State, 5,148 were in attendance at the normals, and there are three counties to hold their normals in September and October. By Peabody aid I have increased the number of colored normals from 26 in 1896 to 33 in 1897, and there is a three-months' normal for the colored teachers of eastern Arkansas yet to be held.

The report of the State University shows the receipts for two years to have been \$201,976.39, and the expenditures \$168,765.07. The twenty-fifth graduating class in June numbered 14. The medical department graduated 25 in April.

Charities.—The appropriation for the Asylum for the Insane for the two years ending April 1, 1899, was \$184,400, which included \$8,000 for re-

pairs. The average number of patients is about 500. The report of an investigating committee of the Legislature was in general favorable, but said: "In regard to the mortality of said institution for the past two years, we find the death rate to be about 11 1/2 per cent. per annum, and from the average death rate from similar institutions in other States we find from expert testimony that it should not exceed 7 or 8 per cent. The cost of maintenance per capita in 1896 was about \$6.62 a month.

In the School for the Blind the average was \$12.47 per annum for traveling expenses, and \$58.51 per pupil while in school. The total enrollment was 172, and the actual attendance 145.

The Children's Home Society has placed about 165 children in homes during the two years of its existence.

The Penitentiary.—The value of the buildings, grounds, and camps is given at \$181,236.33. Of the 700 convicts, about 250 are under twenty years of age. The share-crop system of working the inmates has proved profitable, and a farm is to be bought by the State.

Insurance.—The Auditor's report gives the figures below for 1895-'96: The fire insurance companies have written risks in this term for \$66,704,316; collected premiums amounting to \$1,412,760; paid losses amounting to \$808,266. The life insurance companies have written in risks \$21,730,288; received premiums, \$1,597,800; paid losses of \$529,620. They have paid taxes and fees amounting to \$38,173.94, an increase of \$9,426.09 over the preceding two years.

Railways.—Steps have been taken toward the construction of a road to be made by convict labor and owned by the State, as provided for by the Legislature, running from the capital to the Missouri line; and others are proposed.

By a decision of the Supreme Court a railroad company was held not to be responsible as a common carrier for baggage which was burned at a station at 1 A. M. after having been left there two hours after the passenger's arrival; and he could recover damages only by showing such negligence as would make the company liable as a warehouseman.

Coal and Cotton.—The State produced in 1896 coal to the amount of 494,000 tons, and in 1897 the cotton crop was given at 700,000 bales.

Discoveries of Pearls.—Great excitement has been caused by the reported finding of fine pearls in great numbers in the Saline, St. Francis, Ouachita, and White rivers and other streams.

Lawlessness.—Two deputy marshals were killed, and others of their party were wounded, when on a raid to stop illicit distilling in the mountains of Pope County in August. The same month a white man was killed and another brutally beaten at a negro picnic near Kendall Mills; as a result, two negroes were lynched and another was shot, in an affray growing out of the affair.

Damage by Flood.—Great loss and suffering were caused in the spring by the heavy floods. The lowlands in eastern Arkansas were covered with water, houses were swept away, many animals were drowned, and some human lives were lost. Relief was sent from various sources, and the Legislature appointed a committee to investigate, and passed a law extending the time for payment of taxes.

Court Decisions.—The Wells-Fargo Express Company brought suit against a county collector, attacking the validity of an act by which the company was taxed, on the ground that the rule of assessment laid down in the act was unfair. Among other things, the act provides that the board in assessing the taxable property of such a corporation shall ascertain the value of the entire capital stock of such company, and shall therefore fix the sum

at which the property of any such express company shall be assessed in this State, by taking the same proportion of the aggregate value of the capital stock of such company as the number of miles of railway within this State over which it carries on its business bears to the aggregate number of miles of railway within as well as without the State over which such company does business. The company contended that this was unjust, because, while it carries on its business in this State exclusively on railways, in other States it carries it on over water ways as well, and has realty in other States, but none in this; and claims the value of its capital stock is based in part upon such realty and its business over water ways. The decision upheld the validity of the law.

By another Supreme Court decision it was declared that railroad companies are liable for the killing of dogs by trains through negligence.

In a case turning upon the liability of a corporation for negotiable paper issued by one of its officers, the decision held the corporation responsible.

Legislative Session.—The thirty-first biennial session of the Legislature began Jan. 13 and ended March 11.

W. L. Moose was elected president of the Senate, and J. C. Tappan Speaker of the House.

The total number of bills introduced in both branches was 558, of which 247 were in the Senate and 311 in the House. Of these 55 were passed.

Bills were introduced providing for a railroad commission, and much time was spent on them in debate, with the result only that a concurrent resolution was adopted proposing a constitutional amendment to be submitted to popular vote, authorizing the creation of a permanent railroad commission. Another constitutional amendment to be submitted authorizes the levy of a road tax not to exceed three mills.

An antitrust bill was passed, declaring all combinations made with a view to lessen, or tending to lessen, free competition, or to reduce or control prices, to be unlawful and void; and making the penalty the loss of charters for corporations, and for any person convicted of engaging in such business a fine of not less than \$500, or more than \$2,000, and imprisonment in the Penitentiary not less than one or more than ten years, or in the judgment of the court by either such fines or such imprisonment; the provisions of the act are not to apply to agricultural products or live stock while in the possession of the producer or raiser. It is further provided that any one injured or damaged by such a combination "may sue for and recover in any court of competent jurisdiction in this State of any person or persons or corporations operating such trusts or combination to the full consideration or sum paid by him or them for any goods, wares, merchandise, or articles, the sale of which is controlled by such combination or trust."

Another act provides that "hereafter it shall be unlawful for any keeper of a saloon or wholesale liquor dealer in Arkansas to keep, exhibit, use or suffer to be used in his saloon or place of business, or in any adjoining house subject to his direction or control, any musical instrument of any kind whatever, for the purpose of performing upon or having the same performed upon; neither shall he permit any fencing, sparring, boxing, wrestling, or other exhibition or contest of dexterity or strength; that it shall be unlawful for such persons to permit to be used in and about his saloon by any other person, to use or run in connection with such saloon in any manner or form whatever, any billiard table, pool table, or other table commonly used for gaming, bowling, tenpin alley, or any cards, dice, or other devices commonly used for gaming or playing

any game of chance. The penalty for violation of the law is a fine of from \$25 to \$100, forfeiture of license, and prohibition of renewed license for three years.

A quarantine law against Missouri horses and mules went into effect Feb. 6. It is like the Missouri law against Arkansas cattle, and is a retaliatory measure. Power is given by the act to the Commissioner of Mines, Manufactures, and Agriculture to extend or limit the operation of the act according as, in his judgment, the agricultural interests of the State require.

Other acts passed were:

For the construction of good roads.

To prevent disorderly conduct on legalized primary election days.

To protect conductors and other railroad employees: providing that any one who shall falsely report the men to their superior officers shall be deemed guilty of a misdemeanor, and fined not less than \$100 nor more than \$500, and be imprisoned in jail for six months.

To require railroads to carry bicycles as baggage.

To allow disabled and indigent ex-Confederate soldiers \$75 annually, whether they have families or not.

To amend the legalized primary election law.

Appropriating \$20,000 for county normal schools.

To tax barrel whisky houses in cities.

Allowing farmers to organize mutual fire insurance companies.

For the protection of railway passengers against imposition, fraud, and annoyance, providing a penalty of \$25 to \$50 for each offense.

Hon. James K. Jones was re-elected to the United States Senate. J. R. Sovereign was the candidate of the Populists, and Powell Clayton of the Republicans. The vote stood: Jones, 114; Sovereign, 9; Clayton, 3.

One incident of the session was the rejection of a resolution, offered Jan. 20, to restore a portrait of Washington to its former place over the Speaker's stand in the Hall of Representatives, from which it was taken six years ago to give place to a portrait of Jefferson Davis, and to place the latter on the left in the space now occupied by Washington's. Another was an excitement caused in the House, March 6, by the offering of a resolution to displace the portrait of Davis temporarily, and to substitute for it that of William J. Bryan during the latter's visit to Little Rock. There were loud cries of "No!" "Never!" "We'll never take Jeff Davis down!" and the like, and a motion to table the resolution prevailed without debate.

An important matter that came before the Legislature was that of the settlement of the debt of the State to the National Government. The origin and status of the claim are explained by Gov. Clarke as follows:

"For more than twenty years there has existed a troublesome and complicated dispute between the United States and the State of Arkansas, growing out of the ownership by the former of certain coupon bonds of the latter, and against which the latter asserted the right to offset an unliquidated claim for a failure upon the part of the former to patent to her a large quantity of land to which she became entitled under the act of Congress of Sept. 3, 1850, known as the swamp land grant, and various other acts. Under authority of acts of the General Assembly of 1889, and of the act of Congress of Aug. 4, 1894, the Governor, acting for the State of Arkansas, and the Secretaries of the Treasury and of the Interior, acting for the General Government, proceeded to consider these matters of difference, and on Feb. 23, 1895, concluded a settlement by which a balance of \$160,572 was, as

a final result, found to be due to the United States by the State of Arkansas.

"A bill to ratify the settlement was introduced into the Senate and House shortly after the agreement was signed, but consideration could not be obtained at the pending short session. At the regular session following bills for the same purpose were again promptly introduced. About this time Congress was flooded with anonymous circulars attacking the good name of the State and assailing in detail the fairness of the settlement so far as the interest of the United States was concerned. The leading newspapers of the country were also filled with a carefully prepared alleged *exposé* of a deliberate scheme upon the part of the State of Arkansas to rob the Smithsonian Institution of part of the funds provided by its founder to maintain it. After full debate, the Senate, by a large majority, passed the bill. After it reached the House it was, in the regular course, referred to the Committee on Public Lands. There the representatives of the Iron Mountain Railroad Company appeared to resist its passage. Their real purpose was, by exerting a pressure against the accomplishment of a thing very greatly desired by every interest of the State, to compel her, as the price of the forbearance of the lobby, to convey to the Iron Mountain Railroad Company and other railway companies title to 273,000 acres of land granted to the State by the swamp land grant of 1850. A majority of the committee recommended favorable action on the bill by the House only on condition that an amendment be adopted to the purport that the confirmation should not be effective unless the State should, within one year, release to the railway companies or their assigns all title or claim to the said 273,000 acres of land."

The compromise plan of settlement, including the amendments which, it is charged above, were obtained by the influence of the railroad, was agreed to by both houses of the Legislature, although Gov. Jones had given notice that he would veto the resolution if it were passed. The General Assembly adjourned without having passed any appropriation bills except those for payment of the legislative expenses, and for the county normal schools. The Senate rejected a resolution passed by the House extending the session to April 14. This made it necessary for the Governor to call an extraordinary session, which he did, naming April 26 as the date of opening.

The special session ended June 16. Fifty-one acts and three concurrent resolutions were passed. Among these were appropriations for expenses of the State government and for State institutions, and provisions for improvements of the levees. In view of the damage to property by drought and flood, the time for payment of taxes was extended, and the time for redemption of property forfeited for nonpayment was also extended one year. A joint committee was appointed to investigate the condition of sufferers by drought and flood. A $\frac{1}{2}$ -mill tax was provided for the payment of the interest on State bonds held by the permanent school fund.

Another attempt to secure a railroad commission was defeated. Three important acts concerning railroads were passed. One grants 500,000 acres of swamp lands to the Springfield, Little Rock and Gulf Company, on condition that it build 500 miles of road. The route is to be from Springfield, Mo., across Arkansas by way of Dardanelle and Little Rock, to Alexandria, La., and eventually to the Gulf. By another act, 40,000 acres of State lands are granted in aid of railroad construction westward from the Mississippi by way of Hamburg to Texarkana. The third measure is for the construc-

tion of State railroad and telegraph lines by convict labor. A State board is increased, which is to outline routes for roads and advertise for offers of money and other property. Whenever the sum of \$100,000 or its equivalent is subscribed for any one of the roads projected, the board may begin the construction, employing convicts.

Other measures were:

Concerning insolvency.

Providing for the purchase of a State convict farm.

Providing for improvement of public roads.

Appropriating \$55,000 for Confederate pensions.

Allowing State convicts to work on roads adjacent to convict camps.

Authorizing improvement district boards of cities and incorporated towns to mortgage waterworks and electric-light plants to secure payment of money borrowed, etc.

Amending the fish law.

Regulating the sale of native wine, and providing for a vote on the wine question in the counties.

To provide for payment of interest on the public debt.

ASSOCIATIONS FOR THE ADVANCEMENT OF SCIENCE. American.

The forty-ninth meeting of the American Association for the Advancement of Science was held in Detroit, Mich., during Aug. 9-14, 1897. The officers were: President, Oliver Wolcott Gibbs, Newport, R. I. Vice-presidents of the sections: A, Wooster W. Reman, Ann Arbor, Mich.; B, Carl Barus, Providence, R. I.;

OLIVER WOLCOTT GIBBS.

C, William P. Mason, Troy, N. Y.; D, John Galbraith, Toronto, Canada; E, Edward W. Claypole, Akron, Ohio; F, Leland O. Howard, Washington city; G, George F. Atkinson, Ithaca, N. Y.; H, W. J. McGee, Washington city; I, Richard T. Colburn, Elizabeth, N. J. Permanent secretary, Frederick W. Putnam, Cambridge, Mass. (office, Salem, Mass.). General secretary, Asaph Hall, Jr., Ann Arbor, Mich. Secretary of the council, David S. Kellcott, Columbus, Ohio. Secretaries of the sections: A, James McMahon, Ithaca, N. Y.; B, Frederick Bedell, Ithaca, N. Y.; C, Paul C. Freer, Ann Arbor, Mich.; D, John J. Flather, Lafayette, Ind.; E, C. H. Smyth, Jr., Clinton, N. Y.; F, Charles C. Nutting, Iowa City, Iowa; G, Frederick C. Newcombe, Ann Arbor, Mich.; H, Anita Newcomb McGee, Wash-

ington city; I. Archibald Blue, Toronto, Canada. Treasurer, R. A. S. Woodward, New York city.

Opening Proceedings.—The usual regular preliminary meeting of the council with which the association begins its sessions was held in the Hotel Cadillac, which was the headquarters of the association on Aug. 7, at noon. At this session the final details pertaining to the arrangements of the meetings were settled, and the reports of the local committees acted on. The names of 52 appoints for membership were then favorably considered. The general session with which the public meetings began was held in the auditorium of the Central High School at 10 a. m. Aug. 9. The meeting was called to order by Secretary Putnam, who, after referring to the death of President Cope, presented his successor, Prof. Gill, who promptly declared the meeting open, and then called to the chair the senior vice-president of the association present, Mr. W. J. McGee, who acted as presiding officer in the place of President Gibbs, who was unable to attend on account of illness. A short prayer was made by the Rev. Frank J. Van Antwerp, and then a tenor sang "A Song of Thanksgiving," by Marshall Pease, followed. The Hon. William C. Maybury, Mayor of Detroit, then welcomed the association in a short but pleasant address, in the course of which he said: "We are a scientific city. There was formed here years ago a society by that good man Bela Hubbard out of which grew your organization which is now in session here. We are founded on science, and in this building for a place of meeting we offer you a temple of science which affords you an environment that must have its influence upon your work within its halls." He was followed by Hon. Thomas W. Palmer, former United States Senator for Michigan, who spoke more at length and offered for the consideration of the association the following apt definition of science. He referred to it as "a classification of phenomena so arranged that general principles may be reduced upon which rules of action may be established in particular cases." Mr. McGee replied to both addresses in fitting words, after which a duet, "Contentment," was rendered by Miss Mary L. Denison and Mr. Pease. The usual announcements then followed by the permanent, the general, and the local secretaries, and then Miss Denison sang "The Danza," at the close of which the meeting adjourned.

Address of the Retiring President.—Owing to the death of Edward D. Cope, the retiring president, on April 13, 1897, the council of the American Association designated the senior vice-president, Theodore N. Gill, of Washington city, to succeed to the presidency at the Detroit meeting. Prof. Gill was invited to present an address that should be descriptive of the work of Cope. As the scientific careers of Gill and Cope began simultaneously—that is, their first published contributions to science were accepted for publication on April 29, 1859, by the Academy of Natural Sciences in Philadelphia—and as they had been friends ever since, no more appropriate subject could have been chosen by Prof. Gill. The association convened to hear this address in the auditorium of the Central High School at 8 a. m. on Aug. 9. The title given to his address by Prof. Gill was "Edward Drinker Cope, Naturalist: A Chapter in the History of Science." After relating his own long friendship with Cope, as indicated above, he gave a brief biographical sketch of the more important events in the life of the deceased naturalist, and then considered successively his contributions to herpetology, ichthyology, mammalogy, and paleontology, after which he examined his philosophical views, especially those relating to evolution, closing with an attempt to forecast the position he is destined to occupy in

the history of science. Of the first named he said: Cope, "found herpetology an art; he left it a science; he found it a device mainly for the naming of specimens; he left it the expression of the coordination of all structural features. The reformations he effected in the classification of the anurous amphibians and the saurian reptiles were especially notable." The ichthyological labors of Cope he described as "unusually valuable contributions to science, and the progress of ichthyology has been much accelerated, not only by these labors,

THEODORE N. GILL.

but by the investigations they challenge." Concerning his work on mammals, he said that "he always considered the old and new—the extinct and recent—forms together. He refused to be bound by consistency or by precedent, either set by himself or others. Fresh discoveries opened new vistas to him, and he modified his views from time to time, and as often as he received new evidence." Most of Cope's contributions to the science of paleontology were discussed by Prof. Gill in the various branches, as above enumerated, to which the fossils properly belonged, but he made reference to his publications on palæontology, and closed that section with these words: "The evolution of the various animal, and especially mammalian types, was also continually the subject of Cope's researches, and he attempted to trace the passage from those of the most ancient periods to those of later ones." Concerning his philosophical views, Prof. Gill said: "The transmission of acquired characters was one of the accepted and most cherished dogmas of Cope, and the belief in transmissibility of such characters is an essential of the creed of so many who have become his followers in America, that a special school came into existence known as the Neo-Lamarckian and also as the American school."

In closing, he compared Cope with Cuvier, Owen, and Huxley, and said: "Cope covered a field as extensive as any of the three. His knowledge of structural details of all the classes of vertebrates was probably more symmetrical than that of any of those with whom he is compared; his command of material was greater than that of any of the others; his industry was equal to Owen's; in the clearness of his conceptions he was equaled by Huxley alone; in the skill with which he weighed discovered facts, in the aptness of his presentation of those facts, and in the lucid methods by which the labor of the

student was saved, and the conception of the numerous propositions facilitated, he was unequalled. His logical ability may have been less than that of Huxley and possibly of Cuvier. He has been much blamed on account of the constant changes of his views, and because he was inconsistent. Unquestionably he did change his views very often. Doubtless some of those changes were necessitated by too great haste in formulation and too great rashness in publication. The freedom to change which he exercised, and which was exercised too little by at least one of his predecessors, was an offset to his rashness. He exercised a proper scientific spirit in refusing to be always consistent at the expense of truth.

Proceedings of the Sections.—The association is divided into 9 sections, each of which is presided over by an officer having the rank of vice-president of the association. Subsequent to the opening proceedings, each section meets by itself and effects its organization by electing a fellow to represent it in the council, a sectional committee of 3 fellows, a fellow or member to the nominating committee, and a committee of 3 members or fellows to nominate officers of the section for the next meeting. As soon as this organization is effected the secretary of the section reports to the general secretary, who then provides him with a list of papers that, having been considered suitable by the council, may be read and discussed before the section. A press secretary, whose duties are to prepare abstracts of the papers read, and to give them to reporters of newspapers, is also commonly chosen.

A. Mathematics and Astronomy.—This section was presided over by Prof. Wooster W. Beman, who fills the chair of Mathematics in the University of Michigan, Ann Arbor. The subject of his address was "A Chapter in the History of Mathematics." It was a sketch of the development of the geometric treatment of the imaginary, particularly in the latter part of the eighteenth and the first part of the nineteenth centuries. The speaker referred, in opening, to the fact that the square root of a negative quantity appeared for the first time in the "Stereometria" of Heron of Alexandria, n.c. 100. From this date the development of the use of the square root applied to a negative number was briefly traced through several centuries, accompanied by quotations and arguments from the various writers who attempted the problem. He devoted much attention to the memoir by Caspar Wessel, entitled, "An Essay on the Analytic Representation of Direction, with Applications in Particular to the Determination of Plane and Spherical Polygons," which was published in 1797, claiming for it that it was the first clear, accurate, and scientific treatment of directed lines in the same plane. He referred to the later works of Bucci, Argand, and Warren, and closed with: "Such were the beginnings of the study of the geometric representation of the imaginary, which has led in modern times to the establishment of such great bodies of doctrine as the theory of functions on the one side and quaternions on the other, with the *Ausdehnungslehre* occupying a position between. Who can tell what the next century may bring forth?"

The following-named papers were read and discussed before the section: "A Problem in Substitution Groups," by George A. Miller; "Continuous Groups of Spherical Transformations in Space," by Henry B. Newson; "Commutative Matrices," by James B. Shaw; "On the Theory of the Quadratic Equation," by Alexander Macfarlane; "Condition that the Line common to $n-1$ Planes in an n -Space may lie on a Given Quadratic Surface in the Same Space," by Virgil Snyder; "The Psychology of the Personal Equation," by Truman H. Safford; "Com-

pound Determinants," by William H. Metzler; "Waters within the Earth," by William S. Auchincloss; "On the Semiar Motion of the Earth's Magnetic Axis" and "Simple Expressions for the Diurnal Range of the Magnetic Inclination and of the Magnetic Inclination," by Louis A. Baker; "The Theory of Perturbations and the Theory of Contact Transformations," by E. O. Lovett; "On Rational Right Triangles, No. I," by Artemus Martin; "Some Results in Integration expressed by the Elliptic Integrals," by James McMahon; "Modification of the Eulerian Cycle due to Inequality of the Equatorial Moments of Inertia of the Earth" and "Integration of the Equations of Rotation of a Spheroidal Mass for the Case of Equal Principal Moments of Inertia," by Robert S. Woodward; "General Theorems concerning a Certain Class of Functions deduced from the Properties of the Newtonian Potential Function," by James W. Glover; "The Importance of adopting Standard Systems of Notation and Co-ordinates in Mathematics and Physics," by Frank H. Bigelow; "Stereoscopic Views of Spherical Catenaries and Gyroscopic Curves," by Alfred G. Greenhill; and "A Remarkable Complete Quadrilateral among the Pascal Lines of an Inscribed Six-Point of a Conic," by R. Daniel Bohannan.

On Aug. 12 a joint meeting of Sections A and B was held, at which the following papers were read: "On the Electrostatic Capacity of a Two-Wire Cable," by George W. Patterson, Jr.; "Reasoning Effects of Induced Currents in Solid Magnetic Bodies in an Alternating Field," by Charles P. Steinmetz; "The Treatment of Differential Equations by Approximate Methods," by William F. Durand; and "A New Method of solving Certain Differential Equations that occur in Mathematical Physics," by Alexander Macfarlane.

B. Physics.—The presiding officer of this section was Prof. Carl Barus, who fills the chair of Physics in Brown University. His inaugural address was on "Long-Range Temperature and Pressure Variables in Physics." He began by giving a history of the various attempts to provide suitable apparatus for high-temperature measurement. Fusion first played an important part in the manufacture of thermoscopes, and later those instruments based on specific heat showed an advantage over the fusion instruments. The gas thermometer was referred to as the only fruitful method of absolute pyrometry. The speaker dwelt at length on high-temperature work, the first thorough-going instance of which was by Prussip in 1829. Then the experiments down to 1887 were considered in detail, and the conclusion reached that the data furnished by the Reichsanstalt will eventually be standard. "For the present," he said, "I should be more impressed by some sterling novelty either in the direction of a larger range of measurement or of method. Conceding that an accuracy of 5° at 1,000 has been reached, all results above 1,500° remain none the less subject to increasingly hazardous surmise." Turning to the applications of pyrometry, he referred to the variation of metallic ebullition with pressure. Results already attained show an effect of pressure regularly more marked as the normal boiling point is higher. Igneous fusion was considered in its relation to pressure and with regard to the solidity of the earth, and the inference was drawn that the interior solidity of the earth, now generally admitted, is due only to superincumbent pressure, withholding fusion. The question of heat conduction was next taken up, and the results deduced by various writers as to the age of the earth discussed. High-pressure measurement was lengthily dealt with. Passing from this subject, the entropy of liquids was considered. "This subject is only in its infancy," he said, "and

only a year ago were any results of a satisfactory nature obtained." The paper ended with a reference to sublimals and several kindred subjects.

The following-named papers were read and discussed before the section: "The Design, Construction and Test of a 1,250 Watt Transformer," by Henry S. Carhart; "Electrolytic Action in a Condenser," by Karl E. Guthe; "The Magnetic Survey of Maryland," by Louis A. Bauer; "The Transmission of Radiant Heat by Gases at Varying Pressures," and "The Measurements of Small Gaseous Pressures," by Charles F. Brush; "On the Rate at which Hot Glass Absorbs Superheated Water" and "A Method of obtaining Capillary Canals of Specific Diameter," by Carl Barus; "A New Method of determining the Specific Heats of Liquids," by Robert L. Litch; "On the Coefficient of Expansion of Certain Gases," by Edward W. Morley and Dayton C. Miller; "The Effect of Heat on the Elastic Limit and Ultimate Strength of Copper Wire," by Frank P. Whitman and Mary C. Noyes; "Kites and their Use by the Weather Bureau in Explorations of the Upper Air," by Charles F. Marvin; "Experiments upon the Acetylene-Oxygen Standard of Light," by Clayton H. Sharp; "Arc Spectra," by Arthur L. Foley; "On the Brightness of Pigmented Surfaces under Various Sources of Illumination," by Frank P. Whitman; "Note on the Construction of a Sensitive Radiometer," by Ernest F. Nichols; "Photographs of Manometric Flames," by Edward L. Nichols and Ernest Merritt; "The Discharge of Electrified Bodies by X-Rays," by Clement D. Child; "A Final Determination of the Relative Lengths of the Imperial Yard of Great Britain and the Meter of the Archives," by William A. Rogers; "An Electrical Thermostat," by Willis R. Whitney; "An Apparatus for Testing the Law of Conservation of Energy in the Human Body," by Wilbur O. Atwater and Edward B. Rosa; "The Electric Conductivity of Certain Specimens of Sheet Glass, with Reference to their Fitness for Use in Static Generators," by Dayton C. Miller; "Graphical Treatment of Alternating Currents in Branch Circuits in Case of Variable Frequency," by Henry T. Eddy; "On Simple Nonalternating Currents," by Alexander Macfarlane; "Exhibition of Instruments for determining the Frequency of an Alternating Current," by George S. Moler and Frederick Bedell; "The Predetermination of Transformer Regulation," by Frederick Bedell, Richard E. Chandler, and R. H. Sherwood, Jr.; "The Effect of Pressure on the Wave Lengths of the Lines of the Emission Spectra of the Elements," by W. J. Humphreys; "A New Form of Coal Calorimeter," by Charles L. Norton; "Notes on the Recent History of Musical Pitch in the United States," by Charles R. Cross; "A New Form of Harmonic Analyzer," by Frank A. Laws; "The Determination of the Surface Tension of Water and of Certain Aqueous Solutions by Means of the Method of Ripples," by N. Ernest Dorsey; "The Series of International Cloud Observations made by the United States Weather Bureau and their Relation to Meteorological Problems," by Frank H. Bigelow; "The Effects of Tension and Quality of the Metal upon the Changes in Length produced in Iron Wires by Magnetization," by Byron B. Brackett; "Electrical Resonance and Dielectric Hysteresis," by Edward B. Rosa and Arthur W. Smith; "A Method of the Determination of the Period of Electrical Oscillations and Other Applications of the same," by Margaret E. Molby; "The Influence of Time and Temperature upon the Absolute Rigidity of Quartz Fibers," by Samuel J. Barnett; and "On the Methods of Measuring Mean Horizontal Candle Power," by C. P. Matthews.

C. Chemistry.—Prof. William P. Mason, who occupies the chair of Chemistry in the Rensselaer

Polytechnic Institute of Troy, N. Y., presided over this section. His subject was on "Expert Testimony." This address not only covered the entire ground from the standpoint of practical experience, looking at the question both through the eyes of the lawyer and the expert, but was also a compact syllabus, pointing out the province of the expert, reviewing errors that he might be subject to, and suggesting the solution for numerous difficulties. Concerning the duties of an expert, he said: "It is a fatal error to know too much, and a pit into which the expert may fall is prepared for him by questions leading him to venture an opinion upon matters outside of his specialty. Terse, clear answers, well within the narrow path leading to the point in question is the only safe way, and when the line of inquiry crosses into regions where the witness feels himself unsafe his proper course is to refuse to answer. Unfortunately, the expert is often invited to take these collateral flights by the side employing him, as well as by the opposition. An expert, especially in early cases, is sure to have authorities quoted against him, so it behooves him to be familiar with the literature of the subject, so as to be able to point out that such and such a writer is not up to date, or that, if the entire passage is quoted in full, it would not carry the adverse construction that its partial presentation carries." In conclusion, he said: "The expert witness should be absolutely truthful; of course that is assumed, but beyond that he should be clear and terse in his statements, homely and apt in his illustrations, incapable of being led beyond the field in which he is truly an expert, and as fearless of legitimate ignorance as he is fearful of illegitimate knowledge. Mounting the witness stand with these principles as his guide, he may be assured of stepping down again with credit to himself and to the profession he represents."

This section met in conjunction with the American Chemical Society, many of whose members were also members of the chemical section of the American Association. The papers presented to either organization were grouped under seven heads and were presented before subsections as follows: Organic chemistry, presided over by Albert B. Prescott; inorganic chemistry, presided over by William A. Noyes; analytical chemistry, presided over by Louis M. Dennis; agricultural chemistry, presided over by Harvey W. Wiley; industrial chemistry, presided over by William McMurtrie; physical chemistry, presided over by Arthur A. Noyes; and physiological chemistry, presided over by Harvey W. Wiley.

The following-named papers were read and discussed before the section: "Alkyl Bismuth Iodides" and "Kola Tannin," by Albert B. Prescott; "The Chemistry of Methylenes," by John U. Nef; "On the Action of Sodium on Methylpropylketone and on Acetophenone" and "On the Constitution of some Hydrzones," by Paul C. Freer; "The Decomposition of Heptane and Octane at High Temperatures," by Arthur W. Burwell; "Derivatives of Eugenol," by F. J. Pond and F. F. Beers; "Determination of the Volatility of Phosphorus Pentoxide," by Edward W. Morley; "Recent Progress in Analytical Chemistry" and "A New Form of Discharger for Spark Spectra of Solutions," by Louis M. Dennis; "Qualitative Analysis: A Point in Teaching that was, not a Full Success," by Arthur L. Green; "A New Color Standard for Use in Water Analysis" and "Contributions from the Laboratory of Water Analysis, Massachusetts Institute of Technology," by Ellen H. Richards; "A Comparison of Methods for determining Carbon Dioxide and Carbon Monoxide," by Louis M. Dennis and C. G. Edgar; "A Preliminary Thermo-Chem-

ical Study of Iron and Steel," by Edward D. Campbell and Firman Thompson; "Further Study on the Influence of Heat Treatment and Carbon upon the Solubility of Phosphorus in Steel," by Edward D. Campbell and S. C. Babcock; "The Chemical Composition of Cement Plaster," by Edgar H. S. Bailey; "The Decomposition of Halogen-Substituted Acetic Acids by Water," by E. A. De Bar; "On the Determination of Fat and Casein in Feeces," by Herman Poole; "On Reactions between Mercury and Concentrated Sulphuric Acid," by Charles Baskerville and F. W. Miller; "Apparatus for Photometric Determination of Humic and Sulphuric Acids," by J. I. D. Hinds; "Position in the Periodic Law of the Important Elements found in Plant and Animal Bodies," by Harry Snyder; "On Solutions of Silicates of the Alkalies," by Louis Kahlenberg and A. T. Lincoln; "The Electrical Conductivity and Electrolysis of Certain Substances dissolved in Liquid Ammonia," by Hamilton P. Cady and Edgar H. S. Bailey; "The Rate of Solution of Solid Substances in their own Solutions," by Arthur A. Noyes and Willis R. Whitney; "The Stereometric Measurement of the Velocity of a Reaction," by Willis R. Whitney; "Some Contributions to Methods of Testing Flour," by Robert C. Kedzie; "Distillation in General," by Leon Labonde; "An Electrical Laboratory Stove," by M. D. Sohon; "Recent Progress in Agricultural Chemistry," by Harvey W. Wiley; "Calculations of Calorimetric Equivalents of Agricultural Products from Chemical Analysis," by Harvey W. Wiley and Willard D. Bigelow; "On the Solubility of Pentosans," by William H. Krug and Harvey W. Wiley; "Detection of Foreign Fats in Butter and Lard," by C. B. Cochran; "The Action of Certain Bodies on the Digestive Ferments," by Frank D. Simons; "The Bacteriological Products of Hog Cholera and Swine Plague," by Emil A. De Schweinitz; "Recent Progress in Industrial Chemistry," by William McMurtrie; "Annual Report on Indexing Chemical Literature," by Henry C. Bolton; and "A Continuously Revised Compendium of Chemistry," by Ervin K. Ewell.

D. Mechanical Science and Engineering.—Over this section Prof. John Galbraith, of Toronto, Canada, presided, and he discussed "The Groundwork of Dynamics" in his address. In opening he said that "the subject of dynamics is too often treated as if it were a department of applied mathematics rather than of mechanical science. It is necessary that the student of dynamics should know something of mathematics. It is not required of him to be an expert in refined mathematical analysis, but he should possess in some degree the mechanical instinct." The speaker then gave a history of dynamics from the day when the experiments were carried on with the rudest machinery down to the present time. His closing remarks were descriptive of the status of the science of dynamics as it is understood at the present time. He said it "includes among its fundamental principles, in addition to the law of motion, the principle of the equivalence of work and energy and the principle of the conservation of energy, energy being measured, however, only in terms of force and displacement, or momentum and velocity. The only actions known in dynamics are force and its integrals—impulse and work. To identify with these all the other actions involving the transfer and transformation of energy—such as the conduction of heat, chemical reactions, induction of electric currents, etc.—forms to-day the severest task of mathematical physics."

The following-named papers were read and discussed before the section: "Development of Engineering Industries by Scientific Research," by

William S. Aldrich; "The Cement Laboratory as a Field for Investigation," by Frank P. Spalding; "The Effect of Spark Losses on the Efficiency of Locomotives," by William F. M. Goss; "A New Apparatus for Testing Indicator Springs," by Mortimer E. Cooley; "Flue Gas Analysis in Boiler Tests," by Daniel S. Jacobus; "Effect of Temperature on the Strength of Steel" and "The Properties of Aluminium Alloys," by Holla C. Carpenter; "Analysis of Composite, Concrete, and Iron Beams" and "Definition of Elastic Limit for Practical Purposes," by John P. Johnson; "Theories of Some Planimeters without the Aid of Calculus," by Forrest R. Jones; "The Production of X-Rays by Means of the Planté Accumulator, in which Voltage is chiefly concerned, the Effect of Current being largely eliminated," by William A. Rogers; "A Universal Alternator for Laboratory Purposes," by Henry S. Carhart; "Calculation of the Energy Loss in Armature Cores," by W. E. Goldsborough; "A New Formula for determining the Width of Leather Belting" and "A Graphical Solution of Belting Problems," by John J. Flather; "On Engineering Conditions connected with the mounting of Instruments used on Eclipse Expeditions," by David P. Todd; and "On a Machine for measuring Friction under Heavy Pressures," by T. Gray.

E. Geology and Geography.—The presiding officer elected for this section was Prof. Israel C. White, of the University of West Virginia, who was absent from the country, having gone to Russia to attend the International Congress of Geologists, and therefore Prof. Edward W. Claypole, of Buchtel College, Akron, Ohio, was nominated by the council to preside. The address of Prof. White, however, on "The Pittsburg Coal Bed" was read before the section by Prof. Herman L. Fairfield. The age, area, and structure of this formation were carefully gone over, and the geological elements and features of the great Appalachian coal field elaborated in the hope, as the author said, "of emphasizing the necessity and importance of observing the smaller details of stratigraphy more closely." Prof. White criticised the United States Geological Survey for entertaining the theory that no coal bed can be certainly identified beyond the area of its continuous outcrop. This, he claimed, gives a local name to every isolated area, thus adding greatly to the burden of geological nomenclature, a fault of geologists everywhere. He urged a reform in the methods of work which led to such undesirable results.

During the sessions on Tuesday, Aug. 10, and Wednesday, Aug. 11, the Geological Society of America met with this section, during which time papers presented before that body only were read. Subsequently the following-named papers were read and discussed before the section: "Stylolites," by Thomas C. Hopkins; "A Suggestion in regard to the Theory of Volcanoes," by William N. Rice; "The Ores and Minerals of Cripple Creek, Colorado," by F. D. Smythe and H. P. Parmelee; "Observations on the Genus *Barrettia*," by Robert P. Whitfield; "An Account of the Researches relating to the Great Lakes," by John W. Spencer; "Lake Chicago and the Chicago Outlet," by Frank Leverett; "The Lower Abandoned Beaches of Southeastern Michigan" and "Some Features of the Recent Geology around Detroit," by Frank B. Taylor; "Recent Earth Movement in the Great Lake Region," by Grove K. Gilbert; "Preglacial Topography and Drainage of Central-Western New York," by Herman L. Fairchild; "Progress of Hydrographic Investigations by the United States Geological Survey," by Frank H. Newell; "The Lower Carboniferous of Huron County, Michigan," by A. C. Lane; "The Geological Age and Fauna

of the Huerfano Basin in Southern Colorado," by Henry F. Osborn; "A Supplementary Hypothesis respecting the Origin of the American Loess," by Thomas C. Chamberlain; and "Ice Jams and what they accomplish in Geology," by Major A. Veeder.

F. Zoology.—This section was presided over by Dr. Leland O. Howard, entomologist of the Department of Agriculture, Washington city, who had been nominated by the council to fill the vacancy caused by the death of Dr. G. Brown Goode. Dr. Howard spoke on "The Spread of Species by the Agency of Man, with Special Reference to Insects." He showed that natural spread was for centuries the rule, but that with the improvement of commercial intercourse between nations the agency of man has become predominating. He spoke of the international introduction of useful plants from foreign countries, and of the occasional introduction of flowering species which escape from cultivation and became weeds. The intentional introduction of wild animals has generally been disastrous. He instanced the introduction of the English sparrow, of the Indian mongoose into Jamaica, of the flying foxes from Australia into California, of the gypsy moth from Europe into North America. Accidental introductions have been more powerful in extending the range of species and in changing the character of the plants and animals of given regions than intentional introductions. The era of accidental importations began with the beginning of commerce and has grown with the growth of commerce. The vast extensions of international trade of recent years, every improvement in rapidity of travel and in safety of carriage of goods of all kinds, have increased the opportunities of accidental introductions, until at the present time there is hardly a civilized country which has not firmly established and flourishing within its territory hundreds of species of animals and plants of foreign origin, the time and means of introduction of many of which can not be exactly traced, while of others even the original home can not be ascertained, so widespread has their distribution become.

The following-named papers were read and discussed before this section: "On the Relationships of the Nematognaths," by Theodore Gill; "On a Collection of Cephalopoda from the 'Albatross' Expedition," by William E. Hoyle; "On the Characters of the Brains of Nematognaths and Plectospondyls," by Benjamin T. Kingsbury; "The Insect Fauna of *Cereus giganteus*," by Henry G. Hubbard; "On the Sarcostyles of the Plumularidae," by Charles C. Nutting; "A Study of the Development of *Drasteria erechta*" and "Brood XVI of *Cicada septendecim*," by Francis M. Webster; "Notes on the Embryology of the Pig" and "Harvard Embryological Collection," by Charles S. Minot; "Geological Distribution of the Golden Warblers," by Harry F. Oberholser; "On the Malodorous Carabid, *Nomius pygmaeus*," by Walter B. Barrows; "Remarks on the Distribution of Scale Insect Parasites," "A Valuable Cecidid," "Temperature Experiments as affecting the Received Ideas on the Hibernation of Injurious Insects," and "Additional Observations on the Parasites of *Orgyia leucostigma*," by Leland O. Howard; "Characters for distinguishing the North American Species of *Ceresa*," by William H. Ashmead; "The Peach Twig Borer (*Anarsia lineatella*)," by Charles L. Marlatt; "A Successful Lantern Trap" and "Vernacular Names of Insects," by Charles P. Gillett; "On the Preparation and Use of Arsenate of Lead as an Insecticide," by Philip H. Rolfs; "Insects of the Year," by Francis M. Webster and C. W. Malley; "Reconstruction of *Phenacolus primævus*, the Most Primitive Ungulate," "Homologies and

Nomenclature of the Elements of the Molar Teeth," "Modification and Variation, and the Limits of Organic Selection," and "Skeletons and Restorations of Tertiary Mammalia," by Henry F. Osborn. Also a joint session of Sections F and G was held on Aug. 11, when a discussion was held on "Organic Selection," in which Henry F. Osborn and Edward B. Poulton were the chief participants.

G. Botany.—The presiding officer of this section was Prof. George F. Atkinson, of Cornell University, Ithaca, N. Y. His address was on "Experimental Morphology." He discussed the various points of view held by different authorities during the last one hundred and fifty years, and claimed that the leading idea in the study of morphology held by these authorities during this period was the inductive method for the purpose of discerning fundamental principles and laws, not simply the establishment of individual facts, which was especially characteristic of the earlier period when the dogma of the constancy of species prevailed. Other points of view were considered and the speaker gradually worked his way up to the proposition as to whether a new period in the study of comparative morphology had not been entered on. Then passing direct to the subject of his address, he referred to experimental morphology as including in its broadest sense the domain of cellular morphology and the changes resulting from the directive or taxis forces accompanying growth, but it was rather to experimental morphology as applied to the interpretation of the modes of progress followed by members and organs in attaining their morphologic individuality in the tracing of homologies, in the relation of members associated by antagonistic or correlative forces, the dependence of diversity of function in homologous members on external and internal forces, as well as the course which determines the character of certain paternal or maternal structures, that he discussed, and perhaps even more restrictedly the experimental evidences touching the relation of the members of the plant, as expressed in the metamorphosis theory of the idealistic morphology, which subject the speaker then discussed very fully and elaborately, giving numerous illustrations to emphasize his ideas, taken from recent investigations by prominent botanists published within the last ten years.

The following-named papers were read and discussed before the section: "Changes during Winter in the Perithecia and Ascospores of Certain Erysipheæ" and "The Erysipheæ of North America: A Preliminary Account of the Distribution of the Species," by Benjamin T. Galloway; "Some Contributions to the Life History of *Hamatococcus*," by Lewis R. Jones; "'Bacteriosis' of Carnations," by Albert F. Woods; "Wakker's Hyacinth Bacterium," "Description of *Bacillus phaseoli*, New Species, with Some Remarks on Related Species," and "On the Nature of Certain Pigments produced by Fungi and Bacteria, with Special Reference to that produced by *Bacillus solanacearum*," by Erwin F. Smith; "Notes on Jamaica," by Douglas H. Campbell; "Notes on Some New Genera of Fungi" and "Comparison of the Pollen of *Pinus*, *Taxus*, and *Peltandra*," by George F. Atkinson; "Reproductive Organs and Embryology of *Drosera*," by Clayton A. Peters; "Development of Some Seed Coats," by Julius O. Schlotterbeck; "Morphology of the Flower of *Asclepias Cornuti*," by Fanny E. Langdon; "Report upon the Progress of the Botanical Survey of Nebraska," "Are the Trees receding from the Nebraska Plains?" and "Some Characteristics of the Foothill Vegetation of Western Nebraska," by Charles E. Bessey; "On the Distribution of Starch in Woody Stems," by Bohumil Shimek; "Mechanism of Root Curva-

ture," by J. B. Pollock; "Trillium grandiflorum (Michx.) Salisb.: Its Variations, Normal and Teratological," by Charles A. Davis; "Contributions on Wild and Cultivated Roses of Wisconsin and Bordering States," by J. H. Schuette; "A Discussion of the Structural Characters of the Order Pezizales of Schroeter," by Elias J. Durand; "The Taxonomic Value of Fruit Characters in the Genus *Galium*," by Karl M. Wiegand; "The Toxic Action of Phenols on Plants," by Rodney H. True and C. G. Hunkel; "Cellulose Ferment," by Frederick C. Newcombe; "Is the Characteristic Acridity of Certain Species of the Arum Family a Mechanical or a Physiological Property or Effect?" by Charles P. Hart; "How Plants flee from their Enemies," by William J. Beal; "Movements of *Phyllanthus*," by Daniel T. MacDougal; "Stomata on the Bud Scales of *Abies pectinata*," "Comparative Anatomy of the Normal and Diseased Organs of *Abies balsamea* (L.) Mill., affected with *Aecidium elatinum* (Alb. et Schwein.)," and "On a New and Improved Self-Registering Balance," by Alexander P. Anderson; "The Correlation of Growth under the Influence of Injuries," by Charles O. Townsend; and "The Botanical Collection of the Cornell Arctic Expedition of 1896," by W. W. Rowlee and Karl M. Wiegand.

H. Anthropology.—The presiding officer of this section was Mr. W. J. McGee, of the Bureau of American Ethnology, Washington city. The secretary originally elected for this section was Harlan I. Smith, of New York city, but as he was unable to be present, Dr. Anita N. McGee was chosen to fill the vacancy. Mr. McGee addressed the section on "The Science of Humanity." After discussing the views of students and the definitions of lexicographers, humanity was defined as (1) attributes or characteristics confined to human beings, comprising (a) the condition or quality of being human—i.e., of acting, feeling, and thinking after the manner of human beings, (b) the character of being humane, and (c) the character of being well-bred; (2) mankind collectively; (3) secular learning and literature. "The supreme importance of humanity as thus defined is indicated by the fact that it is the foremost subject-matter of thought and speech and literature among all peoples, its prominence increasing from savagery through barbarism and civilization and culminating in enlightenment. Just as living things rise above the mineral world by the possession of vitality, and as animals rise above plants by the possession of motility, so do human beings rise above all other things by the possession of specific attributes rooting in mentality and maturing in the complex activities of collective life; or just as inorganic matter is the basis for the essentially distinct organic existence, so organic matter and processes form the basis for the essentially distinct superorganic activities of human existence." The development of knowledge in general was so set forth as to indicate the scientific method, and the growth of exact knowledge was indicated by a review in which it was shown that science has progressed from the rare to the common, from the remote to the near, from the abnormal to the normal, from the merely qualitative to the quantitative, from the material aspect to the physical aspect, and from primitive faith in fixity to living realization of causal succession. Turning specially to man, it was shown that scientific study began with abnormal aspects and conditions of the human body and developed into a science of the body frequently called somatology; that scientific study, shaped largely by the methods of biology, extended to the races of men or ethnology, and that during recent years research has been concentrated on the human brain and its operations through the mod-

ern science of psychology. Noting that these branches of knowledge pertain to the animal side of man, it was shown that human handiwork next received scientific scrutiny, that the science of archaeology was based on them, and that archaeology and ethnology were long regarded as constituting the whole of anthropology. "At first the products of ancient and alien handiwork were accepted at their token value, much like the chemic elements before Avogadro, the planetary movements before Newton, our sun and others before the doctrine of the persistence of motion, the organic species before Darwin; but within a generation or two it has come to be realized that they possess an innate value as exponents of intellectual activity—as ideals of human creation, collectively attesting the birth and growth of discovery and invention, design and motive, and all other human faculties. . . . When the anthropologist first saw in the implement of shell or stone an index to the mental operations of the implement maker hardly less definite than the written page to the thought of the writer, the science of man rose to a higher plane with a bound comparable to those marking great epochs in the development of the other sciences." Then the activities were classified, and serve to define five sciences of humanity—viz., the fine arts or aesthetics, giving basis for aesthetology; industries, forming the object matter of technology; organizations or institutions, affording foundation for sociology; language and literature, with their science of philology; and the great plasma of knowledge, forming the object matter of sophiology. These five sciences are sometimes combined under the term demonomy, in contradistinction from physical anthropology; and this system of organized knowledge concerning wholly human things is designated the greater science of humanity.

The following-named papers were read and discussed before the section: "Prehistoric Implements from Charlevoix, Michigan," by H. P. Parmelee; "An Archaeological Map of Ohio," by Warren K. Morehead; "The Right of Adoption as practiced by the Osage Tribe," and "The Import of the Totem: A Study of the Omaha Tribe," by Alice Fletcher; "Micmac Mortuary Customs," by Stansbury Hagar; "Recent Researches, by George Byron Gordon, on the Banks of the Ulva River in Honduras, for the Peabody Museum" and "The Jesup Expedition and the Asiatic-American Problem," by Frederic W. Putnam; "The Tagbanuas of the Philippines," and "The Mangyan of the Philippines," by Dean C. Worcester; "The Significance of John Eliot's Natick," by William W. Tooker; "A Description of an Ancient Skeleton found in Adobe Deposits in the Valley of Mexico" and "Anthropologic Work of New York State Pathological Institute," by A. Hrdlicka; "The Ethnologic Arrangement of Archaeologic Material" and "Popular Anthropology in Museums," by Harlan I. Smith; "An Experimental Analysis of the Relations of Rate of Movement to Certain Other Mental and Physical Processes," by Lightner Witmer; "A Statistical Study of Eminent Men," by J. McKeen Cattell; "A Case of Trepanning in Northwestern Mexico," by Carl Lumboltz; "Decorations of the Teeth in Ancient America," by Marshall H. Saville; "The Artificialization of Animals and Plants," by Otis T. Mason; "The Origin of Art as manifested in the Work of Prehistoric Man," by Thomas Wilson; "The Superstitions, Beliefs, and Practices of the Ancient Mexicans," by Zelia Nuttall; "The Study of Ceremony," by Washington Matthews; "Koroshaniti: A Latter-day Cult," by Anita N. McGee; "The Serpent Symbol in Nicaragua and Yucatan" and "Comparison of Cherokee and European Symbolism," by Stephen D. Peet; "Origin of the Week and Holy Day among Primi-

tive Peoples," by Robert J. Floody; "Surveys of Ancient Cities in Mexico," by William H. Holmes; "An Ancient Figure of Terra Cotta from the Valley of Mexico," by Marshall H. Saville.

On the afternoon of Aug. 11 this section met in joint session with Section E, when the following papers were read and discussed: "The Geographical Distribution of a Certain Kind of Pottery in Mexico and Central America," by Marshall H. Saville; "Early Man of the Delaware Valley," by Frederick W. Putnam; "On the Implement-bearing Sand Deposits at Trenton, N. J.," by H. B. Kummel; "Discussion of the Relics from the Sand Deposits on the Lator Farm," by George F. Wright; "Archaeological Researches in the Trenton Gravels," by William H. Holmes; "Report of an Examination of the Trenches dug on the Lator Farm, July 25-29," by Henry C. Mercer; "Investigation in the Land Deposits of the Lator Field," by Thomas Wilson; "Geologic Age of the Relic-bearing Deposits at Trenton, N. J.," by Rollin D. Salisbury; and "Genesis of Implement Making," by Frank H. Cushing.

1. Economic Science and Statistics.—The presiding officer of this section was Richard T. Colburn, of Elizabeth, N. J., who chose as the subject of his address "Improvident Civilization." At the outset he said: "When we speak of value, equivalency, wealth, risk, trust, distrust, panic, prosperity, we are dealing not with concrete substances like gold pieces, but with states of mind; yet these ideas lie at the foundation of commercial exchanges and monetary science. Have any of you ever imagined what would happen if some modern Rosicrucian should succeed in the turning of base metals cheaply into gold? No one can maintain that this is impossible." Then describing the conditions that would be likely to ensue and making the fact very clear that the present monetary standard was by no manner of means a fixed one, he asked the question, "Shall we have to wait for such an accident for the settlement of a monetary system?" "Our present civilization," he said, "is apt to be lopsided; its contour is asymmetrical; it is not abreast of the knowledge of the time, and is not yielding to mankind nearly the amount of comfort and well-being it might be made to do. From a great number of social ills and shortcomings, due chiefly to this overlapping of the race upon its adult stages, I select a few of the more serious, which will require many centuries to correct themselves in order to raise the inquiry among you whether it is not within the compass of human endeavor to accelerate a better state, not merely to gratify an altruistic impulse, nor yet in fulfillment of ethical ideals, but as a deliberate choice of diverging policies." The waste of war and constant preparation for war was cited as "a malign heritage that has haunted mankind as far back as can be traced." Continuing, he said: "The abstraction of numbers by warfare and privations of army life do not account for the decline and degradation of the great empires of the past. Is there a natural term of life for races, as for individuals—a cycle of growth, maturity, and senility?" He contended that there was a well-founded suspicion that what is now happening to France will, in due time, happen to other nations from the same causes. "Is the fate of Rome, Carthage, Venice, Thebes to be repeated?" The subjects of pernicious competition, spendthrift, luxury, the blight of parasitism, and the rôle of superstitions were discussed at length. In closing, he said: "The decay of faith and the crumbling of dogma, already giving anxiety to thoughtful men within the ecclesiastical pale, is giving rise to the question, 'What is to become of morality when its supernatural sanction is lost?'"

The following-named papers were read and discussed before the section: "Civil-Service Reform: (1) Conflict with the Spoil System in the State of New York; (2) Relation of the System to the Question of the State and Municipal Ownership of Quasi-Public Works," by William H. Hale; "The Economic Position of Women" and "The Competition of Gratuitous Workers," by Mary Forster; "Labor Restrictions as Potent Factors in Social Evolution," by Charles P. Hart; "Racial Determination: The Increase of Suicide," by Lawrence Irwell; "Wheat Consumption in the United States," by Henry Farquhar; "The True Meaning of the Sugar Schedule of the New Tariff," by Harvey W. Wiley; "The United States Idea of Laying out the Public Lands and the Evils resulting therefrom," by Bolton W. DeCourcy; "Contributions to the Development of Meteorology by the Smithsonian Institution," by Marcus Benjamin; "The Promotion of Agricultural Science," by I. P. Roberts; "Weights of Bees, and the Loads they carry," by Charles P. Gillette; "Annual Growth of Forest Trees," by William R. Lazenby; "The Municipal System of Ontario," by Charles C. James; and "A Note on the Silver Question," by Archibald Blue.

Popular Features.—Subsequent to the delivery of the presidential address on the evening of Aug. 9, an informal reception was given by the citizens of Detroit in the rooms of the Central High School, and on Aug. 13 a social reunion and reception was given by the Ladies' Reception Committee. Special excursions were made by the chemical section to the works of Frederick Stearns & Co. and Parke, Davis & Co., on Aug. 11, and by the botanical section to the hothouses of Thomas Berry at Grosse Pointe on Aug. 12, while also on Aug. 12 a large delegation of the association visited the water-works in response to a special invitation sent them by the commissioners. For each of these excursions special cars were provided and the visitors were entertained with refreshments. The great excursion of the meeting was made on Aug. 14, when the local committee provided a steamboat and conducted the association on a water trip through the United States Ship Canal in Lake St. Claire Flats, and through the many islets which have been reclaimed from the shallows of that body of water.

Affiliated Organizations.—Other scientific associations, taking advantage of the gathering of so many members at the meeting of the American Association, have adopted the practice of holding meetings at the same place, and contemporaneous with the American Association, but at such hours as not to interfere with the regular sessions of the larger body. The fifteenth general meeting of the American Chemical Society was held in Detroit on Aug. 9 and 10 under the presidency of Charles B. Dudley, of Altoona, Pa., and with Albert C. Hale, of Brooklyn, N. Y., as secretary. Its meetings were held in joint session with the chemical section of the American Association, and during the days mentioned its president presided, while later the president of the chemical section filled the chair. The regular annual meeting of the Society for the Promotion of Agricultural Science was held on Aug. 10 and 11. Its president was William R. Lazenby, of Columbus, Ohio, and he was succeeded by Byron Halstead, of New Brunswick, N. J., while Charles S. Plumb, of Lafayette, Ind., was continued as secretary. The ninth summer meeting of the Geological Society of America was held on Aug. 10 and 11, under the presidency of Edward Orton, of Columbus, Ohio, and with Herman L. Fairchild, of Rochester, N. Y., as secretary. Like the Chemical Society, it met in joint session with Section E of the association. The Association of Economic Entomologists held its ninth annual meeting in the

Central High School on Aug. 12 and 13, under the presidency of Francis M. Webster, of Worcester, Ohio, and with Charles L. Marlatt, of Washington city, as its secretary. Herbert Osborn, of Ames, Iowa, was elected to the presidency for the ensuing year, and Mr. Marlatt continued in his office as secretary-treasurer. The Society for the Promotion of Engineering Education and the American Mathematical Society met in Toronto during the meeting of the British Association. As usual, during the meeting the Botanical Club of the association held regular meetings, with Samuel M. Tracy, of Agricultural College, Miss., as president and Edward S. Burgess, of New York city, as secretary.

Final Sessions.—The final sessions of the association were held on Aug. 13. At the morning session the time and place of the next meeting as proposed by the council, together with the list of officers nominated by the council, were duly accepted by the association, while at the evening session the usual "thanksgiving" meeting was held, at which the votes of recognition to the local authorities and others were passed. The more important business transacted consisted of a series of amendments to the constitution by means of which the power of the council was considerably extended and also the selection of officers with the naming of the place of meeting was given over entirely to the nominating committee. Section II, on anthropology, was granted permission to hold a winter meeting, and the council recommended to the association the movement to raise funds for a statue of Galileo Ferraris. A grant of \$100 from the research fund was made to the marine biological laboratory, Woods Holl. Committees to extend the influence of the association into the secondary schools and to secure uniform nomenclature in scientific terms used in commerce, were appointed.

The meeting was a small one as far as members were concerned, only 291 persons registering, but the success of the event was largely enhanced by the presence of numerous scientists who came to attend the meeting of the British Association. There were 136 persons elected to membership and 50 persons advanced to the grade of fellowship.

The Next Meeting.—The association will celebrate in 1897 the fiftieth anniversary of its foundation, and it was recommended by the council to meet on that occasion in Boston, as that city was the place where in 1847 it was decided to reorganize the American Association of Geologists and Naturalists as the American Association for the Advancement of Science at the meeting to be held in 1848. The date named for the meeting is Aug. 22, 1898. The following officers were chosen: President, Frederic W. Putnam, Harvard University, Cambridge, Mass. Vice-presidents of sections: A, Mathematics and Astronomy, Edward E. Barnard, Yerkes Observatory, Chicago, Ill.; B, Physics, Frank P. Whitman, Adelbert College, Cleveland, Ohio; C, Chemistry, Edgar F. Smith, University of Pennsylvania, Philadelphia, Pa.; D, Mechanical Science and Engineering, Mortimer E. Cooley, University of Michigan, Ann Arbor, Mich.; E, Geology and Geography, Herman L. Fairchild, University of Rochester, Rochester, N. Y.; F, Zoology, Alpheus S. Packard, Brown University, Providence, R. I.; G, Botany, William G. Farlow, Harvard University, Cambridge, Mass.; H, Anthropology, J. McKeen Cattell, Columbia University, New York city; I, Economic Science and Statistics, Archibald Blue, Director of Bureau of Mines, Toronto, Canada. Permanent secretary, Leland O. Howard, Department of Agriculture, Washington city. General secretary, David S. Kellicott, Ohio State University, Columbus, Ohio. Secretary of the council, Frederick Bedell, Cornell University, Ithaca, N. Y. Secretaries of the sec-

tions: A, Alexander Ziwet, University of Michigan, Ann Arbor, Mich.; B, Edward B. Rosa, Wesleyan University, Middletown, Conn.; C, Charles Baskerville, University of North Carolina, Chapel Hill, N. C.; D, William S. Aldrich, University of West Virginia, Morgantown, W. Va.; E, Warren Upham, St. Paul, Minn.; F, Charles W. Stiles, Department of Agriculture, Washington city; G, Erwin F. Smith, Department of Agriculture, Washington city; H, Marshall H. Saville, American Museum of Natural History, New York city; I, Marcus Benjamin, United States Natural Museum, Washington city. Treasurer, Robert S. Woodward, Columbia University, New York city.

British.—The sixty-seventh annual meeting of the British Association for the Advancement of Science was held in Toronto, Canada, Aug. 18-25. The officers of the association were: President, Sir John Evans. Presidents of sections: A, Mathematics and Physics, A. R. Forsyth; B, Chemistry, William Ramsay; C, Geology, George M. Dawson; D, Zoology, Louis C. Miall; E, Geography, J. Scott

SIR JOHN EVANS.

Keltie; F, Economic Science and Statistics, E. C. K. Conners; G, Mechanical Science, George F. Deacon; H, Anthropology, Sir William Turner; I, Physiology, Michael Foster; K, Botany, H. Marshall Ward. General secretaries, A. G. Vernon Harcourt and E. A. Schaefer, but owing to the absence of the latter W. C. Roberts-Austen filled his place. General treasurer, Arthur W. Rucker.

General Meeting.—The association began its proceedings with a meeting of the general committee on Aug. 18. In the absence of Lord Lister, the chair was taken by Sir John Evans, the president-elect. The report of the council was presented by Prof. W. C. Roberts-Austen, who acted as general secretary. It contained a recommendation nominating Sir Donald Smith, High Commissioner for the Dominion of Canada, the Hon. Arthur Sturgis Hardy, Premier of the Province of Ontario, and the Mayor of Toronto, vice-presidents of the association. The council was informed by Mr. Vernon Harcourt that he did not intend to offer himself for re-election as general secretary. He had held the office of general secretary for fourteen years, and the council expressed their sense of the invaluable services which he had constantly rendered to the association during that period, and recom-

mended that Prof. Roberts-Austen be appointed in succession to Mr. Harcourt. Prof. Schaefer having informed the council that it would be inconvenient for him to attend the meeting at Toronto, they requested Prof. Roberts-Austen to undertake the duties of general secretary during the meeting in his place.

The council elected the following foreign men of science, who have attended meetings of the association, to be corresponding members: Dr. F. Kohlrausch, of Berlin; Dr. van Rijkevorsel, of Rotterdam; and Prof. E. Zackarias, of Hamburg.

It was reported that in accordance with the instructions of the council, a committee waited upon Lord Salisbury and brought before him the question of the establishment of a national physical laboratory. Recently it had been learned that the treasury had appointed a committee to consider and report upon the desirability of establishing a national physical laboratory for the testing and verification of instruments for physical investigation, for the construction and preservation of standards of measurements, and for the systematic determination of physical constants and numerical "data" useful for scientific and industrial purposes, and to report whether the work of such an institution, if established, could be associated with any testing or standardizing work already performed wholly or partly at the public cost.

The following resolution was referred to the council: That it is of urgent importance to press upon the Government the necessity of establishing a bureau of ethnology for Greater Britain, which, by collecting information with regard to the native races within and on the borders of the empire, will prove of immense value to science and to the Government itself. The question was referred to a committee, who reported at some length upon it, and the council then resolved to ask the trustees of the British Museum to allow the proposed bureau to be established in connection with the museum.

The treasurer reported that the receipts of the years 1896-'97 had been £5,341, and the payments £2,945. The amount in the hands of the general treasurer was £2,396. He explained that the balance in his hands was larger than usual, owing to the fact that the meeting in Liverpool last year was a large and successful one. The expenses of the Liverpool meeting were slightly above those of the previous year, being £157, as against £148 for 1895-'96.

In the evening the association met in Massey Hall to hear the inaugural address. Lord Lister presented his successor, with the following words:

"My task on the present occasion is to hand over the presidential position of this association to one eminently deserving of it; a man who has won world-wide distinction as a geologist and an antiquarian, while his many-sided gifts and his genial nature have aroused the admiration and affection of all who have the privilege of his acquaintance."

Inaugural Address of the President.—Sir John Evans chose as the subject of his address "The Antiquity of Man." In opening he said: "Once more has the Dominion of Canada invited the British Association for the Advancement of Science to hold one of the annual meetings of its members within the Canadian territory, and for a second time has the association had the honor and pleasure of accepting the proffered hospitality. In doing so, the association has felt that if by any possibility the scientific welfare of a locality is promoted by its being the scene of such a meeting, the claims should be fully recognized of those who, though not dwelling in the British Isles, are still inhabitants of that Greater Britain whose prosperity is so intimately connected with the fortunes

of the mother country." He referred to the presence of the scientists from the United States as follows: "Our gathering this year presents a feature of entire novelty and extreme interest, inasmuch as the sister association of the United States of America—still mourning the loss of her illustrious president, Prof. Cope—and some other learned societies, have made special arrangements to allow of their members coming here to join us. I need hardly say how welcome their presence is, nor how gladly we look forward to their taking part in our discussions and aiding us by interchange of thought. To such a meeting the term 'international' seems almost misapplied. It may rather be described as a family gathering, in which our relatives more or less distant in blood, but still intimately connected with us by language, literature, and habits of thought, have spontaneously arranged to take part." Then, turning to the subject of his address, he said: "It appears to me, therefore, that my election to this important post may, in the main, be regarded as a recognition by this association of the value of archaeology as a science. It will perhaps be expected of me that I should on the present occasion bring under review the state of our present knowledge with regard to the antiquity of man; and probably no fitter place could be found for the discussion of such a topic than the adopted home of my venerated friend, the late Sir Daniel Wilson, who first introduced the word 'prehistoric' into the English language." Concerning palæolithic man, he said: "When we return to palæolithic man, it is satisfactory to feel that we are treading on comparatively secure ground, and that the discoveries of the last forty years in Britain alone enable us to a great extent to reconstitute his history. We may not know the exact geological period when first he settled in the British area, but we have good evidence that he occupied it at a time when the configuration of the surface was entirely different from what it is at present: when the river valleys had not been cut down to anything like their existing depth, when the fauna of the country was of a totally different character from that of the present day, when the extension of the southern part of the island seaward was in places such that the land was continuous with that of the continent, and when in all probability a far more rainy climate prevailed. We have proofs of the occupation of the country by man during the long lapse of time that was necessary for the excavation of the river valleys. We have found the old floors on which his habitations were fixed; we have been able to trace him at work on the manufacture of flint instruments, and by building up the one upon the other the flakes struck off by the primeval workman in those remote times we have been able to reconstruct the blocks of flint which served as his material." After discussing the arguments concerning the existence of palæolithic man in Great Britain, he referred to the discoveries in France, and then crossed the European Continent and spoke of the finds in the valley of the Euphrates, saying: "May we not from these data attempt in some degree to build up and reconstruct the early history of the human family? There, in eastern Asia, in a tropical climate, with the means of subsistence readily at hand, may we not picture to ourselves our earliest ancestors gradually developing from a lowly origin, acquiring a taste for hunting, if not, indeed, being driven to protect themselves from the beasts around them, and evolving the more complicated forms of tools or weapons from the simpler flakes which had previously served them as knives? May we not imagine that, when once the stage of civilization denoted by these palæolithic implements had been reached, the game for the hunter became

scarcer, and that his life in consequence assumed a more nomad character? Then, and possibly not till then, may a series of migrations to 'fresh woods and pastures new' not unnaturally have ensued, and these following the usual course of 'westward toward the setting sun' might eventually lead to a palaeolithic population finding its way to the extreme borders of western Europe, where we find such enormous traces of its presence."

Proceedings of the Sections. A. Mathematics and Physics.—This section was presided over by Prof. A. R. Forsyth, who fills the Salerian chair of Pure Mathematics in the University of Cambridge. His address consisted of a plea for the unrestricted cultivation of pure mathematics as a science, which he contended was desirable in itself and for its own sake. At the outset the speaker referred to the steps that had been taken by the British Government toward the establishment of a national physical laboratory. He summed up his arguments as follows: "I have tried to show that, in order to secure the greatest benefit for those practical or pure sciences which use mathematical results or methods, a deeper source of possible advantage can be obtained by developing the subject independently than by keeping the attention fixed chiefly upon the applications that may be made. Even if no more were said, it might be conceded that the unrestricted study of mathematics would thereby be justified. But there is another side to this discussion, and it is my wish now to speak very briefly from the point of view of the subject itself, steadily growing and full of increasing vitality. Unless some account be taken of this position, an adequate estimate of the subject can not be framed; in fact, nearly the greater part of it will thus be omitted from consideration. For it is not too much to say that, while many of the most important developments have not been brought into practical application, yet they are as truly real contributions to human knowledge as are the disinterested developments of any other of the branches included in the scope of pure science. It will readily be conceded for the present purpose that knowledge is good in and by itself, and that the pursuit of pure knowledge is an occupation worthy of the greatest efforts which the human intellect can make. A refusal to concede so much would, in effect, be a condemnation of one of the cherished ideals of our race. But the mere pursuit or the mere assiduous accumulation of knowledge is not the chief object; the chief object is to possess it sifted and rationalized—in fact, organized into truth. To achieve this end, instruments are requisite that may deal with the respective well-defined groups of knowledge, and for one particular group we use the various sciences. There is no doubt that in this sense mathematics is a great instrument."

This section, owing to the large number of papers presented before it, divided itself at times into subsections, as follow: On meteorology, on electricity, and on general physics.

Among the more important papers presented before this section were the following: "On the Unification of Time," by J. A. Patterson; "On a Photographic Record of Objective Combination Tones," by Arthur W. Rucker, R. Forsyth, and R. Sower; "On the Determination of the Surface Tensions of Water and of Certain Dilute Aqueous Solutions by Means of the Method of Ripples," by N. E. Dorsey; "On a New Method of determining the Specific Heat of a Liquid in Terms of the International Electric Units," by H. L. Callendar; "On the Behavior of Argon in X-Ray Tubes," by H. L. Callendar and N. N. Evans; "On the Fuel Supply and Air Supply of the World," by Lord

Kelvin; "A Canadian and Imperial Hydrographic Survey," by A. Johnson; "On the Specific Heat of Superheated Steam," by Prof. Ewing and Stanley Dunkerley; "New Varieties of Cathode Rays," "An Experiment with a Bundle of Glass Plates," and "A Tangent Photometer," by S. P. Thompson; "On the Spectra of Oxygen, Sulphur, and Selenium," by C. Runge and F. Paschen; "The Influence of Pressure on Spectral Lines," by J. Larmor; "Changes in the Wave Frequencies of the Lines of Emission Spectra of Elements," by W. J. Humphreys; "On the Constitution of the Electric Spark," by Arthur Schuster; "A Reduction of Rowland's Value of the Mechanical Equivalent of Heat to the Paris Hydrogen Scale," by W. S. Day; "A Comparison of Rowland's Mercury Thermometer with a Griffiths's Platinum Thermometer," by F. Mallory and C. W. Wadner; "Monthly and Annual Rainfalls in the British Empire, 1877 to 1896," by John Hopkinson; "On the Temperature of Europe," by Van Rijkevorsel; "The Climatology of Canada," by R. F. Stupart; "The Great Lakes as a Sensitive Barometer," by P. Napier Denison; "Slow Refrigeration of the Chinese Climate," by J. Elkins; "Progress of the Exploration of the Air with Kites," by A. L. Rotch; "Meteorites, Solid and Gelatinous," by Otto Huhn; "November Meteors and November Flood Traditions," by R. G. Haliburton; "On the Solution of the Cubic Equation," by Alexander Macfarlane; "The Historical Development of the Abelian Functions," by Harris Hancock; "On a Notation in Vector Analysis," by O. Henriel; "New Harmonic Analyses," by Albert A. Michelson and S. W. Stratton; "The Multipartite Partitions of Numbers which possess Symmetrical Graphs in Three Dimensions," by P. A. MacMahon; "Kites for Meteorological Uses," by C. F. Marvin; "The Quinquection of the Cyclicomic Equation," by J. Larmor; "Increase of Segmental Vibrations in Aluminium Violins," by Alfred Springer; "Demonstrations on the Form of Alternating Currents," by Prof. Braun; "Note on an Electrical Oscillator," by Nicola Tesla; "An Electric Curve Tracer," by Edward B. Rosa; "On the Use of the Interferometer in the Study of Electric Waves," by G. F. Hull; "Oscillographs," by W. D. B. Duddell; "On the Calculation of the Coefficient of Mutual Induction of a Circle and a Co-axial Helix," by J. V. Jones; "On a Determination of the Ohm made in testing the Lorenz Apparatus of the McGill University," by W. E. Ayrton and J. V. Jones; "The Relations between Arc Curves and Crater Ratios with Cored Positive Carbons," by Mrs. Ayrton; "On the Source of Luminosity in the Electric Arc," by Henry Crew and O. H. Basquin; "On Some New Forms of Gas Batteries and a New Carbon-Consuming Battery," by Willard E. Case; "On the Determination of the State of Ionization in Dilute Aqueous Solutions containing Two Electrolytes," by J. G. MacGregor; "An Apparatus for verifying the Law of Conservation of Energy in the Human Body," by Wilbur O. Atwater and Edward B. Rosa; "The Rate of Decrease of the Intensity of Shril Sounds with Time," by A. W. Duff; "A New Instrument for measuring the Intensity of Sound," by A. G. Webster and B. F. Sharpe; "Atmosphere in its Effects on Astronomical Observation," by Percival Lowell; "Automatic Operations of Eclipse Instruments," by David P. Todd; "The Cause of the Semiannual Inversions of the Type Solar Curve in the Terrestrial Magnetic Field" and "Observations at Toronto with Magnet Watch Integrator," by Frank H. Bigelow; "The Yerkes Observatory," by George E. Hale; "The Effects of Tension and Quality of the Metal upon the Changes in Length produced in Iron Wires by Magnetization," by B.

B. Brackett: "On the Susceptibility of Diamagnetic and Weakly Magnetic Substances," by A. P. Wills; "On Magnetic Periodicity as connected with Solar Physics," by Arthur Harvey; "On the Refractivity of Mixtures of Gases," by William Ramsay; "On the Use of the Trifilar Suspension in Physical Apparatus," by Sylvanus P. Thompson; "On Zeeman's Discovery of the Effects of Magnetism on Spectral Lines," by Oliver Lodge; "On the Use of Constant Total Current Shunt with Ballistic Galvanometers," "The Sensibility of Galvanometers," "Short versus Long Period Galvanometers for very Sensitive Zero Tests," by W. E. Ayton and J. Mather; "On a Research in Thermoelectricity by means of a Platinum Resistance Pyrometer," by H. M. Tory; "On a Simple Modification of the Board of Trade Form of the Standard Clark Cell," by H. L. Callendar and H. T. Barnes; "On the Cyclical Variation with Temperature of the E. M. F. of the H. Form of Clark's Cell," by F. S. Spiers, F. Twyman, and W. L. Waters; "On the Disruptive Discharge in Air and Dielectric Liquids," by J. W. Edmondson.

Also the following reports of committees were received and discussed: "On Seismological Observations," "On the Present State of our Knowledge in Electrolysis and Electric Chemistry," "On the Application of Photography to the Elucidation of Meteorological Phenomena," "On Tables of Certain Mathematical Functions," "On Observations at the Ben Nevis Observatory," and "On Electrical Standards."

B. Chemistry.—The opening address before this section was delivered by Prof. William Ramsay, one of the discoverers of the element argon and Professor of Chemistry in University College, London.

The subject of his address was "An Undiscovered Gas." He said: "I shall describe to you later its curious properties, but it would be unfair to put you at once in possession of the knowledge of its most remarkable property—it has not yet been discovered. As it is still unborn, it has not been named. The naming of a new element is no easy matter. For there are only 26 letters in our alphabet, and there are already over 70 elements. To select a name expressible by a symbol which has not already been claimed for one of the known elements is difficult, and the difficulty is enhanced when it is at the same time required to select a name which shall be descriptive of the properties (or want of properties) of the element." After describing how as long ago as 1817 Dobereiner showed that certain elements could be arranged in groups of 3, and also how later Mendeleeff showed similarly that the elements grouped themselves in certain well-arranged classes, Prof. Ramsay went on to say that subsequent to the discovery of argon and helium he was led to suspect the presence of another element. He pointed out several conditions in his experimental work on argon and helium that could be only explained by the presence of another element. "There should, therefore, be an undiscovered element between helium and argon, with an atomic weight 16 units higher than that of helium and 20 units lower than that of argon—namely, 20. And if this unknown element, like helium and argon, should prove to consist of monatomic molecules, then its density should be half its atomic weight, 10. And pushing the analogy still further, it is to be expected that this element should be as indifferent to union with other elements as the two allied elements."

Among the more important papers read before this section were the following: "Reform in the Teaching of Chemistry," by W. W. Andrews; "On Helium" and "Demonstration of the Spectra of

Helium and Argon," by William Ramsay; "Contributions to the Chemistry of the Rare Earth Metals" and "The Atomic Weight of Thorium," by B. Brauner; "The Atomic Weights of Cobalt and Nickel," by T. W. Richards; "The Occurrence of Hydrogen in Minerals," by M. Travers; "Spectroscopic Examination of Minerals and Metals," by W. N. Hartley and H. Ramage; "Demonstration of the Preparation and Properties of Fluorine," by M. Meslans; "The Properties of Liquid Fluorine," by M. Moissan and J. Dewar; "The Permeability of Elements of Low Atomic Weight to the Röntgen Rays" and "Notes on Concentrated Solutions of Lithium and Other Salts," by J. Waddell; "Continuation of Experiments on Chemical Constitution and the Absorption of X-Rays," by J. H. Gladstone and W. Hibbert; "On the Action exerted by Certain Metals on a Photographic Plate," by W. J. Russell; "Photographs of Explosion Flames," by Harold B. Dixon; "Titanic Oxide" and "Deliquescence and Efflorescence of Certain Salts," by F. P. Dunnington; "The Formation of Crystals," by W. L. T. Addison; "A Compound of Ozone and Mercury," by E. C. C. Baly; "The Interaction of Hydrobromic and Bromic Acids," by J. W. Walker; "The Composition of Canadian Virgin Soils," by F. T. Shutt; "Analysis of Some Pre-Carboniferous Coals," by W. H. Ellis; "The Constitution of Aliphatic Ketones," by Paul C. Freer; "The Chemistry of Methylene," by John U. Nef; "Formation of a Benzene Ring by Reduction," by A. Lehmann; "Condensation Products of Aldehydes and Amides," by C. A. Kohn; "A New Form of Bunsen Burner," by Hugh Marshall; "Molecular Movement in Metals," by W. C. Roberts-Austen; "The Causes of Loss incurred in roasting Gold Ores containing Tellurium," by T. K. Rose; "The Behavior of Lead and of Some Lead Compounds toward Sulphur Dioxide," by H. C. Jenkins; "The Vapor Tensions of Liquid Mixtures," by W. L. Miller and T. R. Rosebrough; "The Electrolytic Determination of Copper and Iron in Oysters," by C. A. Kohn; "The Nitro-alcohols," by A. Henri; "The Plaster-of-Paris Method in Blowpipe Analysis," by W. W. Andrews; "Some Experiments with Chlorine," by R. Ransford.

Also the following reports of committees were received and discussed: "On the Teaching of Science in Elementary Schools," "On preparing a New Series of Wave-Length Tables of the Spectra of the Elements," "On the Proximate Chemical Constituents of the Various Kinds of Coal," "On the Isometric Naphthalene Derivatives," "On the Action of Light on Dyed Colors," "On the Electrolytic Methods of Quantitative Analysis," "Isometric Naphthalene Derivatives," "The Direct Formation of Haloids from Pure Materials," "The Bibliography of Spectroscopy," "The Carbohydrates of Barley Straw."

C. Geology.—Dr. George M. Dawson, who is director of the Geological Survey of Canada, presided over this section. His address was on the "Pre-Cambrian Rocks of History." He said: "The nature and relations of the more ancient rocks of North America are problems particularly Canadian, for these rocks in their typical and most easily read development either constitute or border upon the continental protaxis of the north. The questions involved are, however, at the same time perhaps more intimately connected with a certain class of world-wide geological phenomena than any of those relating to later formations, in which a greater degree of differentiation occurred as time advanced. A reasonably satisfactory classification of the crystalline rocks beneath those designated as Palæozoic was first worked out in the Canadian region by Logan and his colleagues—a classification of which the validity was soon after generally recognized.

The greatest known connected area of such rocks is embraced within the borders of Canada, and, if I mistake not, the further understanding of the origin and character of these rocks is likely to depend very largely upon work now in progress or remaining to be accomplished." In order to bring out what may be regarded as established respecting these older rocks, and in what direction the most hopeful outlook exists, Dr. Dawson adopted the historical method of treatment, and recapitulated briefly the first steps made in the classification of the crystalline schists in Canada, reviewing the work and reports of Logan and his colleagues in the Ottawa valley and the north shores of Lake Superior and Lake Huron. He also described with care the modern and chemical methods of research that have been applied to the ancient crystalline schists of Canada, and which have resulted in establishing the fact that a greater part of the Huronian is essentially composed of contemporaneous volcanic material, effusive or fragmental. He discussed the use of the name Archean, and contended that its application was "to include all rocks below the hiatus of which evidence was first found in the Lake Superior region." Of the Laurentian he said that, "It is still appropriately made to include both the Fundamental Gneiss and the Grenville series." He referred to the uncertainty of the beginning of the Palaeozoic rocks, contending that "the base of the Cambrian was a question almost entirely palaeontological." In conclusion, he said: "If all the sedimentary rocks below the Olenellus zone are to pass under one name, let us cling to the venerable name Greywacke. It can do no mischief, while it describes things indefinite, simply because it is without meaning."

Among the more important papers read before this section were the following: "Some Typical Sections in Southwestern Nova Scotia," by L. W. Bailey; "Problems in Quebec Geology," by R. W. Ellis; "The Stratigraphic Succession in Jamaica," by Robert T. Hill; "Preliminary Notice of Some Experiments on the Flow of Rocks," by F. D. Adams and J. T. Nicholson; "The Former Extension of the Appalachians across Mississippi, Louisiana, and Texas," by John C. Branner; "A Group of Hypotheses bearing on Climatic Changes" and "Distribution and Succession of the Pleistocene Ice Sheets of the Northern United States," by Thomas C. Chamberlain; "The Glacial Deposits of the Alps," by A. Penck; "On the Asar of Finland," by Prince Krapotkin; "The Chalky Boulder Clay and the Glacial Phenomena of the Western Midland Counties of England," by H. B. Woodward; "Glacial and Interglacial Deposits at Toronto," by A. P. Coleman; "On the Continental Elevation of the Glacial Epoch," by John W. Spencer; "The Champlain Submergence and Uplift and their Relations to the Great Lakes and Niagara Falls," by F. B. Taylor; "Remarks introductory to the Excursion to Niagara Falls and Gorge," by Grove K. Gilbert; "Drift Phenomena of Puget Sound and their Interpretation," by Bailey Willis; "The Southern Lobe of the Laurentian Ice Sheet," by Charles H. Hitchcock; "On the Origin of Drumlins," by Nathaniel S. Shaler; "The Preglacial Decay of Rocks in Eastern Canada," by R. Chalmers; "Note on Certain Pre-Cambrian and Cambrian Fossils supposed to be related to Eozoon," by William Dawson; "Note on a Dendroid Fish Tooth from Silurian Rocks of Nova Scotia," by J. F. Whiteaves; "On Some New or hitherto Little-known Palaeozoic Formations in Northeastern America," by H. M. Ami; "Palaeozoic Geography of the Eastern States," by Edward W. Claypole; "Some Characteristic Genera of the Cambrian," by G. F. Matthew; "Influence d'un éboulement sur le régime d'une rivière," by J. C. K. La-

flamme; "On the Relations and Structure of Certain Granites and Associated Arkoses on Lake Temiscaming, Canada," by A. E. Barlow and W. F. Frier; "On Some Nickeliferous Magnetites," by W. G. Miller; "Differentiation in Igneous Magmas as a Result of Progressive Crystallization," by J. J. H. Teall; "The Glaciation of North Central Canada," by J. B. Tyrrell; "The Geological Horizon of Some Nova Scotia Minerals," by E. Gulpin, Jr.; "On the Possible Identity of Bennettsia, Williamsosmia, and Zamites Gigas," by A. C. Seward; "Glacial Geology of Western New York," by H. LeRoy Fairchild; "Earth Strains and Structure," by O. H. Howarth; "On the Structure and Origin of Certain Rocks of the Laurentian System," by F. D. Adams.

Also the following reports of committees were received and discussed: "On Life Zones in the British Carboniferous Rocks," "For the Investigation of a Coral Reef," "On the Fossil Phyllozoa of the Palaeozoic Rocks," "On the Secondary Fossils of Moresat, Aberdeenshire," "On the Coast Erosion of the East Kent and Dover Natural History Societies," "On the Fauna of Caves near Singapore," "On Seismological Investigation," "On collecting Photographs of Geological Interest."

On Aug. 25 a joint session was held with Section II, when a discussion was held on "The First Traces of Man in America."

D. Zoology.—This section was presided over by Prof. C. Miall, who fills the chair of Biology in the Yorkshire College, Leeds. Prof. Miall spoke on "The Transformation of Animals." At the outset he referred to the importance of the study of zoology as tending to enlarge our sense of the possibilities of life. Prof. Miall then took up the question of animal transformation and the reasons therefore, discussing at considerable length the history of the life of the eel, which for many years was involved in obscurity. His conclusions were that "the general rule which connects the presence or absence of transformation with habitat is well founded, but that it is apt to be modified, and even reversed by highly special circumstances. The effects of habitat may, for instance, be overruled by parasitism, parental care, a high degree of organization, or even by a particular trick in egg laying. The direct action of the medium is probably of little consequence. Thus the difference between fresh and salt water is chiefly important because it prevents most species from passing suddenly from one to the other. But the abyssal and the fluviatile faunas have much in common, and also have the littoral and the pelagic faunas. Relative density and continuity of population seem to be of vital importance, and it is chiefly these that act upon the life history." The balance of the address was devoted to a discussion of alternation of generations and kindred subjects, largely of a technical character. In conclusion he said: "This hasty review of animal transformation reminds me how great is the part of adaptation in Nature. To many naturalists the study of adaptation is the popular and superficial side of things; that which they take to be truly scientific is some kind of index making. But we should recognize that comparatively modern adaptations may be of vital importance to the species, and particularly luminous to the student, because at times they show us Nature at work."

Among the more important papers read before this section were the following: "The Naples Marine Station and its Work," by Anton Dohrn; "On a Proposed Lacustrine Biological Station," by R. Ramsay Wright; "The Origin of Vertebrata," by Charles S. Minot; "On a Restoration and Phenacodus Primævus," "On Skeletons and Restorations of Tertiary Mammalia," and "The Origin of Mammalia," by Henry F. Osborn; "Oysters and the

Oyster Question," by W. A. Herdman; "The Blind Fishes of America," by Carl H. Eigenmann; "Description of Specimens of Sea Trout, Capelin, and Sturgeon from Hudson Bay" and "The Esocidae of Canada, with Description of a New Species of Pike found in Ontario," by E. E. Prince; "Recent Additions to the Fish Fauna of New Brunswick," by Philip Cox; "Theories of Mimicry as illustrated by African Butterflies" and "Mimicry as Evidence of the Truth of Natural Selection," by E. B. Poulton; "On the Surface Plankton of the North Atlantic," by W. Garstang; "Remarks on Branchipus stagnalis," by A. Halkett; "Economic Entomology in America," by Leland O. Howard; "On New Sepiada from the Lower Cretaceous of the South Saskatchewan," by J. F. Whiteaves; "On the Statistics of Bees," by F. Y. Edgeworth; "The Appearance of the Army Worm in Ontario during the Summer of 1896," by J. Hayes Panton; "On a Supposed New Insect Structure," by Louis C. Miall; "On Recapitulation in Development, as illustrated by the Life History of the Masked Crab (Corystes)," by M. W. Garstang; "On Musculo-glandular Cells in Annelids," by Gustave Gilson; "On the Plankton collected continuously during a Traverse of the Atlantic," by W. A. Herdman; "The Determinants for the Major Classification of Fishlike Vertebrates" and "On the Derivation of the Pectoral Member in Terrestrial Vertebrates," by Theodore Gill; "The Morphological Significance of the Comparative Study of Cardiac Nerves," by W. H. Gaskell; "Observations upon the Morphology of the Cerebral Commissures in the Vertebrata," by G. Elliot Smith; "Some Points in the Symmetry of Actinians," by J. P. McMurich; "The Natural History of the Instinct," by C. Lloyd Morgan; "On the Hematozoön Infections of Birds," by W. G. McCallum; "The Post-embryonic Development of Aspidogaster Conchicola," by J. Stafford; "On a particularly Large Set of Antlers of the Red Deer (Cervus elaphus), with Photographic Illustrations" and "On the Evolution of the Domestic Races of Cattle with Particular Reference to the History of the Durham Shorthorn," by G. P. Hughes.

Also the following reports of committees were received and discussed: "The Naples Zoölogical Station," "Marine Biological Laboratory, Plymouth," "Zoölogical Bibliography and Publication," "Index Generum et Specierum Animalium," "Zoölogy and Botany of the West Indian Islands," "Migration of Birds," "The African Lake Fauna," "The Zoölogy of the Sandwich Islands," and "The Biology of Oceanic Islands."

E. Geography.—This section was presided over by Dr. J. Scott Keltie, well known as the editor of the "Statesman's Yearbook," and as the secretary of the Royal Geographical Society. The subject of Dr. Keltie's address was on "Exploration and Geographical Research." He referred to the progress made in geography during the past sixty years, and said: "The great continent of Africa has practically been discovered, for sixty years ago almost all but its rim was a blank. In 1837 enormous areas in North America were unexplored, and much of the interior of South America was unknown. In all parts of Asia vast additions have been made to our knowledge; the maps of the interior of that continent were sixty years ago of the most diagrammatic character. The Australian interior was nearly as great a blank as that of Africa; New Zealand had not even been annexed. Need I remind you of the great progress which has been made during the period both in the north and south polar areas, culminating in the magnificent achievements of Dr. Nansen? It was just sixty years ago that the great antarctic expedition under Sir James Ross was being organized; since that, alas, little or nothing has been

done to follow up his work. Sixty years ago the science of oceanography, even the term, did not exist: it is the creation of the Victorian era, and may be said almost to have had its origin in the voyage of the "Challenger," which added a new domain to our science and opened up inexhaustible fields of research." Mr. Keltie then discussed the functions and field of geography, and indicated ways in which geographical research might be profitably carried on in Great Britain and on the European Continent. He also referred to what remained to be done in the way of explaining the unknown or little-known regions of the globe. Of Asia, he said, the most important *desiderata* so far as pioneer exploration is concerned, is southern and central Arabia and Tibet. The forbidden city of Lhasa was referred to as the goal of several adventurers. In Africa he called attention to the fact that to the south of Abyssinia and to the north-west of Lake Rudolf, on the upper Nile, is a region of considerable extent which is still practically unknown. After speaking of the excellent work done by the geological surveys of Canada and the United States, he referred to the fact that there "is ample scope for the study of many problems in physical geography—past and present glaciations and the work of glaciers, the origin and régime of lake basins, the erosion of river beds, the oscillation of coast lines." The unexplored regions of Central South America were mentioned, and of South America he said, "There is a wider and richer field for exploration than in any other continent." The conditions in Australia were referred to, and the present status of polar and antarctic exploration fully described. His closing paragraph consisted of a brief summary of the works done in recent years in the new science of oceanography.

Among the more important papers read before this section were the following: "Kafiristan and the Kafirs," by G. S. Robertson; "Novaia Zemlia and its Physical Geography," by E. Delmar Morgan; "Temperature Observations off Spitzbergen," by B. Leigh Smith; "Scientific Geography for Schools," by R. E. Dodge; "Forestry in India," by F. Bailey; "The Classification of Geography," by H. R. Mill; "The Distribution of Detritus by the Sea," by Vaughn Cornish; "On Certain Submarine Changes," by John Milne; "The Congo and the Cape of Good Hope, 1842 to 1888," by Ernest G. Ravenstein; "Institutions engaged in Geographical Work in the United States," by Marcus Baker; "The Hydrography of the United States," by Frank H. Newell; "The Geographical Work of the United States Coast and Geodetic Survey," by Thomas C. Mendenhall; "The Coastal Plain of Maine," by W. Morris Davis; "The Unification of Time at Sea," by C. E. Lumsden; "The Barren Lands of Canada," by J. B. Tyrrell; "The Daily Weather Survey of the United States," by Willis L. Moore; "The Geographical Work of the United States Geological Survey," by Charles D. Walcott; "The Topographical Work of the Canadian Geological Survey," by J. White; "The Economic Geography of Rhodesia," by F. C. Selous; "A Journey in Tripoli," by J. T. Myres; "On the Direction of Lines of Structure in Eurasia," by Prince Krapotkin; "Potamology as a Branch of Geography," by A. Penck; "Geographical Development of the Lower Mississippi," by E. L. Corthell; "Southeastern Alaska: Geography and the Camera," by Otto J. Klotz; "The First Ascent of Mount Lefroy and Mount Aberdeen," by Harold B. Dixon; "Mexico Felix and Mexico Deserta," by O. H. Howarth; "The Material Conditions and Growth of the United States," by Henry Gannett; "Geographical Pictures," by H. R. Mill; "Geographical Wall Pictures," by A. Penck; and "Geography as a University Subject," by W. M. Davis.

Also the following reports of committees were read and discussed upon this section: "On the Climate of Tropical Africa" and "On Geographical Education."

F. Economics and Statistics.—Prof. Edward C. K. Gonner, who is Professor of Political Economy in University College, Liverpool, had been chosen as president of this section; illness, however, prevented him from being present, but he prepared an address on "The Labor Question," which was read by Sir C. W. Fremantle, late deputy master of the mint and a vice-president of the section. In opening, he spoke of the confusion that had arisen in regard to the meaning of the word "labor," which at least in this address would be restricted to "manual labor." He touched upon the change in the method of employment common to all countries, owing to the growth of the system of great industry and the consequent demarcation of those engaged into the classes of employers and employed. After speaking of the purely economic influences which have added prominence to this important separation into the two classes of employers and employed, a very small class of employers and a very large class of employed, the address dwelt upon the other influences which have contributed to this result. Among these was the effect of the franchise, concerning which he said: "It is impossible to underrate its effect as subsidiary in the cause of a change already accomplished and capable of attracting more interest with each fresh access of attention bestowed upon it." To characterize an age is never easy, but at present there are some features so marked and so capable of identification "that one pauses to ask in amazement if the age of the Renaissance had not dawned upon us again in an altered guise." In response to our needs and our circumstances we are seeking a positive moral guidance in an enlarged conception of social duty and solidarity, and the position which employed labor occupies with regard to them is sufficient to insure it attention, and not attention only, but sympathetic attention. In England the imagination of the people has been struck and its feelings stirred with regard to this particular problem, which stands out before other matters sharply marked and conspicuous. Of trade organization he said: "Dependence on wages finds a corrective in the growth of benefit societies and the insurance clauses of trade associations; separation from management and capital has in some instances been stayed by schemes for co-operation and profit sharing, while the greatest defect of all, the weakness of employed labor in competition with the allied and resourceful forces of capital and management, has led to the marvelous organization of trade unions and kindred associations." In closing, he advocated an advance in economic study and the increase in knowledge of the conditions of labor. One of his illustrations in this connection was the following: "Incorrect theories as to taxation led to the separation between England and those colonies which now form the United States of America; unsound economic and social theories lit throughout Europe the cleansing if devouring fires of the French revolution; unsound economic theories threatened to sap the vigor of England in the third and fourth decades of the present century, and, to take a specific instance, embodied themselves in the opposition to factory reform."

Among the more important papers read before this section were the following: "The History and Policy of Trade Combination in Canada," by W. H. Moore; "Recent Aspects of Profit Sharing," by N. P. Gilman; "A Consideration of a European Monopoly as a Contribution to the Theory of State Industries," by S. M. Wickett; "Statistics of Deaf-

mutism in Canada," by G. Johnson; "Some Fallacies in the Theory of the Distribution of Wealth," by Arthur T. Halley; "Canada and the Silver Question," by J. Davidson; "The Origin of the Dollar," by W. G. Sumner; "Silver and Copper in China," by J. Elkins; "Characteristics of Canadian Economic History," by A. Shortt; "Economic History of Canada," by J. Castell Hopkins; "National Policy and International Trade," by Edwin Cannan; "Public Finance, with Special Reference to Canada," by J. L. McDougall; "Crown Revenues in Canada, 1763-1847," by J. A. McLean; "The Evolution of the Metropolis and Problems of Municipal Government," by William H. Hale; "Local Difference in Discount Rates in the United States," by R. M. Breckenridge; "The Conception of Justice in Taxation," by C. C. Plehn; "The Economic Geography of Rhodesia," by F. C. Selous; "Economic Aspects of the Workman's Compensation Bill," by R. Macdonald; "The Relation of the Employment of Women and Children to that of Men," by Carroll D. Wright; "Recent Reaction from Economic Freedom in the United States," by R. R. Bowker; "The Theory of Economic Choices," by Franklin H. Giddings; "Some Economic Notes on Gold Mining in Canada," by Prof. Mavor; and "Theory of Railway Rates," by W. M. Acworth.

G. Mechanical Science.—The presiding officer of this section was George F. Deacon, a well-known civil engineer, who from 1877 to 1897 had charge of the task of supplying the city of Liverpool with a new water supply. His address treated largely of the methods that are and should be adopted in training men to be mechanical engineers. He said: "I shall make no attempt to review the large number of excellent courses which are now available for the teaching of applied science in relation to engineering. Experience of the results as judged by the students who have come directly under my notice, and examination of many calendars, has aroused various thoughts concerning them, and this thought is perhaps uppermost: Are we not in some cases attempting at too early a stage the teaching of subjects instead of principles? Complete subjects, I mean, including the practical working of details, which will become the regular study of the student in office or works of an engineer. It certainly seems to me to be so. I do not say that subject training of this kind at college may not be useful; but we have to consider whether it does not for the sake of some little anticipation of his office work divert the attention of the student from the better mastery of those principles which it is so essential for him to grasp at the earliest possible time, and which do not limit his choice in the battle of life to any branch whatever of the profession or business of an engineer, but which, on the contrary, qualify him better to pursue with success whatever branches his inclination or his opportunities or his means may suggest. There is some danger in the usual limitation of compulsory subjects in examinations for certificates and degrees. When an examination has to be passed subjects not made compulsory are too often entirely neglected, however important to the engineer they may be. At present it too often happens that, unless an engineering student is predestined to practice electrical work of some chemical industry, he begins life as an engineer with no knowledge of the principles of either the one or the other, and chiefly as a result of their neglect for the sake of certain subjects made compulsory for the test he has had to pass, which subjects are not always the more important and too often include perfected details which, I venture to think, can not be rightly mastered in schools. For these reasons it appears to me that a certain very moderate standard in all such sub-

jects should be made compulsory if a certificate of proficiency, whether by degree or otherwise, is to be given in engineering or even in physical science."

Among the more important papers read before this section were the following: "The Soulages Canal, a Typical Link of the 14-Foot Inland Navigation of Canada between Lake Erie and Montreal," by T. Munro; "The Hydraulic Laboratory of McGill University," and "The Strength of Columns," by G. Lanza; "Experiments on the Strength of White Pine, Red Pine, Hemlock, and Spruce," by H. T. Bovey; "A New Apparatus for studying the Rate of Condensation of Steam on a Metal Surface at different Temperatures and Pressures," by H. L. Callendar and H. A. Nicolson; "Tests on the Triple-Expansion Engine at Massachusetts Institute of Technology," by Prof. Peabody; "Montreal Electric Tramway System," by G. C. Cunningham; "Present Tendencies of Electric Tramway Systems in England," by J. G. W. Aldridge; "A New Method of Measuring Hysteresis in Iron," by J. L. W. Gill; "A New Method of investigating the Variation of the Magnetic Qualities of Iron with Temperature," by F. H. Pitcher; "Some Tests on the Variation of the Constants of Electricity Supply Meters with Temperature and with Current," by G. W. D. Riicks; "Roller Bearings," by W. B. Marshall; "Analysis of Speed Trials of Ships," by W. G. Walker; "A Modern Power Gas Plant working a Textile Factory," by H. Allen; "Effect of Temperature in varying the Resistance to Impact, the Hardness, and the Tensile Strength of Metals," by A. Macphail.

Also the following reports were read and discussed before the section: "On Calibration of Instruments in Engineering Laboratories" and "On Small Screw Gauges."

II. Anthropology.—Sir William Turner, who is Professor of Anatomy in the University of Edinburgh, presided over this section. The subject of his address was "Some Distinctive Characters of Human Structure." The distinctive characteristics of man, such as his erect carriage, the peculiarities of his spinal column, and his specialized extremities, were discussed at length and contrasted with similar features in other animals, and especially the apes. The cranial cavity in man was shown to be larger than in any other vertebrate except in the elephant and in the large whales, in which the huge mass of the body demands the great sensory-motor centers in the brain to be large. His closing remarks were: "We know that an animal is guided by its instincts, through which it provides for its individual wants and fulfills its place in Nature. In man, on the other hand, the instinctive acts are under the influence of the reason and intelligence, and it is possible that the association centers, with the intermediate association fibers which connect them with the sensory and motor centers, may be the mechanism through which man is enabled to control his animal instincts, so far as they are dependent on motion and sensation. The higher we ascend in the scale of humanity, the more perfect does this control become, and the more do the instincts, emotions, passions, and appetites become subordinated to the self-conscious principle which regulates our judgments and beliefs. It will therefore now be a matter for scientific inquiry to determine, as far as the anatomical conditions will permit, the proportion which the association centers bear to the other centers both in mammals and in man, the period of development of the association fibers in comparison with that of the motor and sensory fibers in different animals, and, if possible, to obtain a comparison in these respects between the brains of savages and those of men of a high order of intelligence. The capability of erect-

ing the trunk, the power of extending and fixing the hip and knee joints when standing, the stability of the foot, the range and variety of movement of the joints of the upper limb, the balancing of the head on the summit of the spine, the mass and weight of the brain and the perfection of its internal mechanism are distinctively human characters. They are the factors concerned in adapting the body of man, under the guidance of reason, intelligence, the sense of responsibility, and power of self-control, for the discharge of varied and important duties in relation to himself, his Maker, his fellows, the animal world, and the earth on which he lives."

Among the papers read before this section were: "The Scalp Lock: A Study of Omaha Ritual" and "The Import of the Totem among the Omaha," by Alice C. Fletcher; "Sqaktktquacht, or the Benign-Faced, Oannes of the Ntlakapamuq, British Columbia," by C. Hill-Tout; "The Blackfoot Legend of Scar Face" and "Blackfoot Sun Offerings," by R. N. Wilson; "Star Lore of the Micmacs of Nova Scotia," by Stansbury Hagar; "The Lake Village of Glastonbury and its Place among the Lake Dwellings of Europe," by R. Munro; "Some Old-World Harvest Customs," by F. T. Elworthy; "A Demonstration of the Utility of the Spinal Curves in Man," by Anderson Stuart; "The Causes of Brachycephaly" and "Notes on the Brains of Some Australian Natives," by A. Macalister; "On Some Cases of Trepanning in Early American Skulls," by W. J. McGee; "A Case of Trepanning in N. W. Mexico," by Carl Lumholtz and A. Hrdlicka; "An Experimental Analysis of Certain Correlations of Mental and Physical Reactions," by Lightner Witmer; "The Growth of Toronto School Children," by Franz Boas; "The Physical Characteristics of European Colonists born in New Zealand," by H. O. Forbes; "The Seri Indians of the Gulf of California," by W. J. McGee; "Notes Historical and Philological on the Indians of British Columbia," by C. Hill-Tout; "The Kootenays of British Columbia and their Salishan Neighbors" and "Kootenay Indian Drawings," by A. F. Chamberlain; "A Rock Inscription on Great Central Lake, Vancouver Islands," by J. W. MacKay; "Blackfoot Womanhood," by J. Maclean; "On the Hut Burial of the American Aborigines," by E. Sidney Hartland; "The Origin of the French Canadians," by B. Sulte; "The Evolution of the Cart and Irish Car," by A. C. Haddon; "The Jesup Expedition to the North Pacific," by Frederick W. Putnam; "Why Progress is in Leaps," by George Iles; "The Kafirs of Kafiristan," by George Robertson; "The Mangyans and Tagbanas of the Philippine Islands," by Dean C. Worcester; "Exhibition of Lance-Headed Implements of Glass from Northwest Australia," by Sir William Turner; "The Genesis of Implement Making," by Frank H. Cushing; "Adze Making in the Andaman Islands," by A. C. Haddon.

On Aug. 24 there was a discussion before this section on the "Evidences of American Asiatic Contact," and on Aug. 25 a joint session was held with Section C (geology) on "The First Traces of Man in the New World," at which the following papers were read: "The Trenton Gravels," by Frederick W. Putnam, and "Human Relics in the Drift of Ohio," by Edward W. Claypole.

The following reports were read and discussed: "On the North Dravidian and Kolarian Races of Central India," "On the Silchester Excavations," "On the Mental and Physical Deviations in Children from the Normal," "On Anthropometric Measurements in Schools," "On the Northwest Tribes of Canada," "On the Ethnographic Survey of Canada," "On the Ethnographic Survey of the

United Kingdom," and "On the Necessity of the Immediate Investigations of the Anthropology of Oceanic Islands."

1. Physiology.—This section was presided over by Prof. Michael Foster, who since 1893 has been Professor of Physiology in Cambridge, and is well known as the author of several text-books on physiology. His address dealt with the events in physiology for the thirteen years that had elapsed since the association met in Montreal. After alluding to certain conspicuous events that had occurred, he said of some of the older problems, such as muscular contraction: "Progress, if not exciting, has been real; we are some steps measurably nearer an understanding what is the exact nature of the fundamental changes which bring about contraction and what are the relations of those changes to the structure of muscular fiber. In respect to another old problem, too, the beat of the heart, we have continued to creep nearer and nearer to the full light. Problems again, the method of attacking which is of more recent origin, such as the nature of secretion, and the allied problem of the nature of transudation, have engaged attention and brought about that stirring of the waters of controversy which, whatever be its effects in other departments of life, is never in science wholly a waste of time, if indeed it be a waste of time at all, since in matters of science the tribunal to which the combatants of both sides appeal is always sure to give a true judgment in the end." Of physiological chemistry he said: "The old physiological chemistry is passing away; nowhere, perhaps, is the outlook more promising than in this direction, and we may at any time receive the news that the stubborn old fortress of the proteids has succumbed to the new attack." He discussed as a marked feature of the period "the increasing attention given to the study of the lower forms of life, using their simpler structures and more diffuse phenomena to elucidate the more general properties of living matter." The advances made in the study of the internal secretion, the central nervous system, and the workings of the brain were fully rehearsed and discussed.

Among the more important papers read before this section were the following: "The Rhythm of Smooth Muscles," by Henry P. Bowditch; "The Innervation of Motor Tissues, with Especial Reference to Nerve Endings in the Sensory Muscle Spindles," by Carl Huber; "The Muscle Spindles in Pathological Conditions," by O. F. Grunbaum; "The Ear and the Lateral Line in Fishes," by F. S. Lee; "On the Effect of Frequency of Excitation on the Contractility of Muscle," by W. P. Lombard; "A Dynamometric Study of the Strength of the Several Groups of Muscles and the Relation of Homologous Muscles in Man" and "A Dynamometer for Clinical Use," by J. H. Kellogg; "The Output of the Mammalian Heart examined by a New Method," by G. N. Stewart; "Observations on the Mammalian Heart," by W. T. Porter; "Ueber die naechsten Probleme der Haemodynamik," by Karl Huerthle; "The Comparative Physiology of the Cardiac Branches of the Vagus Nerve," by W. H. Gaskell; "On Rhythmic Variations in the Strength of the Contractions of the Mammalian Heart," by Prof. Cushny; "The Physiological Effects of Peptone," by W. H. Thompson; "The Absorption of Serum in the Intestines," by E. Waymouth Reid; "The Function of the Canal of Stilling in the Vitreous Humor" and "Description of some Pieces of Physiological Apparatus," by Anderson Stuart; "On the Phosphorus Metabolism of the Salmon in Fresh Water," by Noel Paton; "Electrostatical Experiments on Nerve simulating the Effects of Electric Rays," by Jacques Loeb; "Gastric Inversion of Cane Sugar

by Hydrochloric Acid," by Graham Lusk; "Study of the Comparative Physiology of the Cells of the Sympathetic Nervous System," by Carl Huber; "On the Micro-Chemistry of Nerve Cells," by J. J. Mackenzie; "Changes in the Ganglion Cells of Cord after Section of Nerve Roots," by Dr. Warrington; "Action of Reagents on Nerve," by A. Waller; "Action of Anesthetics on Nerve," by F. S. Lloyd; "Action of Anesthetics on Cardiac Muscle," by Miss Welby; "The Refractory Period of Nerve," by Charles Richet; "On a Cheap Chronograph," by W. P. Lombard; "Demonstration of the Pendulum Chronoscope for Accurate Measurements of Time, together with Some Accessory Apparatus" and "The Tricolor Lantern as applied in teaching the Physiology and Psychology of Color Vision," by E. W. Scripture; "Visual Contrast and Flicker Experiments," by Prof. Sherrington; "Microscopic Specimens illustrating the Distribution of Iron in Cells," by A. B. Macallum; "Microscopic Specimens illustrating the Presence of Copper in Cells" and "On the Presence of Copper in Animal Cells," by R. Royce and W. A. Herdman; "On Intestinal Absorption of Haemoglobin and Ferratin," by F. W. G. Mackay; "On Secretion in Gland Cells" and "The Morphology and Physiology of Gastric Cells," by R. R. Bensley; "Visual Reaction to Intermittent Stimulation," by O. Grunbaum; "Functional Development of the Cerebral Cortex in Different Groups of Animals: The Psychic Development of Young Animals," by Wesley Mills; "The Physiology of Instinct," by Lloyd Morgan; "The Nature and Physical Basis of Pain," by L. Wittmer; "On the Action of Glycerin upon the Growth of the Tubercle Bacillus," by S. M. Copeman; "Inhibition as a Factor in Muscular Co-ordination," by C. S. Sherrington; "A Movement produced by the Electric Current," by F. Braun.

On Aug. 24 a joint meeting was held with Section K (botany), at which the "Chemistry and Structure of the Cell" was discussed, and in connection with which the following papers were read: "On the Rationale of Chemical Synthesis," by R. Meldola; "On the Existence in Yeast of an Alcohol-Producing Enzyme," by J. R. Green; and "New Views on the Significance of Intracellular Structures and Organs," by A. B. Macallum.

K. Botany.—Prof. H. Marshall Ward, who since 1893 has been Professor of Botany in the University of Cambridge, presided over this section. His address was devoted chiefly to a review of the advances in our knowledge of the fungi. In opening he alluded to the progress made in the various departments of botany, which were tending toward the specialization of this science—a fact now tacitly, but soon to be openly, recognized. Already the establishment of bacteriological laboratories and a huge special literature; of zymotechnical laboratories and courses on the study of yeasts and mold fungi; of agricultural stations, forestry and dairy schools, and so on, were signs of the inexorable results of progress. After referring to the growth of specialism in botanical study and its reward in the form of a wealth of additional discovery, Prof. Ward entered upon a review of the advances in the knowledge of fungi during the last three decades, dealing particularly with the agency of fungi in alcoholic fermentations. Of the destruction of bacteria he said: "There is one connection in which recent observations on enzymes in the plant cell promises to be of importance in explaining the remarkable destructive action of certain rays of the solar light on bacteria. The English observers Downes and Blunt showed long ago that if bacteria in a nutrient liquid are exposed to sunlight they are rapidly killed. Further researches gradually brought out the facts that it is really the light

rays and not high temperatures which exert this bactericidal action. That these matters are of importance in limiting the life of bacteria in our streets and rivers, and that the sun is our most powerful scavenger, has been shown." The speaker emphasized the need of recognizing that bacteriology only touches animal pathology at a few points, and of the public learning that, so far from bacteria being synonymous with disease, the majority of these organisms appeared to be beneficial rather than inimical to man. Cases were cited as pointing to the conviction that a school of bacteriology which had nothing to do with medical questions, but investigated problems raised by the forster, agriculturist, and gardener, the dairyman, brewer, dyer, and tanner, etc., would yet be established in connection with some great botanical center. The speaker then went exhaustively into the discoveries regarding the exact relation of bacteria to the various methods of cheese and butter manufacturers, and pointed out the value of the researches of many well-known scientists in this subject. Prof. Ward next dealt with the action of fungi upon the roots of forest trees, and then explained the nature of researches and the nitrifying organisms found in manure and soils. With respect to these it was shown that there now exists a sketch of the whole of the down grade of the cycle of organic nitrogen in Nature; it only needs supplementing by the history of the fixation of free nitrogen from the atmosphere by leguminous plants and certain soil organisms to complete the sketch. In conclusion, he dealt with wheat rust and the use of manure.

Among the more important papers read before this section were the following: "On the Mycelium of a Witches' Broom Fungus," by P. Magnus; "Stereum Hirsutum: A Wood-Destroying Fungus," by H. Marshall Ward; "The Nucleus of the Yeast Plant," by H. Wager; "A Disease of the Tomatoes," by W. G. P. Ellis; "The Chimney-shaped Stomata of *Holocantha Emeryi*: Some Consideration on the Functions of Stomata" and "Distribution of Nebraska Trees," by Charles E. Bessey; "On the Species of *Picea* in Northeastern America," by D. P. Penhallow; "Contribution to the Life History of *Ranunculus*," by John M. Coulter; "Vegetation of the Region of the Prairie Province," by Roscoe Pound and F. E. Clements; "The Zonal Constitution and Distribution of Plant Formations" and "The Transition Region of the Caryophyllales," by F. E. Clements; "Note on *Pleurococcus*," by Dorothea F. M. Pertz; "Spermatozoids of *Zamia Integrifolia*," by H. J. Weber; "Diagrams illustrating the Result of Fifty Years' Experimenting on the Growth of Wheat at Rothamsted, England," by H. E. Armstrong; "Preliminary Account of a New Method of Investigating Stomata," by Francis Darwin; "Notes on *Lilaea*," by D. H. Campbell; "Lecture on Fossil Plants," by A. C. Seward; "On the Existence of Motile Antherozooids in the Dictyotaceae," by J. L. Williams; "Insemination in Ferns" and "On more than One Plant from the Same Prothallium," by E. J. Lowe; "Results of Some Experiments in Cross Fertilization," by W. Saunders; "On a Hybrid Fern, with Remarks on Hybridity," by J. B. Farmer; "Morphology of the Stele in Vascular Plants" and "The Gametophyte of *Botrychium virginianum*," by E. C. Jeffrey; "Remarks on Changes in Number of Sporangia in Vascular Plants," by F. O. Bower; "Notes on Fossil Equisetaceae," by A. C. Seward; "On *Streptothrix actinomyctica* and Allied Species of *Streptothrix*," by E. M. Crookshank; "Observations on the Cyanophyceae," by H. B. Macallum.

Also the following reports were presented before

the section: "On the Preservation of Plants for Exhibition" and "On the Fertilization of the Phaeophyceae." On Aug. 24, as previously noted, this section met in joint session with Section I.

Popular Features.—On Aug. 19 their Excellencies the Governor General of Canada and the Countess of Aberdeen gave an evening reception to the officers, members, and associates of the association in the legislative building. The first evening lecture, on "Canada's Metals," by Prof. W. C. Roberts-Austen, was delivered on Aug. 20. On the evening of Aug. 21 a lecture for the workmen of Toronto, on "British New Guinea: The Country, its People, and the Problems which the Region offers to Naturalists and Geographers," was given by Dr. H. O. Forbes. Special sermons were preached on Aug. 22 in St. James's Cathedral by Bishop Sullivan; in St. James's Square Presbyterian Church by President Patton, of Princeton University; and in St. Michael's Cathedral by the Rev. P. A. Halpin and the Rev. Father Ryan. The usual devotional service of the association was held in the university on Sunday under the direction of the Rev. Principal Sheraton. The second evening lecture was on "Earthquakes and Volcanoes," and was delivered on Aug. 23 by Prof. John Milne. The usual *conversazione* was given by the local executive committee in the university building on Aug. 24. On Aug. 25 a dinner was given in honor of Lord Kelvin, Lord Lister, and Sir John Evans in the pavilion of the Horticultural Gardens. Two interesting ceremonies during the week were the convocations of the University of Toronto on Aug. 20, when the honorary degree of LL. D. was conferred on Lord Kelvin, Lord Lister, and Sir John Evans, and that of the University of Trinity College, on Aug. 24, when the honorary degree of D. C. L. was conferred on Sir John Evans, Lord Kelvin, Lord Lister, Sir William Turner, James H. Bryce, and Sir George S. Robertson. The afternoon entertainments included garden parties, several of which were held on each afternoon during the week. In addition to the foregoing, a series of four special excursions—as follow: To Niagara river, Niagara Falls, and return; to Muskoka and return; to Penetanguishene and return; and to Hamilton, Niagara Falls, and return—were arranged for Aug. 21; and subsequent to the meeting the following excursions were provided for: To Toronto, Ottawa, Ottawa river, Montreal, and return; Toronto, Kingston, St. Lawrence river, Montreal, and return; and Toronto, Parry Sound, Algonquin Park, Ottawa, Montreal, and return.

Attendance and Grants.—At the concluding meeting, held on Aug. 25, it was reported to the association that those in attendance at the meeting comprised 120 old life members, 8 new life members, 286 old annual members and members of the American association, 125 new members, 682 associates, 100 ladies, and 41 corresponding honorary members. Total in attendance at the association's meeting, 1,362.

A report from the Committee on Recommendation, setting apart grants to the amount of £1,350 for scientific investigations, was adopted. The grants were as follow: To establish a meteorological observatory on Mount Royal, £50; to further investigate the fauna and flora of the Pleistocene beds in Canada, £20; the collection, preservation, and systematic registration of Canadian photographs of geological interest; the biology of the lakes of Ontario, £75; the northwestern tribes of Canada, £75; to organize an ethnological survey of Canada, £75; the establishment of a biological station in the Gulf of St. Lawrence.

Next Meeting.—The association will meet in 1898 in Bristol on Sept. 5-17, and for the presi-

duces Sir William Crookes, eminent for his researches in chemistry and in physics and the editor of the "Chemical News," has been advocated.

ASTRONOMICAL PROGRESS IN 1897. The number and importance of the astronomical discoveries during the year, though not equal to those of some others, are in the main satisfactory. Excepting the discovery of a few asteroids and a new comet of short period, no new member has been added to the solar system.

The Sun.—Our knowledge of the cause of the Sun's heat and light, and of his spots, pores, and faculae, but especially of his mysterious appendage, the corona, has made little or no advance since our last report. To settle some points in dispute much was expected from observations of the total solar eclipse of Aug. 9, 1896; but on the return of the parties sent out by different countries to observe it—mostly to Norway, Sweden, and Japan—astronomers were disappointed at the meager results achieved, caused by cloudy skies at every station. Another effort, on a still more extensive scale, will be made to observe telescopically, spectroscopically, and photographically the eclipse that will take place Jan. 21, 1898. The line of totality will pass through Central Africa, India, and China, to the southern boundary of Siberia. The width of the total belt will be but 57 miles, and the duration of totality but $2^m\ 19^s$. Yet, owing to improved methods of observation, more can be accomplished in that short time than could have been done at any former eclipse of twice its duration. One of the California parties will be prepared to test the utility of an invention of Mr. Burkhalter, of Oakland, Cal., which was prevented by clouds in Japan in 1896. This consists of a device to proportion the time of exposure of a photographic plate to the intensity of the light in different parts of the field, thus preventing over-exposure of the inner corona, and under exposure of the outer coronal streamers, which heretofore has been an impossibility. Astronomers anticipate valuable results from the trial test, which will enable the corona and its streamers to be studied at leisure and compared with photographs taken at future eclipses.

On Jan. 3, 1897, a spot of enormous dimensions appeared on the Sun's eastern limb. It was distinctly visible to the naked eye. With the telescope vast cyclonic movements in the Sun's photosphere were conspicuously visible, on a scale of magnitude of which nothing on our planet furnishes a standard for comparison. It subtended an angle of $100'$ in diameter, and as a second of arc at the Sun's distance equals 450 miles, it follows that the diameter of the spot was $450 \times 100 = 45,000$ miles wide, or 1,580,000,000 square miles. This, appearing near the epoch of minimum spot activity, was a great surprise to astronomers. On Jan. 10 it reached its maximum magnitude, and then began rapidly to decrease, and when it was at half of its greatest size disintegration began, resulting in a trail of spots resembling a long train of cars. In the preceding November a spot appeared of $80'$ in diameter, which remained intact during two rotations of the Sun, or for fifty-two days, affording a rare opportunity to decide whether, after all, the spots are not elevations instead of depressions according to Wilson's theory. Astronomers are now pretty well agreed that the latter, which for one hundred and twenty years has held sway, must be abandoned. His theory was that the Sun is a dark body surrounded by a luminous atmosphere (the photosphere), and that the spots are immense depressions, opening to view the Sun's dark body (umbra), and that the penumbra is the sloping sides of the hole, hundreds if not thousands of miles in depth. The theory appeared so reasonable, and

accounted so clearly for their appearance through the telescope, that it had with general acceptance by astronomers. If it is true the Sun has two atmospheres, the outer chromosphere, 5,000 miles in thickness; the inner photosphere, of unknown depth.

The Sun's corona, which near it is a continuous luminous halo, but beyond consisting of streamers several million miles in length, the spectroscopist decides to be reflected sunlight. It is never seen but during the few precious minutes of totality. Of the source and nature of the reflecting material we know nothing. The inner corona may be, and probably is, another atmosphere outside the chromosphere, extending to a great height, too thin to be noticed except during totality.

Recent observations of the prominences, which can now be seen with the spectroscope without an eclipse, fully confirm the truth that they belong to the Sun and not to the Moon, as was once thought might be the case. Their source is the chromosphere; but the intensity of the central force that can throw them to a height in one instance 50,000 miles farther than the Moon's distance from the earth is inconceivable, and affords an overwhelming argument against the truth of the Wilsonian hypothesis that the Sun is a dark, cold body.

Lewis Jewell, of Johns Hopkins University, has been measuring a large number of lines in the photographs of the solar spectrum, and has found that there is a difference of several days in the rotation periods of the outer and inner portions of the Sun's atmosphere, the period increasing as the photosphere is approached. He is now engaged upon the reduction of the measures, and the result will be awaited with great interest, as he has perhaps made an important discovery in solar physics.

Evolution of Stellar Systems.—Spiral nebulae, according to Dr. Isaac Roberts, the distinguished stellar photographer, afford almost positive evidence of evolution of the nebulae into suns and stellar systems. Photographs of these objects—notably those in Pisces, Ursa Major, and Canes Venatici—afford abundant proof when compared with star clusters already evolved. The photographs show the nebulous matter broken up into stars and starlike loci. The brighter stars are well defined, but the fainter ones have nebulous margins, as have those whose brightness differs but little from the nebosity in which they are immersed. He says that every spiral nebula photographed by him has a stellar nucleus surrounded by dense nebosity, around which the nebulous convolutions and involved stars are symmetrically arranged, and this is strong evidence that these features are the result of known physical causes and not of fortuitous arrangement. He considers that collisions between solid bodies or streams of meteors are sufficient to account for the vertiginous motions as seen in spiral nebulae. Nova Auriga and Nova Andromeda and many other temporary stars are evidences of collisions. Photography, therefore, shows us nebulae in all stages of development from diffused masses of matter, like the great nebula in Orion, through spiral nebulae, to clusters of stars.

Celestial Spectroscopy.—Spectroscopic analysis of the light from self-luminous heavenly bodies continues with unabated enthusiasm. Some observatories make it a special and exclusive study. Zeta Puppis presents an abnormal spectrum, giving, in addition to the usual hydrogen lines, a second series of rhythmical lines. Some of these are also to be seen in 29 Canis Majoris and γ Velorum, some being bright and others dark.

There has been a suspicion that helium is a mixture of two elementary gases, as by a process of diffusion it is possible to get to gases of widely

different densities. Samples of heavy and light gas were examined with a concave grating of 15,000 lines per inch, and in no case was any difference found in the spectra of various samples. The helium line was discovered in the yellow of the solar spectrum twenty-five years ago, but until lately no representative could be found on the earth. As it was always seen close to the D₂ line of sodium, it is also known as D₃. The spectroscope reveals the existence in the sun of 23 substances that we are familiar with here, but no oxygen or gold.

Prof. Pickering's recent report announces the safe arrival at the Harvard station, Arequipa, Peru, of the great Bruce photographic telescope, which is under the skillful management of Prof. Solon I. Bailey. It is devoted to photographing the spectra of faint stars, with the large prism placed before the object glass. A large number of objects having peculiar spectra have been detected, including 21 new variables, two new stars, *Nova* Carinae and *Nova* Normae, also a new variable of the Algol type, W. Delphinii, having a variation of 2.71 magnitudes. A new star has also been discovered in Centaurus by Mrs. Fleming on examining some of the Draper Memorial photographs taken at Arequipa. No trace of it could be seen on the 55 plates taken from May 21, 1884, to June 14, 1895. But on plates taken on July 8 and 10, 1895, its magnitude was 7.2. In December following it had sunk to the eleventh magnitude. It was discovered from the peculiarity of its spectrum as taken on July 18, which resembles that of the nebula surrounding 30 Doradus, and also of the star Argentina, General Catalogue 20937. Its spectrum, examined visually on Dec. 19, was monochromatic, like nebula, New General Catalogue 5253.

At Harvard College Observatory an immense amount of work has been done, as the following breviary will show: During 1896 20,000 photometric light comparisons were made, 4,192 to determine the form of the light curve of the Algol-type variable W. Delphinii, 3,436 of U. Cephei, 1,616 of Z. Herulis, 748 of T. Andromeda, 752 comparisons of Omicron Ceti, and many others, including 26 eclipses of Jupiter's moons. A study was made of parallel lines, similar to the assumed double canals of Mars, with the result that is unfavorable to their duplicity. In addition, 2,508 photographs have been taken with the Draper telescope, and 2,770 at Arequipa with the Bache photographic telescope. Many peculiar spectra have been found on the plate, 21 of them having the hydrogen lines bright. All these photographic plates are dated, numbered, and preserved in a fireproof building.

Motion of Stars.—The spectroscope, in its improved form, is being used to determine the velocity of approach or recession of stars to or from our system. In "Monthly Notices of the Royal Astronomical Society of England" for June, 1897, is the result of measures by H. F. Newell with the Bruce spectroscope attached to his 25-inch refractor at the Cambridge Observatory, England, with the following results: Recession Alpha Tauri (Aldebaran), 30 miles a second; Alpha Orionis, 10.6 miles. Approach Gamma Leonis, 37.5 miles; Arcturus, 6.8 miles.

Broadening of Lines.—Dr. Zuman has discovered that the spectral lines in a magnetic field are broadened. This fact is considered of special importance in connection with astrophysical science. Prof. Lodge has succeeded in showing that the lines not only broaden, but are split up into twos and threes and even more. Dr. Zuman's discovery is considered the most important that has been made during the present year.

Nova Auriga.—This remarkable temporary star, which in less than two months in the beginning of

1892 changed from the fourth to the fourteenth magnitude, and then increased to the 9.7th, and so remained for three years, finally changing into a nebula, has recently decreased again to the eleventh magnitude. Nothing has been more puzzling to astronomers than the behavior of this extraordinary temporary star.

New Double Stars.—The discovery of double and triple stars has reached enormous proportions, which raises the question whether single stars like our sun, which is also a star, are not the exception instead of the rule. "The Monthly Notices" for May, 1897, contains a list of 146 discovered at the Cape of Good Hope Observatory. The position angles, distances, and magnitudes of the components and their places for 1900.0 are given. The closest pair is 0.6". Recent observations of the southern sky by Dr. T. J. J. See, while at Mr. Lowell's temporary observatory at the city of Mexico, discovered several new pairs, and several double and wide pairs which he resolved into triple systems. One which deserves particular mention is Mu Velorum, of nearly the third magnitude, and its companion, of the eleventh. This pair was previously discovered by Russell, of Sydney, Australia. Dr. See, in the "Astronomical Journal," No. 399, says: "Assuming that there is no typographical error in the angle given, it is clear that we have here a case of rapid, direct motion; a change of 57.2° in 16.72 years implies a period not far from a century." He finds that Alpha Phoenix and Eta Centauri are binaries, and many others discovered subsequently.

Prof. S. W. Burnham, of the Yerkes Observatory, the distinguished double-star discoverer and observer, condemns many of the pseudo orbits of alleged binaries. Among those recently criticised are Lambda Cygni and Xi² Aquarii. He gives in several astronomical publications diagrams of the supposed orbits, and shows in the case of Lambda Cygni that a straight line satisfies the observed positions of the components better than Prof. Glasenapp's ellipse with its 93.4-year period, and that in the case of Xi² Aquarii it may have any period between three hundred and fifty years and 1,578.33 years. All this, he says, is the result of a premature attempt to fit orbits to such stars after they have been observed through but a small part of their orbits. These facts are strikingly exhibited in his drawings and comments thereon.

Spectroscopic Binaries.—Prof. Pickering announces the spectroscopic duplicity of Mu¹ Scorpii from an examination of the Draper Memorial photographs by Prof. Bailey, Arequipa. The spectrum is of the first type, and also contains lines characteristic of the Orion stars. The spectra of both Mu¹ and Mu² are close beside each other on the negative plate, and on some plates they present a very similar appearance. The lines in the spectrum of Mu² are always single and sharply defined, but those of Mu¹ sometimes grow broad and hazy, and then double. The same changes were noted by Mrs. Fleming on plates taken in 1892 (Oct. 2) and in 1894 (July 20 and 31), which leaves no doubt that one of the components is a single star; the other, Mu¹, a spectroscopic double. The period of Zeta Ursa Majoris is fifty-two days, of Beta Auriga 3^d 2^h 46^m, while that of Mu¹ is only 34^h 42^m 30^s in a circular orbit. Another spectroscopic double having the same period as Beta Auriga is the star Lacaille 3105—right ascension 14^h 40^m 7^s; declination south 25° 5' 18".

Prof. A. Belopolsky has found that Alpha¹ Geminorum, one of the companions of Castor, is also a spectroscopic binary. In January, 1896, he began the investigation of this star by spectrum photography, and he found as the result of 30 photographs

taken between January and April that the star is a close spectroscopic binary. With an exposure of one hour the spectrum showed H. lines and the stronger lines of iron. On reducing the several values obtained, it was found that there was a periodicity of 2.9 or three days. The velocities and the values for the period obtained during January and February, compared with the others, showed a discrepancy that can not yet be explained. This may be caused by a rapid motion of the line of the apses in the direction of the orbital motion, or perhaps an odd number of half periods have been lost or gained between April and November. The photographs obtained at Cambridge, however, appear to support Belopolsky's important discovery. We have here, in the triple system of Castor, two periods—one of about one thousand years, the other of about three days.

A telescopic binary is a double star both components of which are visible with a telescope and are found to revolve around the common center of gravity. A photo-spectroscopic binary is also a double star, only one component of which is telescopic, the other being a star that no man has seen. If the orbital plane of a binary is coincident with the solar system, there must be a time at each revolution when one star will be approaching the earth and the other receding from it, and *vice versa*. As a spectroscopist takes cognizance of the motion of a star toward or from us in the line of sight (which a telescope does not), and as each star gives a spectrum crossed by lines, it will periodically happen, while neither star is moving toward or from us, that all lines on the photographic plate will appear single. When one star begins to approach and the other to recede from us the lines will appear hazy, but when the approach and recession of the stars reach a maximum the lines in the approaching star will be displaced toward the violet, and those from the receding star toward the red end of the spectrum, causing the lines to appear double. These lines, being photographed at short intervals, produce an imperishable record for comparison to ascertain the period of revolution by the periodic doubling of the lines. But for the assistance of photography this feat never could have been accomplished. In the case of μ^1 Scorpii their velocities in all probability amount to several hundred miles a second.

Telescopic Binaries.—The discovery of suns revolving around suns, and the computation of their orbits and periodic times, has to many astronomers a resistless charm. New ones are constantly being added to the long list of over 1,000 known binary stars. In the time of Sir William Herschel but few were known, though he discovered 50. χ Ursa Majoris was then found to be the shortest period binary known—sixty-one years; then came Eta Coronæ, with a period of forty-two years, and, later, Zeta Herculis was found to have a period of thirty-four years. Twenty years ago 42 Comæ Berenices was ascertained to have a period of twenty-five years, and in 1887 the components of Kappa Pegasi were found to revolve round each other in 11.5 years; and now comes a candidate for the shortest known, only 5.5 years. The star is Burnham's 883 = Laland 909. The shortness of its period brings us a long way over the gap that separates the telescopic from the spectroscopic binaries. The discovery of its periodic time was lately made by Dr. T. J. J. See. His opinion is fortified by a long series of measures, which leave no doubt that his conclusions are correct. The apparent orbit of this rapid binary is: Length of major axis, 0.67; length of minor axis, 0.16; angle of major axis, 19.5; angle of periastron, 318; distance of star from center, 0.07; period, five years and a half.

Rediscovery and Orbit of Sirius.—This, the brightest star in the heavens, often called the dog star, was discovered to be double by Alvan G. Clark in 1862, for which he received the Royal Astronomical Society's gold medal. In consequence of the variation of its proper motion, it was long before assumed to be double, being swayed hither and thither by an unseen companion, and a period was computed for it of about forty-eight years. Of course the pair were watched with great care, but the observed path was too short from which to deduce even an approximate orbit, and thus resulted in the computation of 12 orbits, varying in periods from 49.5 to 38.5 years. The last view of its companion was obtained by Burnham in 1890 with the 36-inch telescope at the Lick Observatory, and no telescope in the world could follow it later. For six years and a half it was beyond the reach of any telescope. In the latter part of 1896 Prof. Aitken, with the great Lick glass, rediscovered it. The arc passed over by the companion during its invisibility was 170. Its position angle when discovered by Clark was $85 + 170 = 225$ of areal motion, from which its period was computed by Burnham, who made it 51.8 years. The apparent orbit is given in "Monthly Notices" for April, 1897, as: Length of major axis, 14.48; length of minor axis, 9.32; star from center, 4.09; angle of major axis, 54.4; angle of periastron, 251.9; period, 51.8 years.

Dr. See announces that the binary star Burnham 395 = 82 Ceti revolves in sixteen years. The computation is now near periastron, angle 278, distance 0.22. This star has not heretofore been suspected to be a short period binary, but it appears from Dr. See's investigations that $1\frac{1}{2}$ revolution has been completed since Burnham's discovery in 1875, making it one of the most interesting binary systems in the heavens.

Star Systems.—That the heavens afford many star systems besides the clusters is of universal belief, but Proctor's opinion that five of the seven stars comprising the bowl of the great dipper in Ursa Major are thus associated does not meet with general acceptance. In the first place, their proper motions are so small as to form a very slender thread on which to hang so strong a theory. It is, however, favorable to the idea of a physical connection between the five that they all present the same kind of spectrum (A). But Eta, admittedly not belonging to the system, also gives the spectrum A, while Alpha has the spectrum K, and has less than half the velocity in the line of sight of the other six.

Variable Stars.—The discovery of variable stars has been pushed with an energy heretofore unknown. As its prosecution requires no expensive instruments, it opens a fascinating field to amateurs. Dr. S. C. Chandler, editor of "Gould's Astronomical Journal," the best authority on variables, has published in the journal three extensive catalogues, which give full details of 8,622 members. It is the most extensive catalogue extant. The subject is too voluminous to be dealt with here. Only a few of the more remarkable can be noticed. Prof. E. C. Pickering, in "Astronomische Nachrichten," No. 3321, gives an account of the discovery by Prof. Bailey, at Arequipa, of numerous variable stars in certain globular clusters, and their entire absence in others, apparently belonging to the same class. Since then he has found many more, so that their total number now known, including a few found at Cambridge, is 310. The number in only two can be noticed. In the Omega Centauri cluster Prof. Bailey has detected 60, and in Messier 5 (New General Catalogue 5904) 63 have been discovered. In Messier 3 about one ninth of the stars are variable, while in the cluster in Hercules not one varies.

The number thus far discovered averages 22 to a cluster, which is out of all proportion to the average number of variables scattered over the heavens.

Discovery of Nebulae.—Since the last report Dr. Lewis Swift has discovered and published the places and descriptions of 130 new nebulae. They are mostly southern, beyond the reach of Sir William Herschel and of all northern observatories. Isaac Roberts, in photographing clusters and nebulae, has found on his negative plates 17 new nebulae not in any catalogue. One of them, in right ascension $15^{\text{h}} 30^{\text{m}} 30^{\text{s}}$, declination north $26^{\circ} 37' 42''$, is remarkable, being only 8' from that large well-known one in the triangles (New General Catalogue 672). He describes it as being nearly as large and bright as the well-known nebula. The central part consists of six faint stellar condensations, forming a straight line. It is certainly singular, as he says, that this nebula has so long escaped detection. The writer, however, can not subscribe to his opinion, that it has probably come into visibility during the past half century. If he is right in his bold conclusion, it raises a new and curious question of mighty import. Astronomers are familiar with new stars, but the advent of new nebulae is a novelty inviting investigation.

Rotations of Mercury, Venus, and Uranus.—Herr Leo Brenner, of the Manara Observatory, claims that he has determined the rotation periods of all these planets. He has forwarded 20 drawings of Mercury, which show not only evidence of change in the planet's markings, but also polar snow caps, which on one occasion were as bright as those on the poles of Mars, from which he argues that the observed markings prove that the slow rotation of the planet in eighty-eight days is an impossibility. The discussion of the rotation periods of Mercury and Venus has assumed vast proportions, with exhibition of some asperity. In "Monthly Notices" for January, 1897, Percival Lowell, from his private observatory at Flagstaff, Arizona, publishes some interesting observations made by him on Mercury and Venus. He finds the markings on Mercury to be conspicuous, and easier, in comparison, to see than any of the markings on Mars except the seas. They were visible at all times when the seeing was good. Those on Venus are long and narrow, and perfectly distinct. The disk is quite clear of clouds, and is brightened by a luminous atmosphere. There is no evidence of the existence of polar ice caps. From careful drawings, he concludes that the period of rotation is undoubtedly equal to her revolution—two hundred and twenty-five days. In a recent number of the "Publications of the Astronomical Society of the Pacific," Prof. Holden says that he has observed Venus from 1873 to 1890, with telescopes of 6, 16, 26, and 36 inches aperture, without seeing markings of the kind depicted by Mr. Lowell, and adds: "I have no hesitation in saying that such markings as he has shown did not exist on Venus before 1890, and it is my opinion that they do not now exist on the planet, but are illusions of some sort." Herr Brenner makes the rotation period of the planet Uranus about eight and a quarter hours.

Mars.—The long-disputed question of the value of the compression of Mars has at length been settled beyond further controversy. The eye, in measuring disks, is influenced by errors of estimation in different directions with respect to the vertical line. Since the use of small reversion prisms on the eyepiece of the heliometer has been adopted, in which the diameter of a planetary disk can be made to appear in any direction with respect to the vertical, it is possible to get free from these abnormal eye estimations. Prof. W. Schur, of the Royal Observatory, Göttingen, using the Repsold heliometer objective of 162 millimetres in diameter,

armed with a power of 174, from the mean of several comparisons made the equatorial diameter $6'256''$, and the polar $= 6'120''$, compression $= \frac{1}{4}$.

Observations made on the south polar spot on Mars by O. Lohse give ample reason for belief that the position of its center has not varied for more than one hundred years, and that after entire dissipation of the snow it would again form around the same point. During the opposition of Mars in 1896 the reappearance of the polar cap was watched with great interest after its disappearance in 1894. Mr. Crull was the first to detect the newly formed cap in June, 1896, and from his micrometrical measures the following co-ordinates were deduced: Areographical longitude, 276° ; polar distance, 59° . The Martian year consists of six hundred and sixty-eight Martian days, which for the northern hemisphere are distributed as follows: Spring, one hundred and ninety-four; summer, one hundred and seventy-six; autumn, one hundred and forty-two; and winter, one hundred and fifty-six. Confirmatory of the existence of canals and seas on Mars is the statement of Capt. P. B. Molesworth, of Ceylon, who, with a reflecting telescope of $9\frac{1}{4}$ inches aperture, without any previous knowledge of Schiaparelli's drawings, has drawn the canals and seas, which differ but little from those of Schiaparelli, Lowell, and others. Other astronomers besides those mentioned above have filed claims to their discoveries, notably Herr Brenner, who claims to have seen as many as 31 canals not before recorded. During the last opposition the canals were seen double by several observers. An important point, if true, in connection with the doubling of the canals, is the liability of some of the dark spots, called lakes, to become double also, which raises the question whether the duplicity of the streaks is not after all an optical illusion caused by some defect in the eye or the telescope.

Asteroids.—The following asteroids, or planetoids, or minor planets, as they are variously called, have been discovered since the last report:

No.	Name.	Discoverer.	Date.
418.....	CV.....	Wolf.....	Sept. 7, 1896.
419.....	CW.....	Wolf.....	Sept. 7, "
	CX.....	Wolf.....	Sept. 7, "
420.....	CY.....	Wolf.....	Sept. 7, "
421.....	CZ.....	Wolf.....	Sept. 7, "
422.....	DA.....	Witt.....	Oct. 8, "
	DB.....	Charlois.....	Dec. 7, "
425.....	DC.....	Charlois.....	Dec. 28, "
	DD.....	Charlois.....	Dec. 31, "
	DE.....	Charlois.....	Dec. 31, "
	DF.....	Charlois.....	Dec. 31, "
	DG.....	Charlois.....	Aug. 28, 1897.
	DH.....	Charlois.....	Aug. 25, "
	DJ.....	Charlois.....	Aug. 27, "

The following have received names:

324	Bamberga.	348	May.	416	Vaticani.
342	Endymion.	350	Ornamenta.	430	Bertholda.
345	Terceania.	354	Eleonora.	421	Zähringia.
346	Hermonstaria.	412	Elizabetha.	422	Berolina.
347	Pariana.	413	Edburga.		

Jupiter.—The rapid changes in Jupiter's north equatorial belt are attracting much attention, especially its great increase in width, which is now nearly equal to that of the southern. This is more remarkable as following a period of quiescence. The cause of these changes in his atmosphere, the sudden appearance of spots (white, black, and tinted), and of his immense belts and their occasional doubling, and projecting of marginal spurs from them, often fantastic, and numerous other phenomena must ever furnish fruitful questions for speculation. Many of these details were seen on Feb. 23, 1897, the faintest of which were seen only by glimpses and vanished before they could be

sketched. The great brick-red oval spot, first seen in 1878, is still faintly visible. It is 30,000 miles in length and 7,000 miles in breadth. Its persistence of form is not the least remarkable feature. For years it had a translatory motion of its own, which has now ceased. It is doubtful if photography will ever avail us much, as the image of the entire planet on the negative plate would be only one sixteenth of an inch in diameter, and of course details would be microscopic. Jupiter's fifth satellite was measured on Feb. 27, 1897, by Prof. J. M. Schaeberle at the Lick Observatory, the places agreeing with Marth's ephemeris fairly well. From long-continued observation of Jupiter with the Göttingen heliometer, Prof. Schur has determined the values for the equatorial and polar diameters of the planet to be 37.42" and 35.13" respectively. The apparent diameters generally adopted by astronomers are 49.9" in opposition and 30.4" in conjunction, or 40.15" at mean distance. His diameter is usually given as 87,900 miles, and his spheroidality about $\frac{1}{10}$ or 5,500 miles, surpassing in this respect all the planets except Saturn.

Comets.—Swift's periodic comet was not found on its return in January, 1897. As its period is five and a half years it, like nearly all others having a fractional year period, can only be seen at alternate returns to perihelion, as the half year brings the Sun in the neighborhood of the comet.

Comet f 1896 (Perrine's).—This periodic short-period comet is another addition to the long list of Jupiter comets. It was discovered by Perrine at the Lick Observatory on Dec. 8, 1896. It had a star-like nucleus and a tail 30' in length. Like all short-period comets, except Encke's, it was not visible to the naked eye. Its elements, except in one particular, bear a close resemblance to those of the long-lost divided Biela's comet. The elements of both are placed side by side for comparison:

PERRINE'S COMET.		BIELA'S COMET.	
Perihelion passage, Nov. 24-65% Berlin mean time.		Longitude of perihelion.....	106° 8'
Node to perihelion.....		Longitude of node.....	245° 52'
Node.....	163° 33' 30.0"	Inclination.....	12° 33'
Longitude of node.....	246° 34' 35.9"	Perihelion distance.....	0.8606
Inclination.....	13° 40' 25.9"	Period.....	6.62 years.
Period.....	6.441 years.		

Comet 1897 I (Perrine's).—This comet's orbit is a parabola, and therefore it appeared for the first and last time, as only comets moving in elliptical orbits can ever visit our system the second time. Its elements are as below. It was discovered Nov. 2, but reckoned in the order of perihelion passage, instead of date of discovery, it becomes Comet I 1897. Perihelion passage, 1897, Feb. 8-1762, Berlin mean time; node to perihelion, 172° 20' 59.7"; longitude of node, 26° 17' 51.1"; inclination, 146° 8' 24.9"; perihelion distance Earth = 1, 1-062234.

D'Arrest's Comet.—This long-known short-period comet was found at the Lick Observatory by Perrine on June 28, 1897, in right ascension 30° 11' 9", polar distance 83° 46' 29". This is its seventh return since its discovery by D'Arrest in 1851. It is the faintest of all the short-period comets and often escapes detection, though always carefully and systematically searched for.

The "Bulletin Astronomique" for March, 1897, contains a thorough investigation by L. Schulohf of the orbit of Comet Swift 1895 II previous to 1884. He had previously suggested the probable identity of the comet with that of Lexell, and requested astronomers to obtain as long a series of observation of it as possible, in order to obtain its elliptical elements with the utmost accuracy. Those made at the Lick Observatory extended over five months and enabled the elements to be ascertained

with considerable accuracy. The daily motion is 490.51" and the period 7.2043 years. The probable error of daily motion is only half a second of arc, making an error in the period of only three days; but, small as it is, it prevents the accurate computation of the perturbations by Jupiter back to the year of Lexell's discovery in 1779, since which time it has been lost. Even in 1838 it is impossible to say within forty days when the comet was at any assigned point of its orbit. Until this comet has been observed at another return it can only be assumed that the identity of the comet with Lexell's is very probable. It may be again visible in 1902, but it will be very faint and in considerable south declination. If it then escapes detection there is no hope of seeing it before 1931.

Gegenschein.—This is an exceedingly faint circular patch of evenly diffused light seen by the naked eye only, always in the zodiac and opposite the Sun or 180°. Its diameter varies somewhat, being generally about 20' in diameter, and sometimes as much as 25'. Dr. E. E. Barnard sees a zodiacal band 3 or 4' in width extending from it to both the morning and evening zodiacal light. He has been assiduous in its observation for many years, as has also Prof. Searle, of Harvard College Observatory. Barnard has recently described in "Gould's Astronomical Journal," No. 403, May, 1897, its various appearances as follows: "When first seen in autumn it is unaccompanied by a zodiacal band, but later, when its right ascension is 0^h 0^m, it becomes elliptical and the band appears extending to the apex of the evening and morning zodiacal light. There appears at different times an oscillation east and west of about 1', with a tendency to a less longitude than 180°. It is impossible to explain on any hypothesis the cause of this light or counter glow, as it is often called.

The writer of these notes, after much reflection resulting from his own observations, suggests the following as the cause of the *Gegenschein*—viz., that it is caused by refracted and reflected sunlight precisely in the same manner as the red Moon when totally eclipsed. The sunlight passing tangentially through the Earth's atmosphere, which forms the boundary between sunlight and darkness, is refracted down upon the Moon and then feebly reflected to the Earth, rendering her visible, although totally immersed in the Earth's shadow. In this case it is the Moon that is the reflector, but in the case of the *Gegenschein* it is cosmic dust that is the reflector. That our atmosphere, and indeed all space, is impregnated with dust, is conceded by all astronomers. That the light is always opposite the Sun is a significant point in favor of this hypothesis. The subject is attracting increased attention, and there is hope that the cause of this strange phenomenon may be satisfactorily explained.

Zodiacal Light.—Another phenomenon, equally inexplicable and perhaps indirectly allied to the *Gegenschein*, is the zodiacal light, visible as a broad conical luminous beam in the west after sunset during the autumn and winter months and in the east before sunrise during the spring months. The spectroscope has recently shown that the light is sunlight reflected from some kind of noncoherent matter in the solid form. It has been seen circling the sky from the western to the eastern horizon, and must be treated, therefore, as a luminous ring circling the Earth instead of the Sun.

Unification of Time.—The international unification of time has been adopted in nearly every country except France, Spain, and Portugal. England, Belgium, Holland, and Luxemburg use western European time. Central time is adopted by Italy, Switzerland, Germany, Denmark, Norway, and Sweden. Russia, Roumania, Bulgaria, and Euro-

year Turkey use eastern time. In Natal, Australia, New Zealand, and Japan the time zones used are eight, nine, ten, and eleven hours east of Greenwich. Canada and the United States use four time zones, four, five, six, seven, and eight hours slow of Greenwich time. Since May, 1897, Belgium has reckoned time continuously from 0^h to 24^h—that is, the next hour after noon will be thirteen o'clock.

Largest Spectroscope.—The largest spectroscope in the world has just been completed by John A. Brashear, of Allegheny, Pa., for Dr. Hans Hauswaldt's Astronomical and Physical Observatory, Magdeburg, Germany. It is 21 feet long and requires for working it a room 28 feet square. The size of the grating is 6 inches, and it is ruled with 18,333 lines to the inch, between which there is no difference greater than three millionths of an inch. It reveals in the solar spectrum over 2,000 lines belonging to iron. In the infancy of spectroscopy the sodium line (Fraunhofer's D) was considered single, which the spectroscope of to-day doubles, called D¹. This mammoth instrument shows each to be double and so wide apart are the pairs that 15 lines are revealed between them. Some of them, and perhaps all, may turn out to belong to our atmosphere. It also doubles the famous helium line, or H¹. The spectrum of the Sun has been photographed by it to 60 feet in length, crowded with lines from end to end. It is so arranged that, no matter what part of the spectrum is desired to be photographed, the negative plate is always in focus. The following method of photographing the solar spectrum and that of other heavenly bodies can not fail to settle many disputed points and may originate as many new ones as it settles. Suppose it is desired to ascertain whether any terrestrial substance, say calcium, is in the condition of a gas in the Sun's atmosphere: The sunlight is turned into the slit of the spectroscope, narrowly closed for sharpness of the lines to be photographed, and photograph the center of the Sun on the center only of the negative plate. An opaque bar is now placed over this part of the plate. The electric arc light, in which has been placed in the concavity of the lower carbon pencil a small piece of calcium, is turned on the slit and the spectrum of calcium is photographed on each side of the opaque bar. When the plate is developed there is a picture on which the calcium spectrum with its lines is shown, and if there be any in the Sun's spectrum they can in a moment be identified by their coincidence. If this be the case we know that calcium exists in the state of vapor in the Sun's atmosphere.

Yerkes Observatory.—The largest and most powerful refracting telescope in the world has recently been successfully mounted in the Yerkes Observatory, at William's Bay, Wisconsin, near the shore of Lake Geneva, 75 miles north of Chicago. The glass, 40 inches of clear aperture, has been by experts pronounced of superior excellence and has been received by the trustees. Much is expected of this gigantic telescope, which, from some discoveries already made and reported, will not disappoint the generous donor, Charles T. Yerkes, of Chicago. The following data will give the reader something of an idea what the making and mounting such a telescope in time, skill, labor, patience, and money means. The amount of the latter, including the observatory, was more than \$1,000,000. The two disks of crown and flint glass, 41½ inches in diameter, each free from stria, bubbles, and inequality of density, cost in Paris, in the rough, about the shape of two large, thin grindstones, \$40,000. Four years were spent by the late Alvan G. Clark, at Cambridgeport, Mass., in grinding them to the right curves and polishing them. The clear available aperture is 40 inches, and so perfect are the figures

of the four surfaces that every ray of light from a star falling on the great disks is refracted and dispersed by the crown disk and again oppositely refracted by the flint to a very small point. The price of the completed objective, as an object glass is called, with its cast-iron cell, was \$100,000. It weighs 1,000 pounds. The outer crown lens is 2½ inches thick at the center and ¼ inch at the edge, and weighs 200 pounds. The heavy flint-glass disk is 2 inches thick at the edge and ¼ inch at the center, and weighs over 300 pounds. The two glasses in their cell are 8½ inches apart. The resulting focus of the combined lenses is 66 feet. The tube is of sheet steel, 64 feet long and 52 inches in diameter at the middle, tapering toward the ends, and weighs 6 tons. The pedestal and head, which are of cast iron, rise to a height of 43 feet, and weigh 50 tons. A winding staircase ascends to the driving-clock room and reading circles and to the balcony surrounding the head. The polar axis is of steel, 15 inches in diameter, 13½ feet long, and weighs 3½ tons. The declination axis is also of steel, 12 inches in diameter, 11½ feet long, and weighs 1½ ton. The driving clock weighs 1½ ton, and is wound automatically by an electric motor. A double conical pendulum controls the driving clock, and is geared to the main driving wheel, 8 feet in diameter, which, together with the tube, weigh 20 tons, driven in exact sidereal time. The circular floor, 75 feet in diameter, is raised and depressed 25 feet by an electric motor by simply touching a button, so that a high observing chair is not required. The center of motion of the telescope is 70 feet from the floor. The dome is the largest in the world, and weighs 70 tons.

Publications.—Harvard College Observatory has lately published two volumes of its annals, one concluding the zone observations, which has extended through Vols. XV, XVI, XXV, XXXV, and the one just issued, XXXVI. The other is devoted to a description of the spectrum of bright stars photographed with the 11-inch Draper telescope, and discovered by Miss A. C. Maury. Two hundred and fifty pages of Vol. XXV are devoted to discussion of the proper motions of the stars, deducible from the observations. In a series of preliminary notes she has discussed the relation of the spectra of the Orion stars to that of helium.

Prizes.—The following prizes have been awarded to astronomers since the last report: The Laland prize of 540 francs was awarded to M. Puiseux for his selenographical work. The Valz prize was bestowed on M. Possett for the reduction of old observations previously inaccessible. The Janssen prize was given to M. Deslandres for his studies and investigations in spectroscopy. The Mrs. Jackson-Gwilt medal, of the Royal Astronomical Society of England, was awarded for the first time to Dr. Lewis Swift, of the Lowe Observatory, Echo Mountain, California, for his numerous discoveries of comets and nebulae. It consisted of a large bronze medal and \$125.52 in cash. The prizes of the Paris Academy of Sciences have been awarded as follows: The extraordinary prize of 6,000 francs has been divided between M. Darriens and to M. Banle, for the application of the gyroscope to determine the altitude of the stars at sea. M. Faye, the distinguished astronomer of France, has been awarded a gold medal by the Paris Academy, in honor of his jubilee, he having been elected a member in 1847. The Royal Astronomical Society of England bestowed its gold medal on Dr. E. E. Barnard for the discovery of the fifth satellite to Jupiter, and other important discoveries in astronomy. The German astronomer Prof. Dr. Arthur Auwers, has received from the German Emperor a gold medal for his services to science, especially to astronomy.

M. Alfred Nobel, the inventor of dynamite, has in his will left \$10,000,000, the yearly interest of which is to be divided annually into five equal portions, two of which will embrace astronomical progress. All the five parts are open to the world. On the basis of 4 per cent. interest each prize will amount to \$80,000. The French Academy are administrators of M. Pierre Lasserre's legacy of 580,000 francs. It is divided into three parts, and the interest of one of them applies to astronomy. Mr. H. Welde, of France, has given 27,000 francs to provide a fund to be devoted to the purpose of founding an annual prize. The award is to be made for the discovery or work in astronomy and physics which in the opinion of the Academy of Sciences shall be the most deserving. Miss Catharine W. Bruén, of New York, has given a sum to the Astronomical Society of the Pacific for the foundation of a gold medal, to be awarded annually, as a recognition of services to astronomy, and to be given to the one judged most worthy, without restriction of race, nationality, or sex. No person shall be twice a recipient.

The Belgian Government has offered a sum of 300,000 francs, without distinction of nationality, to the authors of the best solutions of certain specified problems. Of these, five are in connection with practical astronomy, three prizes being offered for each; nine for problems in theoretical astronomy and physics, for each of which two prizes are offered. A complete list of these problems is given in "Nature" for Feb. 18, 1897.

Lunar Photography.—One of Prof. Dr. Weinek's great enlargements of the lunar crater Maginus has been issued as a specimen plate, giving an idea of what the entire series will be when the work is completed. The scale is that of 10 feet for the entire Moon's diameter in the case of the Lick negatives, and 13 feet in those taken at the Paris and Arequipa observatories.

Solar Eclipses on Jupiter.—An elaborate calculation of these phenomena reveals the fact that in a given point on Jupiter's equator there may be three total eclipses in one day, one in the morning, one at noon, and another in the afternoon, each of the former and latter lasting 21^m 29^s, and the noon eclipse lasting 40^m 58^s. Before and after the noon eclipse occurs two periods of sunshine, each lasting 53^m 45^s. On leaving the equator, the intervals of sunshine diminish, until latitude 16° 40' 33" is reached, when the three eclipses meet, but do not overlap, where the morning and afternoon eclipses will last 43^m 4^s. It is remarkable that for a certain period three fifths of the Jovian day will be turned into night, or, including natural night and totality, nearly all the time shrouded in darkness.

AUSTRALASIA, one of the grand divisions of the globe, consisting of the continent of Australia and island colonies of Great Britain, with intervening islands. With the exception of the Dutch and German portions of New Guinea, the German protectorates of Bismarck Archipelago and the northern Solomon Islands, the French colony of New Caledonia, and the New Hebrides and smaller islands under native rule, all the islands of Australasia are British colonies or dependencies. The five colonies in Australia and New Zealand and Tasmania are self-governing, having each its representative legislature and responsible ministry, disposing of its own revenues, and making all its laws under a charter granted by the British Parliament, subject to a certain reserved veto power of the Imperial Government and the appellate jurisdiction of the Judicial Committee of the British House of Lords in matters of imperial concern. The Crown is represented by a governor in each colony, who as the executive head of the colonial Government acts on

the advice of the responsible ministers, selected from the party or combination that forms the majority in the Legislative Assembly. Fiji is a Crown colony, in which the natives are governed partly by their own chiefs in accordance with their traditional customs.

Area and Population.—The area in square miles of the British Australasian colonies, according to the most recent estimates, and their estimated population on Dec. 31, 1895, are given in the following table:

COLONIES.	Area.	Population.
New South Wales.....	310,700	1,577,870
Victoria.....	87,884	1,117,444
Queensland.....	659,497	400,550
South Australia.....	943,000	352,653
Western Australia.....	975,900	132,050
Tasmania.....	35,385	146,007
New Zealand.....	104,471	203,390
Fiji and Rotuma.....	8,045	121,007
Total.....	3,085,592	4,572,461

* June 30, 1896. † Census of 1891. ‡ Census of 1886.

The movement of population for the several colonies in 1895 was as follows:

COLONIES.	Marriages.	Births.	Deaths.	Excess of births.	Net immigration.
New South Wales.....	8,060	38,775	14,914	23,861	9,717
Victoria.....	7,146	33,706	15,636	18,070	7,687
Queensland.....	2,821	14,874	5,152	9,722	5,678
South Australia.....	2,048	10,537	3,921	6,616	3,727
Western Australia.....	653	2,373	1,004	769	18,394
Tasmania.....	847	4,750	1,811	2,939	1,569
New Zealand.....	4,110	18,346	6,863	11,083	490
Fiji and Rotuma.....	4,228	4,945	4,945	0	0

* Net emigration. † 1894. ‡ Excess of deaths.

During ten years the increase in the population of New South Wales was 288,530, over 82 per cent. of which was the natural increment of the population. The population of New South Wales comprised 685,160 males and 592,710 females. The population of Sydney, the capital, was estimated at 408,500, including suburbs. The arrivals by sea into the colony during 1895 numbered 76,051, and the departures 66,334. The number of Chinamen arriving was 94, while 413 left the colony. Every Chinese immigrant must pay a poll tax of £100. There were 2,563 state schools in 1895, with 4,477 teachers, 216,396 children enrolled, and 139,978 in average attendance. Of 882 private schools, with 51,563 pupils, 286 were Roman Catholic, with 35,162 pupils.

About 55 per cent. of the population of Victoria is urban. Besides Melbourne, the capital, which had 447,565 inhabitants in 1895, there are the towns of Ballarat, with 45,336, Bendigo, or Sandhurst, with 42,381, Geelong, with 24,575, and numerous smaller places. The number of marriages in 1895 was 7,146; of births, 33,706; of deaths, 15,636; excess of births, 18,070. The number of arrivals by sea in 1895 was 81,190; of departures, 88,886. Of the immigrants 55,481 were males and 25,718 females. The excess of emigrants over immigrants, due to departures for Western Australia and other younger colonies, has continued four years, amounting to 6,363 in 1892, 6,413 in 1893, 5,849 in 1894, and 7,687 in 1895. State education is secular and compulsory between the ages of six and thirteen. There were 1,922 state schools in 1895, with 4,483 teachers and 232,052 enrolled pupils, with 134,572 in average attendance. There were besides 867 private schools, with 38,062 scholars. The total cost of public primary education in 1895 was £620,388. The schools are entirely supported by the state.

Of a total population of 393,718 in Queensland

at the close of 1891 the northern district contained 78,077, the central district 46,857, and the southern district 268,784. Of the total 176,971 who lived in Queensland, 17,023 in New South Wales, 2,462 in Victoria, 3,851 in other Australian colonies, 71,187 in England, 43,036 in Ireland, 22,400 in Scotland, and 14,910 in Germany. The number of immigrants in 1895 was 30,066, and of emigrants 24,304. The arrivals of Chinese were 561, and departures 505; arrivals of Polynesians numbered 1,312, and departures 773. The number of marriages in 1895 was 2,821; of births, 14,874; of deaths, 5,152; excess of births, 9,722. There were 738 elementary schools in 1895, with 1,535 teachers and an average attendance of 48,270 pupils, besides which there were 183 private schools, with an average attendance of 10,146 pupils. The cost of the state schools in 1895 was £172,934. Education is made compulsory by statute, but the law is not enforced.

The population of South Australia consisted of 181,161 males and 171,492 females. In the northern territory there was a population of 4,752, of whom 382 were females. Adelaide, the capital, had 144,352 inhabitants. The number of marriages in 1895 was 2,048; of births, 10,537; of deaths, 3,921; excess of births, 6,616. The number of immigrants in 1895 was 36,762, and of emigrants 40,489. Education is free, secular, and compulsory. Public lands are set apart for the support of the schools, of which there were 634, with 59,093 pupils, including 352 provisional schools, in 1895.

The population of Western Australia increased from 29,708 in 1881 to 49,782 in 1891, which was at the rate of 6.75 per cent. a year. In the next five years the increase was 165 per cent. Of the population in 1896 the males numbered 93,704, and the females 38,346. These figures do not include the aborigines, whose numbers can not be estimated, as they live mostly in regions not yet explored. There were 5,670 of them in service with the whites in 1891. The population of Perth, the capital of Western Australia, was estimated at 19,533 in 1895. Of the white population 13.2 per cent. could not read nor write in 1891. Education is compulsory and gratuitous. There were 133 Government schools in 1895, with 4,685 pupils in attendance, and 19 assisted schools, with 1,708 pupils.

The population of Tasmania increased between 1881 and 1891 at the rate of 3.84 per cent. per annum. At the latter date 107,901 of the population were natives of this colony, while 26,975 had come from the British Islands and 7,328 from Australia, and there were 918 Germans and 943 Chinese. Since then about 3,000 more persons have been born every year than have died, but for a part of the time the emigration has exceeded the immigration. Education is compulsory, but still 25 per cent. of the population in 1891 could not read and write. There were 258 elementary schools in 1895, with 19,907 pupils enrolled, and 172 private schools, with 7,073 pupils. The Government expended in that year £35,591 on education.

The population of New Zealand on April 12, 1896, was composed of 371,415 males and 331,945 females. The increase over the preceding year was 2.3 per cent. The district of Auckland, with an area of 25,746 square miles, had 153,564 inhabitants; Taranaki, 3,308 square miles, 31,175; Wellington, 11,003 square miles, 121,854; Hawke's Bay, 4,410 square miles, 34,098; Marlborough, 4,753 square miles, 12,483; Nelson, 10,269 square miles, 35,734; Westland, 4,641 square miles, 14,469; Canterbury, 14,049 square miles, 135,858; Otago, 25,487 square miles, 163,944. The population of the North Island was 340,631; of the South Island, 262,236; of Stewart's island, 352; of Chatham Islands, 234; of Kermadec

Islands, 7. Including Maoris, the total population shown by the census of 1896 was 743,165. There were 3,711 Chinese, of whom 26 were females. Of the Maoris 21,515 were males and 18,290 females. Their number includes 3,501 half-castes living as members of the tribes and 229 Maori wives of European husbands. Of the white population 391,735 resided in the rural districts, 307,294 in boroughs, 950 on adjacent islands, and 3,381 were on board ships. Wellington, the capital, contained 41,758 inhabitants in 1896, including suburbs; Auckland, 57,616; Christchurch, 51,330; and Dunedin, 47,380. The number of immigrants in 1895 was 21,862; of emigrants, 20,967. There were 1,464 primary public schools in 1896, with 3,386 teachers and 129,856 enrolled pupils, of whom 107,222 were in average attendance. Education is free, secular, and in the settled districts compulsory. The Maori schools numbered 69, with 127 teachers, and an average attendance of 2,084 scholars. The private schools, 298 in number, had 770 teachers and 14,659 pupils.

Finances.—The budgets of the several colonies for 1895 and the state of their debts for the fiscal year ending June 30, 1896, in New South Wales, Victoria, Queensland, and South Australia; on March 31, 1895, in Western Australia and Tasmania; on March 31, 1896, in New Zealand; and on Dec. 31, 1895, in Fiji, are shown in the following table:

COLONIES.	Revenue.	Expenditure.	Debt.
New South Wales.....	£9,251,845	£9,886,277	£62,263,473
Victoria.....	6,461,142	6,573,647	46,886,271
Queensland.....	3,641,583	3,567,047	31,873,594
South Australia.....	2,521,400	2,509,498	22,556,025
Western Australia.....	1,438,717	1,212,314	3,988,597
Tasmania.....	761,971	748,046	8,180,925
New Zealand.....	4,107,078	4,370,481	42,271,880
Fiji.....	78,240	76,204	221,087

Of the revenue of New South Wales £1,825,240 came from customs, £271,805 from excise, £318,301 from stamps, £27,658 from the income tax, and £123,109 from licenses, making £2,566,113 derived from taxation, while £2,018,196 came from land, £4,354,821 from services, and £312,715 from miscellaneous sources. Under the head of services is included the revenue from railroads, tramways, and the post office and telegraphs. The expenditure for railroads and tramways, exclusive of expenditure from loans, was £1,884,700; for posts and telegraphs, £746,208; for interest on debt and extinction of loans, £2,525,707; for education, £794,893; for immigration, £547; for other public works and services, £3,934,222. The average rate of interest paid on the debt, including the loan of £4,000,000 raised in October, 1895, was 3.71 per cent. Of the total debt 82 per cent. has been expended on railroads, tramways, telegraphs, water supply, and sewerage, which produce a net return of 3.15 per cent. on the capital outlay. Further loans were authorized for such purposes to the amount of £10,711,148.

Of the revenue of Victoria £2,712,313 were raised by taxation, including £1,809,140 from customs, duties, etc., £308,975 from excise, £120,003 from land tax, £139,084 from duties on estates of deceased persons, £20,774 from a duty on bank notes, £139,000 of stamp duties, £17,328 from business licenses, £17,123 from tonnage dues, etc., and £140,796 from the income tax. The revenue from railroads was £2,583,442; from posts and telegraphs, £509,721; from Crown lands, £473,580; from other sources, £434,096. Of the total expenditure £1,880,196 went to pay interest and expenses of the debt, £1,428,701 for working expenses of railroads, £303,976 for other public works, £652,752 for posts and telegraphs; for Crown lands, etc., £170,789; public instruction, science, etc., £604,109; charitable institutions, etc.,

£255,417; judicial and legal expenditure, £168,806; police and jails, £299,415; customs, harbors, etc., £97,595; mining, £85,696; defense, £194,020; other expenditure, £618,877. Of the total debt the sum of £36,835,005 was borrowed for the construction of railroads, £7,197,506 for waterworks, £1,105,557 for school buildings, and £1,613,702 for other public works.

Of the revenue of Queensland £1,290,795 were derived from customs, £70,417 from excise and export duties, £100,052 from stamps, £52,685 from licenses, £33,063 from the dividend duty, £358,279 from pastoral leases, £195,888 from other rents and sales of land, £1,052,692 from railroads, and £238,115 from posts and telegraphs. The chief expenditures were £1,286,531 for interest of the public debt, £63,138 for endowments of municipalities, etc., £222,850 for public instruction, £166,815 for the colonial Treasurer's department, £640,662 for operating railroads, £296,491 for posts and telegraphs, and £99,491 for the administration of public lands. The expenditure from loans during the year was £392,158, mostly for new railroads, roads and bridges, harbors, telegraphs, waterworks, etc. The sum of £157,192 was paid out for guarantees to sugar works. The estimated total revenue for 1897 is £3,667,940, and expenditure £3,601,500.

The revenue of South Australia is mainly derived from customs, excise, posts and telegraphs, railways, and lands, and the largest part of the expenditure is for the public works and railways, and for interest on the debt. The civil administration, judiciary, police, prisons, and defenses absorb about a third of the revenue. The receipts for 1897 are estimated at £2,563,732, and expenses at £2,590,507. Three quarters of the public debt has been spent in the construction of railroads, telegraphs, and waterworks. The railroads of this colony yield a net return of 3-65 per cent. per annum.

Of the total revenue of Western Australia in 1895 railroads, the post office, and leases of lands produced nearly half, and the rest, £621,825, was derived from customs.

In Tasmania the receipts from customs in 1895 amounted to £304,365. About three fifths of the revenue is derived from taxation, and one fifth from railroads, posts, and telegraphs. Of the expenditure 43 per cent. is for interest, 31 per cent. for public works, 8 per cent. for general administration, 5 per cent. for education and religion, 6 per cent. for charities and sanitation, and 7 per cent. for law and protection. The bulk of the debt pays 4 per cent. interest. The whole of it was raised for public works. The revenue for 1896 was estimated at £768,790, and expenditure at £743,653.

The revenue of New Zealand given above does not include receipts from sales of land, amounting to £196,571 in 1896. Of the ordinary revenue £1,649,310 came from customs, £707,188 from stamps, posts, and telegraphs, £1,182,280 from railroads, £271,399 from land taxes, and £92,778 from the income tax. The land tax rate for 1896 was 1d. in the pound. In addition there is a graduated tax ranging from 4d. on estates worth between £5,000 and £10,000 up to 2d. on land worth £210,000 or over. The rate of the income tax was 6d. in the pound on taxable incomes up to £1,000, the first £300 being exempt, and 1s. in the pound on all higher incomes. The chief branches of the ordinary expenditure were £1,683,773 for the debt, £744,200 for railroads, £453,156 for education, £338,836 for posts and telegraphs, and £196,999 for constabulary and defense. The ordinary revenue for 1897 is estimated at £4,699,558, including a surplus of £215,558 carried over, and the expenditure at £4,452,165, leaving an estimated surplus of £247,393. The total expenditure out of the public works

fund, including expenses of raising loans, from 1870 to 1896, was £29,954,651.

Commerce and Production.—The value of the foreign and intercolonial trade of the different colonies in 1895 is shown in the following table:

COLONIES.	Imports.	Exports.
New South Wales.....	£15,502,415	£21,554,585
Victoria.....	12,472,844	14,541,732
Queensland.....	5,349,047	9,582,600
South Australia.....	5,286,601	7,177,096
Western Australia.....	3,774,561	1,332,554
Tasmania.....	1,094,457	1,373,663
New Zealand.....	6,400,129	8,550,224
Fiji.....	241,750	232,309

There were 1,348,600 acres under cultivation in New South Wales in 1896, producing 5,195,312 bushels of wheat and 5,687,030 bushels of corn, besides barley, oats, potatoes, lucerne, and hay. There were 1,231 acres planted to tobacco; 32,927 acres to sugar cane, yielding 207,771 tons of raw sugar; 7,519 acres to the vine, yielding 885,673 gallons of wine and 7,149 gallons of brandy; and 11,956 acres to oranges, yielding 5,954,940 dozen. There were 47,617,687 sheep, 2,150,057 cattle, 487,943 horses, and 221,597 pigs in the colony in 1896. The quantity of wool exported in 1895 was 329,992,675 pounds, valued at £9,976,044. The value of the gold produced in 1895 was £1,315,929; of silver, £81,858; of silver-lead ore and metal, £1,560,813; of coal, £1,005,327. The export of tallow in 1895 was £1,102,145 in value; of coal, £773,954; of hides and skins, £294,466; leather, £294,708; preserved and frozen meat, £695,504; gold coin, £2,710,560. Of the total imports £6,420,107 came from the United Kingdom, £7,321,668 from the other Australasian colonies, £611,021 from other British possessions, £624,268 from the United States, and £1,015,351 from other foreign countries. Of the total exports £9,371,418 went to the United Kingdom, £7,590,965 to the other Australasian colonies, £360,702 to other British possessions, £683,606 to the United States, and £3,928,073 to other foreign countries. The value of home produce exported was £16,436,210, and of foreign exports £5,498,575. The foregoing figures relate to sea-borne commerce only. The overland imports amounted to £1,783,368, and exports to £4,748,129.

The cultivated area in Victoria was 2,864,000 acres in 1896. The production of wheat was 5,668,000 bushels, an average of only 4 bushels to the acre; of oats, 2,879,000 bushels. Vines covered 30,712 acres. There were 431,547 horses, 1,833,900 cattle, 13,180,943 sheep, and 337,588 pigs in the colony in 1895. The value of the gold output of 1895 was £2,960,344. There were 29,897 miners working in the gold fields, of whom 2,014 were Chinamen. The number of hands employed in manufactories was 41,273. The tariff duties average 15 per cent. of the value of imports. The imports of wool were £2,367,915 in value and exports £5,151,153. The exports of gold and specie were £3,570,737; of live animals, £294,886; of leather, leathern cloth, and articles made of leather, £285,194; of breadstuffs, £629,960; of refined sugar, £82,554; of apparel, £105,592; of tallow, £249,904; of all other articles, £3,997,801. Of the total imports £4,759,346 came from the United Kingdom, £5,800,710 from Australasian colonies, £215,258 from India, £113,719 from Ceylon, £16,669 from Canada, £253,419 from other British possessions, £359,680 from the United States, £343,371 from Germany, £132,527 from France, £130,825 from China, £93,769 from Belgium, £96,743 from Java and the Philippines, £79,675 from Sweden and Norway, and £74,443 from other countries. Of the exports £8,068,121 went to the United Kingdom, £4,461,638 to

Australasian colonies, £150,930 to Ceylon, £99,859 to India, £10,406 to Canada, £103,275 to other British possessions, £560,098 to Germany, £320,003 to Russia, £281,394 to the United States, £224,122 to France, £18,636 to Java and the Philippine Islands, and £149,250 to other countries.

About half the area of Queensland is forest. Of the total area 12,453,840 acres have been alienated and 1,757,755 acres are in process of alienation, leaving 413,626,485 acres still owned by the state. The receipts from land up to the end of 1895 were £7,543,460. A large proportion of the area is leased for pastoral purposes under the law of 1884 allowing 20,000 acres or less to be selected on a lease for thirty years. The same act provides for the selection of agricultural land up to the maximum of 1,280 acres on a lease running fifty years, with the privilege of purchasing it under certain conditions. There were 3,339 pastoral runs in 1895, aggregating 261,882,426 acres. The live stock of the colony comprised 468,743 horses, 6,822,401 cattle, and 19,856,959 sheep. The cultivated area was 299,278 acres. The corn crop was 2,391,378 bushels in 1895. There were 77,247 acres under sugar cane. The gold product of 1895 was 631,682 ounces. Tin was produced of the value of £68,133; copper, £13,097; silver, £30,042; opals, £32,750; coal, £123,530. The chief exports in 1895 were gold, of the value of £2,272,109; copper, £31,324; wool, £2,991,413; sugar, £796,117; hides and skins, £456,506; tin, £74,187; silver, £48,379; tallow, £595,992; pearl shells, £71,856; preserved and salted meat, £402,480; frozen meat, £583,409; meat extract, £42,791; green fruit, £58,555. The trade is chiefly with Great Britain and the other Australian colonies. The imports from the United States were valued at £130,885.

In South Australia there were 2,625,741 acres cultivated in 1893, of which 1,732,711 acres were under wheat. The wheat crop of 1894 was 13,618,062 bushels. The live stock consisted of 187,666 horses, 323,602 cattle, and 7,267,642 sheep in 1895. There were 112,762 square miles leased in pastoral runs. There was £266,494 worth of copper produced and exported in 1895. The export of wool in 1895 was £1,438,776; of wheat, £445,461; of flour, £392,974. The imports from the United States were £241,886 in value; exports to the United States, £14,439.

In Western Australia agriculture and stock raising have made great progress, as well as mining. The land under cultivation in 1895 was 218,239 acres, a minute fraction of the surface of the colony, which embraces 624,588,800 acres. The live stock comprised 58,506 horses, 200,091 cattle, and 2,295,832 sheep. The chief crop is wheat, of which 8 bushels are raised to the acre. There are silver, copper, lead, tin, and coal mines, as well as gold mines. The gold export increased from £226,284 in 1892 to £421,385 in 1893, £787,094 in 1894, £479,748 in 1895, and £1,008,808 in 1896. The export of pearls in 1895 was valued at £20,000; pearl shells, £27,298; sandalwood, £30,863; timber, £88,146; wool, £183,510; skins, £18,941.

In Tasmania the land sold or granted to settlers amounts to 4,711,974 acres. The unalienated land, embracing 10,860,426 acres, not counting 1,206,500 acres of lakes and islands, is mostly heavily timbered and contains valuable minerals. The area under crops in 1896 was 212,703 acres; under grasses, 221,970 acres; leasage sheep runs, 630,635 acres; planted with fruit trees, 11,037 acres. The yield of wheat in 1896 was 1,164,855 bushels, 18 to the acre; of oats, 906,934 bushels, 27 to the acre; of potatoes, 81,423 tons, 4·23 to the acre; of hay, 62,345 tons, 1·14 to the acre. Large quantities of fruit are exported. There were 510,387 bushels of apples gathered. The hop product was 543,650

pounds. The live stock consisted of 31,580 horses, 162,801 cattle, 1,523,846 sheep, and 70,142 hogs. The colony is rich in gold, iron, tin, copper, silver, lead, and coal. The export of gold in 1895 was £218,308; of silver, £227,916; of tin, £167,754; of timber and bark, £65,125; of wool, £202,341; of hops, £18,210; of green and preserved fruit, £161,464.

Of 66,710,320 acres, the total area of New Zealand, 21,131,251 acres had been alienated up to April, 1895. About two thirds of the surface of the island is suitable for agriculture and grazing. About 20,000,000 acres remain under forest and 9,000,000 acres are barren mountain, lakes, and waste lands. There were 9,285,170 acres sown to grasses in 1896, and a total area under crops of 10,698,809 acres. The public lands leased for pastoral purposes amounted to 12,469,976 acres. The wheat crop of 1896 was 6,644,000 bushels, averaging nearly 28 to the acre. Of oats, 12,264,000 bushels were grown, over 33 to the acre. The live stock consisted of 237,418 horses, 1,047,901 cattle, 18,982,080 sheep, and 239,778 pigs. The values of the principal exports in 1895 were: Wool, £3,662,131; frozen meat, £1,262,711; gold, £1,162,181; butter and cheese, £378,510; hides, skins, and leather, £382,254; Kauri gum, £418,766; tallow, £260,999; grain and flour, £218,996; timber, £141,892; preserved meat, £66,137; grass seed, £64,112; New Zealand hemp, or phormium, £21,040; live animals, £37,256; hams and bacon, £6,450. The export of wool was 144,295,154 pounds; of frozen meat, 1,025,243 hundredweight; of butter, 60,771 hundredweight; of cheese, 55,655 hundredweight; of Kauri gum, 8,338 tons.

Of the total imports, £3,992,359 came from the United Kingdom, £1,261,125 from Australian colonies, £394,223 from the United States, £282,571 from Pacific islands, £233,135 from India and Ceylon, £38,664 from China, £12,474 from Mauritius, and £185,578 from other countries. Of the exports £7,045,646 went to the United Kingdom, £1,035,753 to Australia, £316,639 to the United States, £125,643 to Pacific islands, and £26,543 to other countries.

Navigation.—There were 3,121 vessels, of 2,929,758 tons, entered during 1895 at the ports of New South Wales, 2,900, of 2,604,664 tons, being British and 221, of 325,094 tons, foreign. The total number cleared was 3,090, of 2,930,280 tons, of which 2,881, of 2,610,510 tons, were British and 209, of 319,770 tons, foreign. The shipping registered in the colony comprised 479 sailing vessels, of 54,222 tons, and 485 steamers, of 57,820 tons, having been increased during the year by 13 sailing vessels, of 1,363 tons, and 13 steamers, of 5,172 tons.

The number of vessels entered at Victorian ports during 1895 was 1,948, of 2,181,539 tons, of which 408, of 885,839 tons, were British, and 1,440, of 1,065,234 tons, were colonial; the number cleared was 1,889, of 2,167,147 tons, of which 398, of 876,468 tons, were British and 1,390, of 1,061,925 tons, colonial. The shipping registered in the colony consisted of 261 sailing vessels, of 41,925 tons, and 153 steamers, of 48,029 tons.

In Queensland 584 vessels, of 469,710 tons, were entered and 634, of 502,195 tons, cleared during the year. The shipping of the colony consisted of 137 sailing vessels, of 10,780 tons, and 92 steamers, of 12,415 tons, including river steamers.

There were 1,106 vessels, of 1,483,440 tons, entered and 1,110, of 1,496,203 tons, cleared at South Australian ports. The shipping of this colony consisted of 95 sailing vessels, of 17,715 tons, and 214 steamers, of 22,930 tons. In Western Australia 485 vessels, of 814,368 tons, were entered and 433, of 764,185 tons, cleared in the course of 1895. The

vessels on the register of the colony were 11 steamers, of 3,504 tons, and 144 sailing vessels, of 4,770 tons. At the ports of Tasmania 711 vessels, of 463,979 tons, were entered and 742, of 473,546 tons, cleared in 1895. The colonial merchant fleet consisted of 162 sailing vessels, of 10,000 tons, and 51 steamers, of 8,159 tons. The number of vessels entered at the ports of New Zealand in 1895 was 611, of 672,951 tons, of which 579, of 636,722 tons, were with cargoes; the number cleared was 597, of 648,946 tons, of which 554, of 622,311 tons, were with cargoes. Of the number entered 146, of 209,667 tons, were British, 420, of 319,313 tons, colonial, and 45, of 53,971 tons, foreign. The vessels registered in the colony consisted in 1895 of 299 sailing ships, of 35,925 tons, and 180 steamers, of 38,856 tons.

Railroads, Posts, and Telegraphs.—The length of railroads in operation in New South Wales on June 30, 1896, was 2,531 miles, costing £36,852,194 to build and equip. The receipts for the year were £2,820,417, and the working expenses £1,551,888, being 55.02 per cent. of the gross earnings. There were besides 84 miles of private railroads.

The railroads of Victoria, all belonging to the state, had in 1895 a length of 3,103 miles, built at a cost of £37,909,626. The receipts in the fiscal year 1895 were £2,581,591, and the operating expenses £1,543,393, giving a net return of 2.75 per cent. on the capital, which was borrowed at the mean rate of 3.91 per cent. per annum. There were 40,250,000 passengers and 2,435,857 tons of freight carried in 1895.

In Queensland there were 2,379 miles of railroad open for traffic at the end of 1895, all belonging to the Government and built at a cost £16,603,427. Including loan expenses the cost was £18,458,536. The receipts for 1895 were £1,048,634, and expenses £208,709.

South Australia had 1,888 miles of railroads in 1895, of which 146 miles were in the northern territory. The railroads pay a net profit of 5 per cent. to the Government.

In Western Australia there were 1,164 miles of railroads open for traffic at the end of 1895, when 115 miles were building and 283 miles being surveyed.

Tasmania had 475 miles of railroad at the close of 1895.

The railroads of New Zealand had on April 1, 1896, a total length of 2,189 miles, of which 775 miles were on the North island and 1,239 miles on the South island. The latter figure includes 175 miles of private lines. The receipts of the Government railroads for the year ending March 31, 1896, were £1,183,041, and the expenses £751,368. The cost of construction was £16,328,964. There were 4,162,426 passengers and 2,087,798 tons of freight carried during the year.

The postal traffic of New South Wales for 1895 was 68,079,000 letters, 957,400 postal cards, 44,902,900 newspapers, 11,259,300 packets and book parcels, 422,772 parcels, and 406,235 money orders for the total amount of £1,269,200. The postal revenue of Victoria in 1895 was £509,721, including receipts from telegraphs and telephones, and the expenses were £652,752. In Queensland 18,278,870 letters, 11,885,858 newspapers, 4,834,453 packets, and 134,603 parcels were carried. The post office of South Australia forwarded 17,073,913 letters, 2,129,994 packets, and 8,723,501 newspapers. The Western Australian post office in 1895 handled 17,867,952 ordinary letters, 273,615 registered letters, 17,906,387 newspapers, and 4,079,368 packets. The number of letters passing through the Tasmanian post office in 1895 was 5,892,376; of postal cards, 202,-

332; of newspapers, 4,506,191; of packets, 1,354,551. The revenue of the post office alone was £55,876; of the telegraph and telephone service, £14,939; expenses of the department, £61,927. The postal traffic of New Zealand in 1895 was 28,949,936 letters, 637,013 letter cards, 1,391,633 post cards, 11,023,330 books and parcels, 12,675,973 newspapers, and 243,497 money orders issued and 183,965 paid; receipts of posts and telegraphs, £365,727; expenses, £362,325.

The telegraph lines of New South Wales had a length of 12,316 miles at the end of 1895, with 28,799 miles of wire, erected at a total cost of £840,380. The number of messages for that year was 2,635,456. The receipts were £367,316, being £145,901 over the expenses, but the Post Office Department as a whole took in £647,845 only and spent £758,130. Victoria in 1895 had 7,091 miles of lines, with 14,409 miles of wire. The number of dispatches sent during the year was 2,033,630, paying £95,896. The telegraphs of Queensland had a total length of 9,979 miles, with 17,790 miles of wire. There were 853,156 messages sent and 112,952 foreign messages received, besides 89,507 official messages. The receipts from telegraphs were £76,011, and the postal revenue was £158,082, while the expenses of the department were £295,065. South Australia had 5,620 miles of telegraph, with 13,473 miles of wire. There is an overland line connected with the British Australian cable crossing the continent from Port Darwin to Adelaide, 2,000 miles. The Government earns a profit on its telegraphs above running expenses and interest charges.

The telegraph lines in 1895 had a length of 4,577 miles in Western Australia, where 240 miles were being added. There were 720,992 messages sent during the year. The net revenue was £61,673, the total expenses of telegraph service and post office being £108,578. The telegraphs of Tasmania had a length of 1,789 miles, with 3,004 miles of wire, besides 422 miles of cable and 520 miles of telephone wire. The number of dispatches in 1895 was 190,277. The length of the New Zealand telegraphs on March 31, 1896, was 6,245 miles, with 15,764 miles of wire. The number of messages during the year was 2,124,211, of which 1,899,632 were private messages, paying £92,389.

Australian Federation.—At the conference of premiers held at Hobart in February, 1895, it was agreed to dispense as far as possible with the necessity for further parliamentary action in relation to the federal movement, and to appeal by popular election directly to the voters of each colony. But to give validity to the proposed elections, it was necessary first to obtain parliamentary sanction to the scheme in several colonies. For this purpose each colonial parliament was asked to pass an enabling bill. The same difficulty that had been experienced in connection with the draft commonwealth bill of 1891 as to harmonious action on the part of six parliaments was again felt in regard to the passing of the enabling bills. After two years' delay the colony of Queensland had for local reasons still failed at the beginning of 1897 to pass the enabling bill. The necessary legislation had been carried through all the other parliaments, though with a slight departure in Western Australia from the purely popular programme adopted at the Hobart conference. All the Australian colonies, Queensland excepted, were ready at the beginning of 1897 to take action on the bills that had been passed. The lead in the matter was accorded by common consent to New South Wales. A proclamation was issued in that colony by which the enabling act was brought into force on Jan. 4, and after a consultation between the premiers of the principal colonies, from which Western Australia

at first abstained, it was agreed that writs for the elections to the federal convention should be issued on Jan. 20, that nominations should be received until Feb. 11, that the elections should be held on March 4, and that the convention should meet on March 29. Western Australia at first refused to join, but at the last moment decided to take part and to hold its elections on March 13. The enabling act passed in each colony in practically identical terms took the matter henceforth out of the hands of the parliaments. It provided that the convention charged with the task of framing the federal constitution should consist of 10 representatives from each colony elected by the voters for the Legislative Assembly. When three or more colonies should have elected their members to the convention, it devolved upon the governors of those colonies to summon the convention. After framing a constitution the convention was to adjourn for at least thirty, but not more than sixty days, to enable the constitution to be criticised. After the adoption of the constitution by the convention, it was to be referred to the direct vote of the electors for acceptance or rejection. If three colonies accepted the constitution, it should be presented for imperial enactment by the British Parliament. The convention possessed a groundwork for its labors in the comprehensive commonwealth bill framed by the Sydney convention of 1891 after six weeks of deliberation. In that convention Queensland took part, and the scheme of federation drawn up there was in great part the work of the Chief Justice of that colony, Sir Samuel Griffith. New Zealand was also represented at Sydney, but even then showed no strong bent for uniting with the Australian colonies separated from it by 1,200 miles of sea. The elections of delegates to the new federal convention were governed in Victoria and New South Wales largely by the consideration of state rights. The commonwealth bill of 1891 proposed that the Federal Parliament should consist of two houses, of which the lower was to represent the population of Australia, and the upper was to represent the states. State rights were fully guaranteed by the provision that each state was to be represented by 8 senators, each senator to have one vote. Thus every state, small or great, was to have equal power in the Senate, while for the lower house the representation was to be proportioned to population, each state having a representative for every 30,000 inhabitants. The smaller colonies insist strongly on equal state rights, which they regard as the only guarantee that they will not be swamped in the Federal Parliament by the greater representation in the lower house of the more populous colonies. The great colonies of New South Wales and Victoria, on the other hand, demur to an arrangement that will enable Western Australia, South Australia, and Tasmania in combination to outvote them in the Senate. A federal council met at Hobart on Jan. 27 to consider joint action by the colonies to celebrate the sixty years' reign of Queen Victoria, trade relations between Great Britain and Australia, the New Hebrides question, federal quarantine stations, and uniform bank laws. The Victoria delegates deprecated proceeding with business of importance in view of the early meeting of the federal convention. The Queensland and Western Australia delegates strongly opposed inaction, predicting that the labors of the convention would prove abortive. Finally it was decided to proceed with the business. The conference discussed Mr. Chamberlain's suggestion of a Zollverein, but were unable to determine whether it involved free trade within the empire or lower duties on British as compared with foreign goods. The Australian premiers here, and

later in London, declared generally in favor of preferential duties on British goods on condition of a like protection of Australian products in the British market. The delegates to the federal convention were elected in the five colonies of New South Wales, Victoria, South Australia, Western Australia, and Tasmania. In New South Wales and Victoria several delegates were elected on a platform of state rights. The Victorian delegates held a meeting with a view of coming to an agreement on debatable questions, but they decided to go to the convention free to vote at their individual discretion.

The convention met on March 22 at Adelaide, the central capital between Sydney and Perth. An amendment to allow women to vote for members of the House of Representatives was rejected by a vote of 23 to 12. On the questions of state rights and federal finance widely divergent opinions were expressed. As the debate did not lead to a satisfactory agreement, the convention adjourned till September, when it was hoped that Queensland would also be represented. The Queensland ministry proposed to the Parliament to authorize the election of delegates to the September convention, but the bill was defeated.

The second federal convention assembled at Sydney early in September.

In the interval all the colonial parliaments had discussed amending bills to the commonwealth act, and the results of their deliberations were laid before the Sydney convention to serve as a guide to the framing of the final federal constitution. In the spring convention it was proposed that the Senate should control money bills, and this was carried by the votes of South Australian, Western Australian, and Tasmanian delegates against those of New South Wales and Victoria. It was decided that amendments to the federal constitution, after passing both houses, should be submitted to a referendum. Sir George Turner proposed that deadlocks in the Legislature should also be settled by the popular referendum, but this was negatived. The New South Wales Assembly proposed various amendments of a democratic nature to the constitution which the convention had framed on conservative lines in close imitation of constitutional precedents. The Senate, instead of being a permanent body, re-elected at intervals in segments, it was proposed to make dissolvable at any time by the Governor at the advice of the ministers—that is, at the dictation of the House of Representatives. Equal representation in the Senate of each state was pronounced unacceptable to New South Wales, and a plan of proportional representation on the basis of population was proposed, with popular election of the senators in separate election districts. All money bills, including those that fix fees or salaries as well as taxation and appropriation bills, must originate in the House of Representatives. In case a difference should arise between the two chambers, the referendum would settle it. Judges were to be removable by address from both houses. Constitutional amendments would require only a majority vote of the people of the whole commonwealth, not of each state. The parliaments of the smaller colonies—South Australia, Tasmania, and Western Australia—insisted on equal representation in the Senate of all the states, large or small. The Victorian Assembly conceded this. The Adelaide convention gave the Senate power to reject bills imposing taxation, but the question of the right of amending such bills was compromised, a small majority deciding that the Senate should only have power to suggest amendments to the House of Representatives by message. This compromise the parliaments of the

smaller colonies rejected, desiring that the Senate should have full power to amend. The assemblies of Victoria and New South Wales, on the other hand, wished to deprive the Senate of even the right to suggest amendments. The problem of how to surmount deadlocks between the houses was left by the Adelaide convention without a solution. The assemblies of Victoria and New South Wales suggested three methods of settling such disputes: By the simultaneous dissolution of both houses; by a clause providing that if the bill should be passed a second time by the House of Representatives and the Senate should again reject it, the latter should be dissolved; or by the decision of the people in the form of a referendum in case a bill has been twice passed by one house and twice rejected by the other. The Adelaide convention adopted an elaborate scheme for the distribution among the states of the surplus revenue of the commonwealth derived from the uniform federal tariff that would be adopted. The colonial treasurers of New South Wales and Victoria attached great importance to the scheme, but the others thought that the question ought to be left to the commonwealth Parliament. The Victorian Legislative Council offered few and unimportant amendments, but the Council of New South Wales, led by the Attorney-General, voted for numerous and drastic changes in the draft constitution as it issued from the Adelaide convention, being actuated by the confessed purpose of wrecking the bill. The very word "federal" was struck out of all the clauses, and the commonwealth Parliament was deprived of the power of imposing duties or taxes of any kind or of raising revenue by any means. In view of the serious character of many of the parliamentary amendments, the prospects of federation were not regarded as favorable when the Sydney convention came together at the beginning of September. Sir George Turner proposed adjournment for a year in order to give the colonies opportunity for further discussion and to enable Queensland to be represented. Sir Samuel Griffith, Chief Justice of Queensland, wrote to urge adjournment. When the enabling bill was introduced in the Queensland Assembly it was expected that it would pass without opposition, and as soon as an amendment was proposed the minister withdrew the measure. After the Federal Convention assembled in Sydney the Queensland Assembly requested it not to conclude its labors until Queensland was represented by a direct vote of the people. A motion providing for the election of delegates by popular vote in the same manner as in the other colonies was finally carried in the Queensland Assembly on Sept. 16 by the majority of 34 to 8. The other parliaments that placed obstacles in the way of the scheme of federation adopted at Adelaide were not fairly representative of the people on the subject of federation, which was expressly intrusted to the delegates to the convention elected by the direct vote of the people. It was therefore expected that the commonwealth bill, as finally elaborated at Sydney, would meet no further opposition in the parliaments if it proved acceptable to the people of the several colonies and received a large majority of their votes when submitted to their decision.

The second session of the Federal Convention opened at Sydney on Sept. 2, and, in response to the request of the Queensland Government that Queensland should be represented in the convention before the commonwealth bill was finally adopted, adjourned on Sept. 24 until January, 1898, when a third session was to be held at Melbourne. The convention rejected the principle advocated by New South Wales of proportional representation in

the Senate as well as in the House of Representatives, which would give the larger colonies an overwhelming majority in both houses and place the destinies of the smaller states in all federal questions in their hands. By a majority of 41 votes to 5 it was decided to give all states, large or small, equal representation in the Senate. It was moreover decided that the members of the Senate should be elected by each colony voting as one electorate. In the case of new states entering the federation, however, representation shall not necessarily be equal. A proviso favoring female suffrage was negatived. The delegates of the smaller colonies, after being helped to their decisive victory on the question of equal representation in the federal Senate, were expected to make concessions to the larger colonies on the question of limiting the powers of the Senate in regard to money bills and in the matter of providing against deadlocks. A number of them proved themselves accommodating by rejecting the proposal of Sir John Forrest, Premier of Western Australia, to give the Senate full power to amend money bills, which was lost by 39 votes to 29. Even the compromise that was adopted at Adelaide in order to save the commonwealth bill was now dropped, and it was decided that the popular house should have sole control over the finances of the commonwealth. On the question of the best method of dealing with or averting deadlocks between the houses, which the Adelaide convention left undetermined, strong diversity of opinion was disclosed. Victorian delegates were disposed to support the proposal of a referendum emanating from New South Wales, but since this would place the Senate ultimately under popular control the smaller colonies objected to this system as tending to nullify state rights. Most of the delegates were in favor of a simultaneous dissolution of both houses and were willing to adopt a dual referendum, requiring a majority of states and a majority of the people to agree on the subject referred. Another proposal was that the lower house should be dissolved, and if the disputed bill was passed a second time after an appeal to the country and a second time rejected by the Senate, that the Senate should then be dissolved. The proposed dual referendum seemed farcical to Sir John Downer, of South Australia, and a monstrous absurdity to Mr. Reid, of New South Wales. Josiah Symons, of South Australia, proposed the dissolution of the Senate in the event of its rejecting a measure passed by the lower house after an appeal to the country, and this was accepted by the narrow majority of 5 votes. Amendments providing for a referendum in the event of the further rejection of the same bill by the newly elected Senate for a dual referendum, for allowing the Government a choice between dissolution and a referendum, for the dissolution of the house that had been longest elected, for a joint vote on the disputed measure by both houses, were rejected in succession, and after a long and heated debate the convention finally accepted a compromise suggested by Mr. Wise, of New South Wales. This provides that in case of deadlock both houses shall be simultaneously dissolved, and a further amendment proposed by Mr. Carruthers, of New South Wales, provides that in the event of the double dissolution proving insufficient the matter in dispute shall be decided by a three-fourths' majority of both houses sitting together. Financial questions were left to be dealt with by the Melbourne convention. Though the view prevailed in the colonial parliaments that the distribution of surplus revenue should be left to the future consideration of the Federal Parliament, it was decided to refer the question to a finance committee for special consideration and report.

New South Wales.—The Parliament consists of a Legislative Council of 66 members, appointed for life, and a Legislative Assembly, of 125 members, elected in separate districts for three years by restricted suffrage. The number of registered electors in July, 1895, was 267,438. The Governor is Viscount Hampden, appointed in 1896. The Cabinet at the beginning of 1897 was composed as follows: Premier, Treasurer, and Minister for Railways, George Houston Reid; Chief Secretary, James Nixon Brunker; Attorney-General, John Henry Want; Secretary for Lands, Joseph Hector Carruthers; Secretary for Public Works, James Henry Young; Minister of Public Instruction and of Labor and Industry, Jacob Garrard; Postmaster-General, Joseph Cook; Secretary for Mines and Agriculture, Sydney Smith; Minister of Justice, Albert John Gould; Vice-President of the Executive Council and Representative of the Government in the Legislative Council, Andrew Garran.

When all the Australian premiers went to England to take part in the Queen's jubilee a tacit truce was agreed to, in accordance with which no serious legislative proposals of a controversial nature were put forward by the acting premiers, and no attempts to overturn the ministries were made by the Opposition. Mr. Brunker, who filled the place of the Premier of New South Wales, encountered difficulties in connection with the collection of land and income taxes, though on the whole the revenue returns were satisfactory, showing a total revenue of £9,309,000 and an increase of £57,000 over 1896, strengthening, on the whole, the free-trade policy of the Government. The session of Parliament was opened in April. One of the laws passed abolishes the payment of school fees.

Victoria.—The Legislative Council has 48 members, elected under a property qualification, and the Legislative Assembly 95 members, elected by universal adult male suffrage. There were 138,393 electors for the former and 247,730 for the latter on the roll in 1896. The Governor is Lord Brassey, appointed in 1895. The Cabinet was composed as follows at the beginning of 1897: Premier and Treasurer, George Turner; Chief Secretary and Minister of Public Instruction, A. J. Peacock; Attorney-General, Isaac Isaacs; Solicitor-General, H. Cuthbert; Commissioner of Trade and Customs, President of the Board of Land and Works, and Commissioner of Crown Lands and Survey, R. W. Best; Postmaster-General, J. G. Duffy; Minister of Defense, W. McCulloch; Minister of Mines and Water Supply, H. Foster; Minister of Agriculture and Commissioner of Public Works, J. W. Taverner; Minister of Railways and Minister of Health, H. R. Williams; Ministers without portfolios, A. McLean, David Courtis, and S. Williamson.

The recovery from former depressed conditions was more marked in 1897 than in any previous year. The clearing-house returns were much larger. The banks paid up a large share of the deferred deposits due since the Australian banking crisis. The coin deposits exceeded any sum previously recorded, amounting to £8,900,000 in January. Later there were heavy shipments of gold, especially after imports of wheat set in from the United States. The production of gold has been stimulated in all the Australian colonies. The yield in Victoria during 1896 was 84,000 ounces above that of 1895. There were new alluvial mines discovered near the New South Wales border, and auriferous rock in several new districts. The output for 1897 promised to exceed any previous yield for twenty years. The revenue of Victoria for 1897 amounted to £6,600,000, an increase of £170,000. The increase in railways was £200,000, and in customs £25,000. The question of meat exports

has occupied the attention of the public authorities as well as the producers in several colonies. The exporters of Victoria, in a conference with Mr. Taverner, the Minister of Agriculture, agreed that the state should supervise and control all meat exports in order to insure their perfect condition. A bill was passed providing for Government inspection, grading, and branding of butter, meat, rabbits, poultry, and fruit exported from the colony. This was the result of an agreement with the other Australian governments, which promised similar legislation on exported produce from all the colonies. A trial shipment of Victorian tobacco was considered by the Government expert to be equal to the American leaf. The Parliament opened in the middle of June, and closed at the end of August to enable the delegates to attend the second federal convention. The principal business besides the budget estimates was the consideration of the federal bill made necessary in all the colonies by the dissolution of the Adelaide convention. One of the new labor laws of Victoria forbids working before seven in the morning or after five in the evening. The new factories act authorizes joint boards of employers and employed to fix a minimum wage for each trade. The Labor party has pressed for a State bank, reform of the Council, taxation of unimproved land, and a referendum. By his new programme, presented to Parliament in September, Sir George Turner appealed to the moderate politicians, breaking away from the Labor leaders with whom he has been in alliance.

Queensland.—The Legislative Council consists of 39 members, appointed for life, and the Legislative Assembly of 72 members, elected by universal adult male suffrage. There were 86,878 registered electors at the end of 1895. The Governor of Queensland is Lord Lamington, appointed in 1895. The Cabinet in the beginning of 1897 was composed as follows: Premier, Vice-President of the Executive Council, Chief Secretary, and Treasurer, Sir Hugh Muir Nelson; Minister for Lands, J. F. G. Foxton; Postmaster-General and Secretary for Agriculture, A. J. Thynne; Secretary for Mines and for Railways, Robert Philp; Secretary for Public Instruction and for Public Works, D. H. Dalrymple; Home Secretary, H. Tozer; Attorney-General, T. J. Byrne; Ministers without portfolios, W. H. Wilson, Sir Thomas Mellwraith, and A. H. Barlow.

Queensland alone of the Australian colonies suffered a decline in its revenue in 1897, the total receipts being £3,613,200, or £28,400 less than in 1896. The industrial conditions, however, were not altogether unfavorable, though the pastoralists sustained losses due to the tick plague and agriculture suffered from drought. The sugar industry, according to the report of the Land Commission, was holding its own notwithstanding adverse conditions, and counted an export for the year of upward of 70,000 tons. The coffee and tobacco industries promised well, and there was a hopeful tendency in the mining interest as well as in agriculture. The output of gold was estimated for the year at £2,500,000. The legislative session began in the latter half of June. Owing to the absence of the Premier in England nothing of importance was transacted. A moderate and economical policy in extending the main railroad lines was proposed. The Premier conferred with the other colonial premiers in London with a view to providing against Asiatic immigration and concerning the administration of New Guinea and the Solomon Islands. A committee appointed to study the question of a Pacific cable unanimously affirmed the practicability of the scheme. Experienced colonists have been sent by the Government to England, the Con-

continent of Europe, and America to lecture on the advantages of emigration to Queensland. Sir Hugh M. Nelson, the Premier, is desirous of amending the stringent mining laws by accepting the expenditure of money on machinery as a test of the good faith of the lessee in lieu of requiring the employment of a man on every acre, also by abolishing the dividend tax and by allowing a company to have only one shaft for two or more adjacent claims.

South Australia.—The Legislative Council contains 24 members, elected for nine years by property holders. One third of them retire every three years, and each of the 4 electoral districts elects 2 new members to succeed them. In 1894 the franchise was extended to women. The House of Assembly consists of 54 members, elected for three years by manhood suffrage, 2 for each assembly district. The number of registered voters in 1895 was 137,778. The Governor is Sir Thomas Fowell Buxton, appointed in April, 1895. The Cabinet at the beginning of 1897 was composed as follows: Premier and Attorney-General, C. C. Kingston; Chief Secretary, J. V. O'Loughlin; Treasurer, F. W. Holder; Commissioner of Lands, L. O'Loughlin; Commissioner of Works, J. G. Jenkins; Minister of Education and Agriculture, J. A. Cockburn.

The position of Mr. Kingston's Government was somewhat weakened by the results of the elections in June to the Legislative Council, which gave a majority to the Opposition in that house. The Opposition in the lower house underwent also a reorganization under its new leader, Sir John Downer. These facts and the absence of the Premier deterred the Government from making any startling proposals when the session opened in June. The Railway Commissioners had an ambitious scheme to offer of important bearing on the development of the internal trade and communications of the Australian continent and of the export trade as well. This is a project for the construction of a connecting line of railway 1,000 miles long between South and West Australia, which would complete the railway circuit from Perth to Brisbane and bring Western Australia into easy communication with the other colonies. Mr. Holder, the acting Premier, laid the project before Mr. Wittenoom, who was filling that capacity in West Australia, and inquired if West Australia was prepared to undertake the construction of the part of the line crossing its territory. This the authorities of the vigorous young western colony would not promise, and hence this project, the cost of which is too great to be fairly borne by the two colonies alone, remains to be achieved by the future federated Australia. The proposed line, which will shorten mail communications between Australian cities and the outer world by two full days, will some day be as important for strategic as for commercial considerations. The revenue of New South Wales for 1896-'97 showed an increase of £44,000 over the previous year, and reached a total of £2,600,000. The increase in customs revenue was £23,000.

Western Australia.—The Legislative Council contains 21 members, 3 for each electoral district, elected for six years by holders of a certain amount of real property. The Legislative Assembly consists of 45 members, elected in separate districts for four years under a property qualification also, about half as high as the other. The Governor is Sir Gerard Smith. The Cabinet was as follows at the beginning of 1897: Premier, Treasurer, and Colonial Secretary, Sir John Forrest; Attorney-General, Septimus Burt; Commissioner of Lands, A. R. Richardson; Commissioner for Railways and Director of Public Works, F. H. Piesse; Minister for Mines and Education, E. H. Wittenoom.

The revenue of Western Australia reached the

astonishing figure of £2,842,731 for 1897, which was £384,057 more than the receipts for 1896. The yield of gold for 1896 amounted to 281,265 ounces, valued at £1,008,845, an increase of 42,753 ounces, as compared with the previous year. The yield for 1897 was expected to exceed £2,000,000 in value. The auriferous land extends from Dundas in the south to Kimberley in the northeast, covering a tract of 1,000 miles, in which 17 productive gold fields have already been discovered. The early boom was succeeded by a depression, from which the colony is emerging, as is shown by the increase in the railroad revenue and in land settlements. The Government has built railroads far into the interior, and in various other ways aided the gold-mining industry, including the erection of smelting works at Fremantle. The duties on mining machinery have been abolished. Many of the mines are now equipped with an expensive plant. The difficulty arising from scarcity of water in the gold fields is now met in a great measure by condensing water. The colony has very liberal land laws, offering to every settler the fee of 160 acres without payment, and even lending money for the development of the land. European investors who have expended immense sums in the gold mines of Western Australia complain of the mining laws of the colony. Certain onerous conditions regulating the employment of labor have already been modified to meet their views. As a further concession, they desire a law enabling them to amalgamate claims in the same district, at any rate, when these claims adjoin each other, so that they may be deemed a single holding for the fulfillment of labor conditions; also that the conditions effecting the forfeiture of a lease should be changed so as to favor the holder and secure a permanent title to persons who have expended large sums of money on mines. The present conditions as to labor permit two men to hold a claim of 24 acres, or any other area, for the first twelve months, after which one man must be working on every 6 acres. Sir John Forrest, when in England, promised that the Government would endeavor to meet the views of investors as to security of title for property on which British capital had been expended, and on other points, but a request for the abolition of duties on articles of food he was unwilling to comply with, because the colony not only wants to obtain ample revenues but also to build up a farming community that will produce all the food required by the people living in Western Australia. The Government intends to give assistance and encouragement to the pastoral industry, and is prepared to introduce a new land bill for this purpose. The mines of Western Australia, since the collapse of the share market, are being worked in a legitimate and businesslike manner. Trained mining engineers have gone into the fields to succeed ignorant and venal charlatans. The genuine properties are being opened up and developed under the supervision of competent managers, and are being equipped with the latest mining appliances. The labor conditions are at present extremely onerous for both the prospector and the capitalist, requiring an expenditure of £30 or £40 per annum on every acre of mineral ground, including the rental of £1 per acre. Wages vary from £3 10s. to £4 a week. The result has been that since the demand for prospecting exhibits ceased hundreds of leases have been abandoned, and no attempts are made to bring to light the properties, perhaps as rich as any yet discovered, that now lie hidden in the sandy desert of scrub. Capitalists are deterred from making new investments in Western Australian mines by the danger that they incur of having their property jumped and forfeited after they have spent large sums of money in purchasing

claims and in development work and machinery, simply because, perhaps through an oversight, they have failed to employ the full complement of men on the basis that the law requires.

The result of the elections in Western Australia was the return of Sir John Forrest to a third lease of power, with a mandate to continue the work of development that he has conducted with success, since the grant of responsible government to the colony in 1890. Since then the population of the colony has grown from less than 50,000 to 140,000, and the revenue, then under £500,000, has increased over fivefold. During the year ending March 31, 1897, no fewer than 35,000 persons went as emigrants into Western Australia. Trade has increased in the same proportion as the revenue, and the gold output in a larger ratio, the total yield since the first discovery in 1886 being £4,000,000. The railroads have been extended in six years from a total length of 400 miles to more than 1,400 miles, and telegraphs from 3,500 miles to 8,000 miles. The number of persons employed in the public services has fully doubled since 1894. The legislative machinery of the colony has itself been enlarged to meet the expanding needs of the population, the number of members in both houses having been increased, and an elective upper house substituted for a nominated Legislative Council. The franchise has also been remodeled and expanded to meet the wants of an inflowing adult population. Now the right to vote and to be elected as a member of Parliament is possessed by every man of full age who has lived twelve months in the colony and six months in his district. The property qualifications attaching to membership in the upper house have also been abolished, so that no colony in Australia has so extended a franchise save South Australia, where women are allowed to vote. The bold policy of public works that has distinguished the administration of Sir John Forrest has had the approval of the colonists. Just before the last general election he applied for authority to borrow to the extent of £6,000,000, and the proposal was passed without a division in both houses. During the last year he has been able to spend £1,000,000 out of the revenue upon public works, and he holds out the prospect of having for some time to come a sufficient surplus revenue to construct all necessary public buildings and local public works throughout the colony. He stated before the election that he has no further intention of increasing the loan liability of the colony, believing that the amount already authorized will suffice for several years, unless there is an unexpected influx of population. There was a board created for the protection of the aborigines under the act conferring responsible government. The Government of Western Australia proposed to transfer this duty to one of the departments, but objections were raised in England, where the system of indenturing natives was condemned as a species of slavery, and stories of inhuman treatment were circulated. The Colonial Office in London finally sanctioned the creation of a special Government department to look after the interests of the natives and to superintend the distribution of funds provided for their relief.

Tasmania.—The Parliament of Tasmania consists of an elective Legislative Council, for which the larger property holders and professional men vote, with 18 members elected for six years, and a Legislative Assembly of 37 members, voted for by all owners or occupiers of real property or possessors of an income of £60 and serving three years. The Governor is Viscount Gormanston, appointed in August, 1893. The Cabinet in the beginning of 1897 was composed of the following members: Premier, Sir E. N. C. Braddon; Chief Secretary,

W. Moore; Treasurer, Sir P. O. Fysh; Attorney-General, A. I. Clark; Minister of Lands and Works, A. T. Pillinger; minister without portfolio, Thomas Reibey.

In Tasmania the revenue returns were so favorable that the Government felt justified in making a reduction of income and other taxes. Attention has lately been directed with satisfactory results to mineral development in this colony. The Government has introduced a *crédit foncier* system.

New Zealand.—The legislative power is vested by the act of 1875 in a General Assembly, consisting of a Legislative Council of 44 members and a House of Representatives, whose number was reduced in 1887 to 74, including 4 Maoris. The Representatives are elected for three years, every adult man or woman having a vote who has resided a year in the colony and three months in the electoral district or possesses freehold property worth £25. Members of the Legislative Council who were appointed prior to Sept. 17, 1891, hold their seats for life; others are appointed for seven years. There were 302,997 registered white voters in 1893, of whom 193,536 were men and 109,461 women. In the Maori community 11,260 were registered. Of the whole population 45½ per cent. were qualified voters. The Governor at the beginning of 1897 was the Earl of Glasgow, appointed in June, 1892. He was succeeded by the Earl of Ranfurly. The ministry at the beginning of 1897 was composed as follows: Premier, Colonial Treasurer, Postmaster-General, and Electric Telegraph Commissioner, Commissioner of Trade and Customs, and Minister of Labor, R. J. Seddon; Acting Colonial Secretary and Commissioner of Stamp Duties, J. Carroll; Minister of Justice, Industries and Commerce, and Defense, T. Thompson; Ministers of Lands, Minister of Agriculture, and Commissioner of Forests, J. Mackenzie; Minister of Public Works and Minister of Marine, W. Hall-Jones; Minister of Railways and Mines, A. J. Cadman; Minister of Education and Immigration and Minister in Charge of Hospitals and Charitable Aid, W. C. Walker.

New Zealand continues to advance in wealth and prosperity. The revenue for 1897 was £78,000 more than in the preceding year. This colony has in the past few years enacted some of the most original and advanced laws in the world in regard to land, labor, and taxation, legislation that has been denounced as democratic and semisocialistic, but which has been, on the whole, successful in operation and met with the popular approval of the colony. By the new land laws hundreds of worthy industrious men have been made into honest, sturdy farmers for one who through inexperience or indolence has met with failure. Immense estates have been broken up, and every man in the colony has been afforded an opportunity of obtaining a piece of land on which to build himself a home. The labor legislation has been less entirely successful, and some of it is regarded by many of the well-to-do colonists as vexatious. Against their opinion may be placed the fact of increased prosperity in every branch of trade. Prices are good, the interest rate has fallen to 4 or 5 per cent., and the waste lands of the colony are being rapidly taken up. With the introduction of one man one vote and the extension of the franchise to women, the power of corporate wealth in New Zealand seems to have been irrevocably destroyed. The United States consul at Auckland, in reporting on these conditions, says that the more reasonable members of the labor associations are now disposed to let well alone for the present, and considers that the leveling process, which began about seven years ago, has reached a point where prudence, good taste, and a due regard for

the rights of others might fairly suggest a respite, and that, too, without loss of dignity or interest to any class. Compulsory labor arbitration, a principle that has been vigorously resisted in some countries, has worked satisfactorily in New Zealand during the short time that the arbitration law has been in operation. Under the act the colony is divided into districts, in each of which a board of conciliation, composed of an equal number of workmen and employers, can be constituted. Over this is a special central tribunal, which possesses appellate functions and whose decision is final. The central arbitration court is presided over by a judge of the Supreme Court of New Zealand, who is assisted by two assessors, one chosen by the employers, the other by the workmen. The trade unions have power to sue and are themselves liable to be sued, not only the union funds being attachable, but the individual members responsible to the extent of £10 each should the common fund fail to cover the liabilities. The penalty for evading the award of the tribunal is limited to £500. Since this act has been in operation no strike or lockout has occurred in New Zealand. A protest was raised in England against the shipping act of 1890, which compels all masters of vessels engaged in the coasting trade in New Zealand to pay the scale of wages fixed by arbitration boards. As these wages are twice as much as seamen ordinarily get, the act prevents British vessels from engaging in that trade unless the contract wages of the sailors are doubled while the vessels are thus employed. New mining laws have been enacted in this colony, and to these some persons have attributed the decrease in the yield during last year, notwithstanding the large amount of fresh capital employed. Mr. R. J. Seddon, the Premier, on the contrary, lays it to the delays caused by the initiation of a less primitive system of working the various properties. Time and labor that would otherwise have been spent on obtaining gold have been devoted to the erection of improved machinery and the driving of winzes and stopes. He claims that by the mining legislation of last year the New Zealand Government has acted in the interest of all concerned, as it has thereby defined the position of the various parties interested in mines instead of leaving it in doubt. The tenure given by the colony for mines on Crown lands is as good and permanent as though it were freehold, and in every case where a lease has expired the Government has been willing to grant a renewal. It offers special facilities for such renewals, subject to the conditions imposed being observed. The labor requirements, which some have complained of as being too severe, are only such as guarantee *bona fide* occupancy, and in fact the jumping of properties is unknown and impossible in New Zealand. Although £51,000,000 of gold has been dug in the colony from 1857 up to the present time, the deepest shafts have not been sunk more than 600 feet, and mining experts consider that only the surface has been scratched in the mining operations hitherto.

The Parliament which was opened on Sept. 23 passed laws promoting technical education, enacting a referendum, establishing Government fire insurance, providing old-age pensions for laborers, promoting the beet-sugar industry, and abolishing the tax on commercial travelers entering the colony.

Fiji.—The British flag was hoisted in the Fijian Islands at the invitation of the Queen and chiefs on Oct. 10, 1874. The Governor is assisted by an executive council, and laws are approved by an appointed legislative council, consisting of 6 official and 6 nonofficial members. In 12 of the 16 provinces a native chief, called the Roko Tui, governs the people, under the supervision of European of-

ficials, after their native laws and customs. European commissioners administer 3 Fijian provinces and Rotuma.

The population on Dec. 31, 1894, consisted of 2,666 Europeans, 1,167 half-castes, 9,180 East Indians, 2,232 Polynesians, 2,113 Rotumans, 103,750 Fijians, and 808 others; total, 121,867, divided into 67,132 males and 54,708 females. Of the Fijian natives 55,332 were males and 48,418 females. Among them 3,912 were born and 4,620 died in 1894.

The revenue from customs in 1894 was £37,677; from navigation dues, £4,754; from internal revenue and licenses, £4,754; from native taxes, £18,679; from court fees, etc., £7,058; from stamps, £1,808; total, £80,054. The expenditures were £36,889 for personal emoluments and £35,315 for other charges; total, £72,204.

There were 1,401 acres planted by European settlers to bananas in 1894, 18,603 acres planted to coconut palms, 19,282 acres under sugar cane, and small plantations of tea, sisal hemp, peanuts, yams, and tobacco. The export of sugar was 27,265 tons, valued at £496,245; of copra, 5,833 tons, value £57,261; of bananas and other green fruit, £49,115; of distilled spirits, 133,971 gallons, valued at £16,746.

Dependencies of the Australian colonies are the British half of New Guinea (see "Annual Cyclopaedia" for 1896) and the southern Solomon Islands. The northern part of this archipelago belongs to Germany. The southern islands, which have only recently been placed under British protection and are subject to the jurisdiction of the High Commissioner of the Western Pacific, lie between 7½ and 13° of south latitude and 150° and 163° of east longitude. The chief islands are Guadalcanar, San Christoval, Malaita, New Georgia, Gela, and Tulage. The number of foreign residents is about 50, mostly traders, scattered in twos and threes on the different islands and owning little trading schooners in which they collect produce and convey it to central stations, whence it is shipped to Sydney. There is a Government coaling station at Gavertu. The chief export is copra, which is smoke-dried, and hence less valuable than the sun-dried product of other South Sea islands. Next in importance are ivory nuts, growing in inexhaustible profusion on a species of sago palm and sent to Germany and Austria to be made into vegetable ivory buttons. Pearl shell, turtle shell, and *bêche de mer* are also exported. Tobacco is the chief article of barter. Pipes, matches, axes and other tools, cotton stuffs, and beads are also traded with the natives. Plantations of the coconut palm have been set out by some of the traders. The sago palm grows in vast numbers, and in New Georgia a kind of ebony is found.

AUSTRIA-HUNGARY, a dual monarchy in central Europe, composed, under the fundamental law of Dec. 21, 1867, of the Empire of Austria and the Kingdom of Hungary, two inseparable constitutional monarchies that are hereditary in the male line of the house of Hapsburg-Lorraine or, in the event of the extinction of the male line, in the female line. The legislative power for affairs common to both monarchies, viz., foreign relations, military and naval affairs, common finance, commercial and railroad affairs concerning both monarchies, the customs tariff, the coinage, and the administration of Bosnia and Herzegovina, is exercised by committees of the legislative bodies of the two halves of the empire, which meet alternately in Vienna and Buda-Pesth. These committees, called the Delegations, are composed of 20 of its members elected every year by the Austrian House of Lords and the same number from the Hungarian Table of Mag-

nates, and 40 from each of the lower houses, the Austrian House of Deputies and the Hungarian Table of Representatives. The two Delegations meet and vote separately, except when there is a disagreement, in which case the matter is decided by joint ballot. The common ministers are responsible to the Delegations and may be impeached for any dereliction of duty.

The Emperor of Austria and King of Hungary is Franz Josef I, born Aug. 18, 1840, who was proclaimed Emperor of Austria on Dec. 2, 1848, when his uncle Ferdinand I abdicated in consequence of a popular uprising. He was crowned King of Hungary on June 8, 1867, when the ancient privileges of that monarchy were restored. The heir presumptive is the Emperor's nephew, the Archduke Franz Ferdinand, son of the late Archduke Karl Ludwig and the Princess Annunciate, daughter of King Ferdinand II of Naples.

The ministers for the whole monarchy at the beginning of 1897 were: Ministers of Foreign Affairs and of the Imperial House, Count Agenor Maria Adam Goltchowski, born March 25, 1849; Minister of War, Gen. Edmund Edler von Kriehhammer; Minister of Finance, Benjamin de Kallay.

The Common Budget.—According to the *Ausgleich* or agreement in force in 1867 the expenses of the administration of common affairs, after deducting from the amount required the proceeds of the common customs and departmental receipts and 2 per cent. of the remainder, which is charged to Hungary, are borne by the two halves of the monarchy in the proportion of 70 per cent. for Austria and 30 per cent. for Hungary. The budget for 1897 was estimated at 160,584,751 florins, of which 2,618,871 florins are receipts of the Ministry of War, 122,412 florins those of other ministries, 50,573,136 florins the surplus from customs, 2,145,407 florins Hungary's 2 per cent., 73,578,452 florins Austria's quota, and 31,537,479 florins the quota of Hungary. The appropriations for the Ministry of Foreign Affairs are 4,019,500 florins for ordinary and 77,400 florins for extraordinary expenses; of the Ministry of War, 125,382,512 florins for ordinary and 14,797,187 florins for extraordinary expenses of the army, and 10,481,060 florins for ordinary and 3,600,200 florins for extraordinary expenses of the navy; of the Ministry of Finance, 2,693,500 florins; of the Board of Control, 133,392 florins.

The revenue collected in Bosnia and Herzegovina in 1896 was estimated at 14,413,590 florins, and the expenditure at 14,368,296 florins, exclusive of the extraordinary expenses of the army of occupation, estimated at 3,533,000 florins.

Public Debt.—The general debt, contracted before 1878, amounts to 2,766,183,000 florins. The interest and sinking fund in 1896 amounted to 127,377,468 florins, of which Austria paid 97,066,393 and Hungary 30,311,075 florins. There is a common floating debt, amounting at the end of 1896 to 192,896,145 florins. Austria's special debt was 1,435,338,000 florins in 1895, costing 70,696,391 florins a year. The special debt of Hungary has grown from 1,763,484,000 florins in 1890 to 2,144,786,000 florins in 1895.

Area and Population.—The area of Austria-Hungary is 249,942 square miles. The population at the census of Dec. 31, 1890, was 41,231,342. Austria, with an area of 115,903 square miles, had a population of 23,895,413, composed of 11,689,129 males and 12,206,284 females. The number of marriages in 1894 was 194,233; of births, 928,739; of deaths, 682,803; excess of births, 245,936. The population of Vienna, the capital, in 1890 was 1,364,548; of Prague, 184,106; of Trieste, 158,344. There were 19,146 elementary schools in 1894, with 68,038 teachers and 3,312,530 pupils, out of a total

population of school age of 3,807,376. These schools are supported by the communes. The subjects of instruction are religion, reading, writing, language, arithmetic and elementary geometry, geography, history, some branches of natural history and physics, drawing, singing, gymnastics, and for girls domestic economy. The age of compulsory attendance is from six to fourteen. There are 81 training colleges for teachers.

The area of Hungary is 125,039 square miles. Its population in 1890 was 17,463,473, comprising 8,667,971 males and 8,795,502 females. The number of marriages in 1894 was 166,033; of births, 761,607; of deaths, 563,558; excess of births, 198,049. Budapest, the capital, had on Dec. 31, 1890, a population of 506,384. In Hungary education is compulsory between the ages of six and twelve. There were 16,536 primary schools in 1895, with 28,731 teachers and 2,540,183 pupils out of a total of 3,221,513 of school age. For teachers there are 70 normal schools.

The number of emigrants from Austria-Hungary in 1894 was 25,566, against 65,544 in 1893, 74,947 in 1892, and 78,524 in 1891. The destination of 22,965 in 1894 was North America. In 1895 the number of Austrians emigrating was 18,256, and of Hungarians 15,206; in 1896 there were 34,196 Austrian and 30,898 Hungarian emigrants.

The Army.—The military system established by the Austrian and Hungarian laws of 1889 divides the military forces into the army and its Ersatz troops, or reserve, common to the whole monarchy, and the Landwehr, with its Ersatz reserve, a national institution in each half of the empire. Men who do not belong to either the army or the Landwehr and those who have served their time in the Landwehr are enrolled in the Landsturm for ten years. The period of service in the active army is three years, beginning at the age of twenty-one; then seven years in the reserve. Those not called into active service spend the whole ten years in the Ersatz reserve. Men transferred from the army serve two years with the Landwehr; others twelve years. There are 15 army corps, usually consisting of 2 divisions of 2 brigades of infantry, 1 brigade of cavalry, and 1 brigade of artillery. The annual contingent of recruits for the regular army is 103,100 men, 60,389 being furnished by Austria and 42,711 by Hungary. The annual contingent for the Austrian Landwehr is 10,500, and for the Hungarian Honved 12,500. The peace strength of the Austro-Hungarian army in 1896 was 25,176 officers and 334,717 men; total, 359,893, with 47,149 horses. There were 3,738 staff officers, with 3,843 men, 79 officers, and 2,854 men in the sanitary corps, 1,536 officers and 7,680 men in the military schools and other establishments, 10,047 infantry officers and 177,712 infantry men, 1,874 officers and 45,506 men in the cavalry, 1,636 officers and 28,152 men in the field artillery, 412 officers and 7,760 men in the fortress artillery, 575 officers and 9,918 men in the pioneers, railroad, and telegraph corps, etc., and 393 officers and 1,899 men in the artillery train of the regular army. The Austrian Landwehr consisted of 2,168 officers and 20,657 men in the infantry and 196 officers and 1,899 men in the cavalry; the Hungarian Honved of 2,132 infantry officers and 21,232 men, and 390 officers and 4,251 men in the cavalry. The war strength of the army is stated to be 45,238 officers and 1,826,940 men, with 281,886 horses, not counting the Landsturm, estimated at more than 4,000,000 men. There are 1,048 field guns in peace and 1,864 on the war footing.

The Navy.—The Austro-Hungarian navy is small, but is kept up to the modern requirements for the defense of the ports and commerce of the empire. There are 8 battle ships, 8 port-defense

vessels, including 4 monitors for the Danube, 5 new cruisers, 23 third-class cruisers, and 25 first-class, 5 second-class, and 26 third-class torpedo boats. The "Monarch," "Wien," and "Budapest," sister ships launched in 1895 and 1896, have a displacement of 5,350 tons, 10 1/2 inches of side armor, engines of 8,500 horse power, giving a speed of 17 knots and an armament consisting of 4 9 1/4-inch guns and 6 5 1/2-inch and 14 47-millimetre quick-firing guns, besides machine guns and 4 torpedo ejectors. The rain cruiser "Marie Theresia," launched in 1893, has a displacement of 5,250 tons and engines of 9,800 horse power, making 19 knots, and carries 2 9 1/4-inch, 6 6-inch, and 11 quick-firing guns and 4 torpedo ejectors. The "Kaiser Franz Josef" and "Kaiserin Elizabeth," of 4,000 tons, are similarly constructed. A new armored cruiser now building, of 6,100 tons, with a belt of 10 1/2-inch armor, is designed to carry 2 9 1/4-inch guns, 8 5 1/2-inch quick fliers, 18 smaller ones, 4 torpedo tubes, and to run 20 knots an hour with 12,000 horse power. The personnel of the navy consists of 628 officers, 446 petty officers and mechanics, 7,500 sailors, and 4,500 marines. The marines are raised by conscription like the army, and when the term of four years is past they are transferred to the reserve for five years, and then form part for three years longer of the Seewehr, created in 1888, which corresponds to the Landwehr.

Commerce and Production.—Austria is a country of diversified industry, though agriculture employs about half the working population. Hungary is mainly an agricultural country. The wheat crop of Hungary in 1894 was 53,085,000 hectolitres, while that of Austria was 16,982,000 hectolitres. Hungary produced 28,382,000 hectolitres of maize, and both countries grew large crops of oats, rye, and barley. The sugar beet is extensively grown in Austria, the crop amounting to 67,285,000 hectolitres, and potatoes cover as large an area as wheat. The exports of horses, of which there were 1,548,197 in Austria and 1,997,355 in Hungary at the last census, and of cattle and sheep, are much greater than the imports. There are 9,775,722 hectares of forest in Austria, over two thirds of it covered with pines, and in Hungary 9,074,000 hectares, of which 2,440,167 hectares are oak, 4,752,978 hectares beech, and 1,880,975 hectares beech forest. The exports of timber and forest produce from Hungary amount to 24,000,000 florins a year. The coal mined in Austria in 1895 was worth 60,000,000 florins; the Hungarian output was worth 23,700,000 florins. The iron produced in Hungary was 27,771,000 florins in value; the Austrian output, 12,490,000 florins. The total value of the merchandise imports of Austria-Hungary in 1895 was 722,500,000 florins, and of the exports 741,800,000 florins. The chief imports were: Cotton, 51,687,000 florins; wool, 39,232,000 florins; coffee, 37,631,000 florins; coal, 33,501,000 florins; woolen yarn, 24,978,000 florins; machinery and carriages, 24,179,000 florins; leaf tobacco, 21,257,000 florins; silk, 20,295,000 florins; grain, 18,900,000 florins; hides and skins, 17,991,000 florins; instruments and clocks, 17,422,000 florins; leather, 16,700,000 florins; books and maps, 15,691,000 florins; silk goods, 14,409,000 florins; live animals, 14,018,000 florins; cotton yarn, 13,939,000 florins; manufactured tobacco, 4,221,000 florins. The principal exports were: Sugar, 63,003,000 florins; sawed timber, 39,500,000 florins; cattle, 39,396,000 florins; eggs, 39,357,000 florins; coal, 30,427,000 florins; grain, 28,722,000 florins; hardware and clocks, 26,106,000 florins; glassware, 23,048,000 florins; horses and mules, 22,756,000 florins; gloves, 21,457,000 florins; wood and bone goods, 18,824,000 florins; hides and skins, 18,409,000 florins; woolen goods, 17,837,000 florins; bev-

erages, 13,464,000 florins; leather goods, 13,278,000 florins; iron goods, 12,423,000 florins; paper and paper goods, 11,848,000 florins; wool, 10,409,000 florins.

The imports into Hungary in 1895 were valued at 543,977,000 florins, the chief articles being cotton goods for 58,649,000 florins, woollens for 45,738,000 florins, clothing for 18,960,000 florins, silk goods for 17,719,000 florins, sugar for 10,104,000 florins, wine in casks for 9,960,000 florins, and cotton yarn for 9,004,000 florins. The total value of all Hungarian exports was 504,812,000 florins, of which 86,417,000 florins represent cattle, pigs, and horses; 71,671,000 wheat, corn, and barley; 69,618,000 flour; 19,287,000 wine in casks; 11,489,000 cask staves; 8,822,000 wool; and 8,739,000 eggs. Of the imports into Hungary 81 2/3 per cent. came from Austria, and of the Hungarian exports 77 2/3 per cent. went to Austria.

The value of gold and silver coin and bullion imported into Austria-Hungary during 1894 was 37,639,940 florins, and in 1895 it was 54,146,791 florins; the exports in 1894 were 27,361,456 florins, and in 1895 they were 24,257,737 florins in value.

The trade of Austria-Hungary was divided among foreign countries in 1895 as follows, values being given in Austrian florins:

COUNTRIES.	Imports.	Exports.
Germany.....	256,592,000	393,342,000
Great Britain.....	75,285,000	61,740,000
Italy.....	47,519,000	62,864,000
Russia.....	46,867,000	25,806,000
France.....	25,861,000	30,417,000
Switzerland.....	21,372,000	34,656,000
United States.....	37,660,000	16,839,000
British India.....	40,110,000	6,571,000
Roumania.....	13,888,000	24,914,000
Brazil.....	34,292,000	2,192,000
Turkey.....	15,506,000	19,587,000
Servia.....	17,292,000	9,248,000
Belgium.....	13,297,000	7,451,000
Netherlands.....	11,291,000	8,352,000
Egypt.....	7,057,000	8,345,000
Greece.....	10,345,000	3,877,000

Navigation.—The number of vessels entered at the ports of Austria increased from 66,271, of 8,773,713 tons, in 1890, to 87,503, of 9,494,229 tons, in 1895; the number cleared increased from 66,257, of 8,759,632 tons, to 87,421, of 9,472,485 tons. Austrian vessels formed 85 per cent. of the total number and 89 per cent. of the tonnage. At the port of Trieste 8,085 vessels in the foreign trade were entered, aggregating 1,760,655 tons, and 8,103, of 1,759,875 tons, were cleared in 1895; at the port of Fiume 7,023, of 1,063,970 tons, were entered and 7,006, of 1,060,538 tons, cleared.

The number of vessels owned in Austria and Hungary on Jan. 1, 1896, was 11,912, of 264,193 tons, employing 33,023 men in their crews. Of the total number, 244, of 202,352 tons, were seagoing merchant ships; 1,746, of 38,849 tons, coasting vessels; and 9,922, of 22,992 tons, vessels engaged in the fisheries.

Communications.—The railroads owned by the state had a total length of 4,950 miles in Austria in 1895, besides which the state operated 589 miles belonging to companies, while the railroad companies had 4,561 miles. In Hungary the Government owned 6,725 and companies 1,462 miles. The Austrian roads carried 102,838,000 passengers in 1894, and 92,865,000 tons of freight. The receipts were 243,208,000 florins, and the working expenses 136,227,000 florins. On the Hungarian lines in 1893 the number of passengers carried was 95,582,000, and the freight traffic was 124,460,000 tons. The receipts were 102,591,000 florins, and expenses 53,702,000 florins.

The Austrian postal traffic in 1895 was 689,306,

140 letters and postal cards, 99,071,300 samples and printed packets, and 82,309,600 newspapers; receipts, 45,184,751 florins; expenses, 42,158,412 florins. The Hungarian post office in 1895 forwarded 152,880,000 letters and postal cards, not including telegrams and franked letters, 31,284,000 book-packets, samples, etc., and 89,081,000 newspapers; receipts, 16,771,000 florins; expenses, 12,153,000 florins.

The telegraphs of Austria had a total length of 29,750 miles in 1895, with 86,328 miles of wire. The number of dispatches sent during 1895 was 13,234,625. In Hungary there were 12,473 miles of telegraph lines, with 35,320 miles of wire. The number of dispatches in 1894 was 9,969,844. In Bosnia and Herzegovina the telegraphs had 1,784 miles of line and 4,262 miles of wire in 1893, and the number of messages that were sent in that year was 531,269.

Bosnia and Herzegovina.—The Turkish provinces of Bosnia and Herzegovina, in accordance with a provision of the Berlin Treaty, have been administered by the Austro-Hungarian Government since 1878. The Bosnian Bureau is subject to the authority of the Imperial Minister of Finance. The provincial government in Sarajevo, divided into the departments of finance, internal affairs, and justice, is assisted by an advisory body consisting of the dignitaries of the Greek Church and 12 representatives of the people. Bosnia and Herzegovina have an area of 23,262 square miles. The sanjak of Novi Bazar is occupied by Austro-Hungarian troops, but is administered by Turkish officials. The population of the occupied provinces in 1895 was 1,568,092, comprising 828,590 males and 739,502 females. There were 673,246 Greek Orthodox, 334,142 Roman Catholics, 3,596 Evangelical, and 251 other Christian inhabitants, 548,632 Mohammedans, 8,213 Jews, and 12 of other religions. Except the Albanians of the southern part and scattered gypsies the people are of the Servian race. Tobacco is the most valuable product. Wheat, corn, and other grains, potatoes, flax, and hemp are cultivated. Dried prunes are exported largely. Cattle breeding is an important industry. There were 233,322 horses, 1,416,394 cattle, 1,447,049 goats, 3,230,720 sheep, and 662,242 hogs in 1895. Nearly half the country is covered with forest. Iron, copper, manganese, antimony, chromium, quicksilver, lead, and zinc are mined. Compulsory military service has been introduced, and 5,185 men were enrolled in the local forces in 1895. The Austrian army of occupation numbers 22,904 men.

Renewal of the Austro-Hungarian Compromise.—The negotiations for the renewal of the Austro-Hungarian *Ausgleich*, the settlement of the amount to be contributed by each half of the monarchy to the common expenses, were not concluded by the Austrian and Hungarian deputations, which separated with mutual expressions of regret that they had failed to come to an agreement. Hence, in virtue of the constitutional law, the question was referred to the two governments, which submitted their decision to the parliaments in Vienna and Buda-Pesth. Count Balen and Baron Banffy decided to continue the expiring treaty for one year more pending further negotiations. Under the present arrangement Austria pays 68.6 per cent, and Hungary 31.4 per cent. In view of the great economic development of Hungary it was urged by the Austrian deputation that the Hungarian quota ought to be raised to 43.16 per cent, and that of Austria reduced to 56.84 per cent. Hungary, which in the last decade has enjoyed a comparatively greater degree of growth and prosperity than Austria, though still possessing far less wealth and industrial development, was willing to bear a heavier

part of the imperial expenses than heretofore, but the Hungarian representatives objected strenuously to the principle put forth by their Austrian colleagues that the number of the population in the two halves of the dual monarchy should henceforth furnish the basis of calculation. They urged on the part of Hungary that the quota should be based on the revenue derived from taxation in each half of the monarchy, since the great majority of the population of Hungary is agricultural and comparatively poor. The deputation of the Austrian Reichsrath in May reduced the contribution demanded from Hungary to 36.4 per cent, but the Hungarian deputation would not agree to a higher quota than 33.2 per cent. The negotiations were broken off, and the Hungarian Government would not renew them, being unwilling to commit itself to any precise figures in the absence of an assurance that the Austrian Government could secure the sanction of the Reichsrath for any definitive agreement. The Austrian agricultural interests wanted protection against Hungarian flour, while the growing industrial interests of Hungary would willingly see the customs union lapse in order to establish protective duties against Austrian manufactures. Hence there were strong influences at work in both halves of the monarchy tending to retard a settlement. Negotiations were begun in September for the provisional extension of the existing *Ausgleich*. The two premiers agreed to an extension for twelve months, and bills to authorize this arrangement were introduced in both parliaments. The temporary extension includes the customs and commercial treaty and the understanding between the two governments and the Austro-Hungarian Bank.

International Politics.—The visit of Count Goluchowski, Austro-Hungarian Minister of Foreign Affairs, in Berlin in January, 1897, showed with sufficient clearness that the *rapprochement* between Austria and Russia created no coldness between Austria and Germany and did not affect their defensive alliance. In the Grecian question Austria, which was the first to suggest coercive measures, acted throughout in evident harmony with Germany, and both in a spirit of compliance toward or agreement with Russia that contrasted with the wavering attitude of Russia's ally, the French Republic. The German Kaiser, instead of meeting the Emperor Franz Josef at a frontier watering place, this year visited Vienna, where he was received with royal honors on April 21. The Austrian Emperor visited the Czar at St. Petersburg, and there an understanding is supposed to have been reached regarding matters that might lead eventually to a rupture between Austria-Hungary and Russia, and causes of difference or suspicion to have been, for a time at least, smoothed away.

The Reichsrath in 1896 sanctioned a so-called investment loan, free of taxes and bearing 3½ per cent. interest, to raise 53,500,000 florins for the payment of debts incurred by the various ministries, to cover the costs incurred in the transfer to the state of the telephone system, to increase the rolling stock of the state railroads, and to set aside a sum for new investments. In February the Government issued 58,000,000 florins, representing the amount of the new loan, which was taken at the net price of 92 per cent. by a syndicate composed of the firm of Rothschild, two Vienna banks, and the Post Office Savings Bank, with the understanding that all profits accruing to the syndicate from subscriptions over and above the price of 93½ per cent. shall be shared equally with the Government. This is the first state issue in Austria that bears so low a rate as 3½ per cent. interest, the previous average annual rate being 4 per cent.

Austria.—The Austrian Reichsrath is composed of the Herrenhaus, or House of Lords, in which 21 princes of the imperial family, 67 territorial nobles, 2 cardinals, 8 archbishops, 7 bishops, and 120 life members have seats, and the House of Deputies, of 353 members elected for six years, partly by the direct votes of citizens twenty-four years of age who possess a small property of other qualification. The electors are divided into four classes: Landed proprietors paying from 50 to 250 florins in direct taxes, according to the province in which their estates are situated, who elect 85 Deputies; chambers of trade and commerce, represented by 21 Deputies; the towns, where every citizen who pays direct taxes of 5 florins or over or who possesses certain personal qualifications, has a direct vote, electing 118 Deputies; and rural communes, where a similarly qualified class of voters choose 1 elector for every 500 inhabitants, and these electors meet and vote for the 129 rural Deputies.

Bohemia is represented in the Reichsrath by 92 Deputies, Galicia by 63, Lower Austria by 37, Moravia by 36, Styria by 23, Tyrol by 18, Upper Austria by 17, the coast land by 12, Carniola by 10, Silesia by 10, Carinthia by 9, Bukowina by 9, Dalmatia by 9, Salzburg by 5, and Vorarlberg by 3. Each province has its own Landtag, or diet, and possesses a large degree of autonomy. The Landtage are single chambers, elected similarly to the Reichsrath, for six years, containing in Lower Austria 72 members, in Upper Austria 50, in Salzburg 26, in Styria 63, Carinthia 37, Carniola 37, Görz and Gradiska 22, Istria 33, Tyrol 68, Vorarlberg 21, Bohemia 242, Moravia 100, Silesia 31, Galicia 151, Bukowina 31, and Dalmatia 43.

The Austrian Cabinet, constituted on Sept. 29, 1895, consisted in the beginning of 1897 of the following members: President of the Council and Minister of the Interior, Count Casimir Badeni; Minister of Education and Ecclesiastical Affairs, Baron D. Gautsch von Frankenthurn; Minister of Finance, Ritter von Bilinski; Minister of Agriculture, Count T. Ledebur Wicheln; Minister of Commerce and National Economy, Baron Hugo Glanz von Eieha; Minister of National Defense, Field-Marshal Count Zeno von Welsersheimb; Minister of Justice, Count Johann Gleispach; Minister for Railroads, E. von Guttenberg.

Finances.—The budget estimate of revenue for 1897 was 692,703,959 florins, of which 681,083,783 florins were ordinary, and 11,620,176 florins extraordinary receipts. The following are the sources of revenue: Reichsrath and Council of Ministers, 813,485 florins; Ministry of the Interior, 1,175,373 florins of ordinary, and 52,370 florins of extraordinary receipts; Ministry of Defense, 394,126 florins; Ministry of Worship and Education, 6,594,274 florins of ordinary, and 133,700 florins of extraordinary receipts; Ministry of Finance, 494,303,807 florins of ordinary, and 1,260,629 florins of extraordinary receipts; Ministry of Commerce, 50,170,870 florins of ordinary, and 47,120 florins of extraordinary receipts; Ministry of Railroads, 108,959,780 florins of ordinary, and 9,129,300 florins of extraordinary receipts; Ministry of Agriculture, 13,869,782 florins of ordinary, and 2,948 florins of extraordinary receipts; Ministry of Justice, 1,039,479 florins of ordinary, and 8,800 florins of extraordinary receipts; pensions, subventions, etc., 1,320,123 florins of ordinary, and 255,300 florins of extraordinary receipts; state debt, 2,431,834 florins of ordinary, and 580,000 florins of extraordinary receipts; various sources, 10,850 florins of ordinary, and 150,000 florins of extraordinary receipts.

The total expenditure for 1897 was estimated at 692,161,183 florins, of which 655,775,446 florins are for ordinary, and 36,385,737 florins for extraordi-

nary purposes. The ordinary expenditures are 4,650,000 florins for the imperial household, 79,500 florins for the Imperial Cabinet Chancery, 2,472,206 florins for the Reichsrath and Council of Ministers, 22,725 florins for the Supreme Court, 116,736,482 florins for the Austrian contribution to the common expenditure, 20,620,567 florins for the Ministry of the Interior, 22,677,650 florins for the Ministry of Defense, 26,026,219 florins for the Ministry of Worship and Education, 96,256,303 florins for the Ministry of Finance, 45,040,404 florins for the Ministry of Commerce, 85,344,500 florins for the Ministry of Railroads, 15,846,411 florins for the Ministry of Agriculture, 22,859,800 florins for the Ministry of Justice, 175,200 florins for the Board of Control, 28,125,030 florins for pensions, subventions, etc., 168,137,859 florins for the public debt, and 637,990 florins for management of the debt. The extraordinary expenditures are 185,685 florins for the Reichsrath and Council of Ministers, 2,366,198 florins for common extraordinary expenditure, 3,789,284 florins for the Ministry of the Interior, 416,520 florins for the Ministry of Defense, 1,647,362 florins for the Ministry of Worship and Education, 7,131,374 florins for the Ministry of Finance, 2,182,800 florins for the Ministry of Commerce, 12,700,230 florins for the Ministry of Railroads, 1,875,500 florins for the Ministry of Agriculture, 2,127,008 florins for the Ministry of Justice, 1,504,500 florins for pensions and subventions, and 28,500 for debt.

Agrarian Agitation.—The most remarkable social manifestation of the year was a movement akin to social democracy among the peasantry in certain parts of the country, particularly in Galicia. The leader of the movement among the Polish peasants was Father Stojalowski, an eloquent priest, whose views partake of the social philosophy of Karl Marx, and whose sermons are a singular mixture of the style of the Hebrew prophets with modern socialistic phraseology. While a parish priest he began to inveigh against the tyranny of landlords and the injustice of Government officials, and for this he was repeatedly the object of disciplinary punishment on the part of the bishop of his diocese. Hence he resigned his living and joined the archdiocese of Antivari, in Albania, thereby placing himself outside the jurisdiction of the Galician episcopacy, though he remained in Galicia as a priest without a charge. He preached, whenever he could get an opportunity, against the iniquity of great people, existing at the same time two magazines, in which he advocated his principles. The Austrian Government prosecuted him on various minor charges, such as his having read mass in a public house and his having refused to comply with an order for the dissolution of a political meeting. The Pope ordered him to go to his own diocese of Antivari, and when he refused to do this he was excommunicated. He protested against his excommunication, declaring that it was contrary to the canons, and was therefore null and void, and that the bishops had perverted the intentions of the Pope. His excommunication did him least harm in the very part of the country that is considered the main stronghold of the Catholic religion. His followers declared that the Galician authorities wished to get rid of him in view of the coming elections. He continued his campaign, and continued also to say mass, thus infringing the Austrian law. His utterances had a Russophile tinge, and contained also an admixture of anti-Semitic sentiment, but their burden was the vindication of justice for the peasantry, which had been robbed by the nobility and was denied its rights by the civil authorities. After he was repeatedly prosecuted and imprisoned for offenses against the press laws, Father Stojalowski fled to Hungary, where he

was arrested and kept in custody some weeks at the instance of the Austrian Government. The Hungarian authorities finally refused the application for his extradition, and on Jan. 11, 1897, set him at liberty. The Galician agrarian movement, to which Father Stojalowski gave fresh impulse and development, is one of long standing, dating from the annexation of western Galicia to Austria and the abolition of serfdom by the Emperor Josef II. Up to that time there existed in Galicia the old Slavonic institution of the *mir*, the village commune. When this system came to an end it was succeeded by that of private property, in the apportionment of which the peasants deemed that they were deprived of their own, although portions of the forests and pasture lands remained in the possession of the communes. For many years this grievance was a sore point with the Galician peasantry. Polish novelists have made the hatred of the peasants toward the landlords who have deprived them of their forests the motives of their romances, and popular songs have contributed to perpetuate the feud. There is a prevailing notion in the rural districts that the Emperor wants his beloved peasants to get their forests back again. During the revolutionary movement among the Polish nobility and students in 1848 the Austrian Government armed the peasantry for the preservation of public order, but with disastrous results, for nobles and their families were massacred by hundreds, their houses were burned and pillaged, and a reign of terror hung over the country until Gen. Benedek came with imperial troops and put down the peasants by military force. The agricultural distress and the spread of socialistic teachings have revived the old grievance; but, whereas the principal seat of the peasant movement at that time was in eastern Galicia, where most of the noblemen are Poles and Roman Catholics, while the peasants are Ruthenians of Greek Catholic or Greek Orthodox faith, the present agitation has its headquarters in the western part of the province, where both landlords and peasants are Poles and Roman Catholics. The approach of the electoral campaign of 1897 witnessed an increase in the agitation among the peasants. In one instance a meeting summoned by members of the clergy to express confidence in the Polish representatives in the Reichsrath voted down a resolution to that effect by a large majority. In their electoral manifestoes the followers of Father Stojalowski appealed to their brother peasants (upon whom had been shifted the heaviest burden of the taxes, whose debts were driving them from their native soil into the wide world, and whose rights were betrayed in Vienna to the landlords) to drive out the recreant representatives and send faithful men to the Reichsrath who would have the law altered so as to restore and defend their rights. Prince Sanguszko, the Statthalter of Galicia, at the opening of the provincial Diet condemned without reserve all who took part in the movement among the peasantry and working classes. This gave occasion to interpellations in the Reichsrath, where Polish members inquired whether the Government intended interference in the electoral campaign, and reflections were suggested regarding the means by which is secured the election of a compact group of Poles, three quarters of whom represent exclusively the interests of the nobility and the clergy.

The Ruthenian nationality entered the field of racial politics in 1897, and put forth a programme that is partly national, demanding the division of Galicia into two administrative districts—one Ruthenian and the other Polish and partly agrarian, appealing to the Polish as well as to the Ruthenian peasantry, the main demand proposing the sale of

the great estates and their division into small peasant holdings. The Ruthenians, though outnumbering the Poles, under the new election law elected for the first time separate national representatives in the Diet and in the Reichsrath.

General Election.—The admission of the new category of electors, which practically established universal suffrage, was attended with new developments in political parties. The rivalry between the Anti-Semites and the Social Democrats, both bidding for the votes of the newly enfranchised class, became more acute. The old German Liberal party, that once directed the fortunes of the empire, was practically submerged by the new parties, and even the remnant joined the general hue and cry against the development of capitalism, which this party had done most to foster. A new German National party, composed largely of the less instructed German population enfranchised by the new electoral law, expressed the racial jealousy roused in antagonism to the triumph of Czech nationalism. This intense German revival reacted in turn on the Czechs and the Poles, and established a closer bond between these nationalities which have had more grounds of antagonism than of political fusion so long as the Czechs coquetted with Pan Slavism, and appealed to the protection of the Russians to save their nationality and language from extinction. Having found powerful allies within the empire, the Czechs dropped their Pan Slavism as if it were a mask, and in effusive gatherings with the Poles echoed the hereditary antipathy of the latter against Russia.

The Social Democrats of Vienna arraigned severely the Anti-Semitic majority in the municipal council, reproaching it with working in a direction directly opposed to the interests of the people by withdrawing subventions from the public library and societies for the winter refuges for the poor and attaching such conditions to the subvention to the volunteer ambulance society, which included some Jews in its membership, that the society properly refused it, and, on the other hand, by granting a large subvention to a suburban church building association, thus betraying its Ultra-Clerical tendencies and its subservience to the Clericals, who had contributed large funds for the Anti-Semite electoral campaign. Dr. Adler, the Social Democratic leader, accused the vice-burgomaster of desiring to expend 30,000,000 florins on the city gas-works for political purposes, and said that the Christian Socialistic municipal council had shown itself an enemy to the working classes sooner than was expected. The Anti-Semitic and Christian Socialist leaders in advising their followers to purchase nothing from the Jews, in whose hands most of the trade and capital were concentrated, did not aid the prosperity of the capital, which lagged in a depressing way, while the general feeling was that the administration was generally unsatisfactory, and disgust was expressed at the violent altercations in this municipal council and its partisan decisions and oppression of the minority. The Government made some attempt to hold in check the Christian-Socialist and Anti-Semitic elements, yet, with no effective support from the Liberal party, which had almost ceased to exist as such and was undergoing a fundamental transformation, it had nothing to fall back upon but a disorganized and disunited minority in any attempt to curb the imposing Clerical majority that stimulated and protected popular passions and social jealousies that formed no part of its own party tenets. The Social Democracy of Austria regarded the troublesome and confused political situation as rapidly leading to their advent to power. Their numbers tended constantly to increase, and the exemplary discipline of the party was well maintained. They half expected to win the elections for the

Reichsrath in the capital, and afterward attributed their defeat to the fact that their rivals, the Anti-Semites, controlled the administration and the electoral machinery. They counted surely on sending 20 representatives to the Chambers from the capital and other manufacturing centers, and in this they were not disappointed. Long before the elections the Government made a concession to the industrial classes in the matter of prison labor by increasing the tariff paid by contractors who farmed the work of convicts in order to lessen the competition that industry and trade suffered from prison-made goods.

The electoral campaign was the most exciting and keenly contested that Austria has ever known. The new German popular party carried on a spirited canvass in Austria proper, Bohemia, Styria, and Silesia against the Clerical and Anti-Semitic alliance. They hoped to gain about 30 seats. Their programme, which looked to the formation of a great German party on the single basis of nationality, proposed a union of the middle classes with a view of working out social reforms gradually, free from socialistic theories, but still opposed to the growing preponderance of capitalism. The manifesto of the Austrian episcopate, signed by 5 cardinals, 4 archbishops, and 26 bishops, advised the electors to vote for men who pledge themselves to defend the principles and interests of the Church, notably that of religious education, against the attacks of the anti-religious. The Social Democratic party issued a manifesto reminding the Social Democrats of Austria that, in virtue of the new electoral law, they were for the first time entitled to vote, and urging them to vote in such manner that the laboring classes should be represented and the Social Democracy be heard from the only tribune in Austria that is free from police supervision, so that the whole truth may be told without reticence, and the sufferings and requirements of the laboring section of the population be made known in the place where hitherto laws opposed to the working classes have been created. The impending struggle was foretold to be a hard one, for the Government would be hostile to the Social Democracy, which would have to fight, moreover, the elements of reaction under various names and guises, all in league against the Social Democracy, and wearing each its mask of friendship for the people, behind which it was nevertheless easy to detect the trinity of the landholding nobility, the capitalists, and the priesthood. The Socialists carried on an active campaign in Vienna and in all the mining and manufacturing centers with fair success, especially in some of the workingmen's districts in the north, and in Bohemia. In that province there was intense excitement, and such antagonism between the Germans and the Young Czechs as to lead to rioting. The mixed nationalities were everywhere in a ferment, and presented a more complex problem than in any previous election. Dr. Lueger's Anti-Semites in Vienna showed no signs of declining strength or lack of enthusiasm. The Anti-Semites and Social Democrats, in competing for the new category of Deputies, 73 in number, to be elected for the first time by universal suffrage, were nightly involved in election fights in Vienna and other populous centers, and the police only intervened when bloodshed occurred. Father Stojalowski, from his headquarters at Czaczka, near the frontier of Galicia, organized the revolt of the Polish peasant voters which menaced the control over their votes and representation that the Galician aristocracy and clergy have been accustomed to exercise. Under the leadership of Dr. Rieger, the Old Czechs effected a coalition in many districts with the Young Czechs in the electoral contest against Germans, Social Democrats, and Anti-Sem-

ites. In some districts, however, Young Czechs opposed their candidates to those of the Old Czechs. The most obvious feature in the campaign was the manifest strength of the Clerical and Anti-Semitic coalition. Count Badeni, the Austrian Premier, threw the weight of his influence in favor of the groups characterized by the Liberals as reactionary, with the object of building up a new Government party that should embrace all sections of Conservatism and Catholicism. The aristocratic Hohenzwart Club, the feudal party of Bohemia, and the Clericals in Tyrol and Salzburg, Upper Austria, and Styria rallied to the summons to form a Center party in the new Reichsrath that should be the nucleus of a strong Government majority.

The elections for the lower house of the Reichsrath began on March 9. The Christian Socialists prevailed in the capital over the Social Democrats, polling, in fusion with the Anti-Semites, 117,000 votes to 88,000 cast by the Social Democracy aided by many Liberals and even some Moderate Conservatives. The Christian Socialists for their part have been assisted by the influence of the Vatican and the patronage of the papal nuncio, and count as allies the lower clergy, who are generally discontented with their own lot, and thus received a great number of Ultramontane votes, while the episcopacy and higher clergy, mistrustful of the interference of the Vatican and apprehensive of assaults on their own privileges and authority, gave a dubious and half-hearted support. Of the German Liberals who sat in the last Reichsrath one third were displaced, mainly by German Nationalists. The party, which had 114 representatives in the former parliaments, disappeared as a separate group, becoming merged in the Progressists, while the National Germans increased from 19 to 43. The new Unterhaus was composed of 77 Progressive Germans, 43 German Nationalists, 28 Christian Socialists, 63 Clericals, 20 Social Democrats, 62 Young Czechs, 21 Feudal Czechs, 59 Conservative Poles, 15 Italian Liberals, and 50 representatives of other parties. The Poles no longer returned a solid deputation controlled by the Clericals, but sent some Agrarian Socialists and Ruthenians, and even a Social Democrat from Cracow. In the urban *cucias* the Anti-Semites were beaten by the Liberals and Socialists. A strong ministerial majority was not indicated by this distribution of the seats. Hence the Premier attempted to negotiate with the Progressist group, with the object of forming a coalition majority, consisting of the Poles, the moderate Catholics, the Young Czechs, and such of the German Liberals as would join. He was anxious to dispense with the support of the Anti-Semites as well as the German Nationalists, and to remain independent of the reactionary Clericals. Failing in his plans, he and his associates offered their resignations on April 2, but they were induced to remain in office. The Austrian Social Democratic party were not disheartened at their defeat in the capital, where they contested all five districts, but showed the same confident hope that the future was theirs, and played shrewd politics as before, for instance, by collecting money at their sixth general congress, held in Vienna on June 6, to aid the street railroad strike then going on in the capital, although they had no share in organizing or influencing this strike, which, in so far as it was not due to the independent initiative of the strikers themselves, was the work of the Christian Socialist wing of the Anti-Semitic party. In this strike, although it interrupted the means of passenger transit in Vienna for some weeks, public opinion was on the side of the employees, who were encouraged by some members of the Reichsrath and supported by the municipal council, which warned the company of the

penalties they incurred by their failure to maintain the service. The company refused to reduce the working day from sixteen hours, or to pay certain classes of its servants more than 35 cents a day, or to grant them more than four Sundays or holidays in the year.

The new electoral law added a fifth estate to the four already represented in the Reichsrath—the great landowners with 85 representatives, the Chambers of Commerce and Industry with 21, the urban districts with 118, and the rural districts with 129. In the fifth *curia* only 15 out of the 73 Deputies are chosen by direct universal suffrage—9 from Lower Austria, and 1 each from Prague, Lemberg, Cracow, and 3 other cities. The remaining 58 are chosen by indirect suffrage, 1 elector being named for every 500 inhabitants. For the 15 seats filled by direct election the Christian Socialists polled nearly 248,000 votes and the Social Democrats nearly 219,000, while the Schoenerer party came next with 35,000, the German Nationalists after with 26,000, and then the Young Czechs with 20,000. In the indirect elections the Social Democrats polled the highest number, and after them Young Czechs, Poles, Ruthenians, and Christian Socialists.

On April 8 the municipal council of Vienna, by a vote of 93 to 39, elected Dr. Lueger for the fifth time burgomaster of the city. When elected on May 30, 1895, by a bare majority, he declined to accept office. He was elected again on Oct. 29, once more on Nov. 13 of the same year, and for the fourth time on April 18, 1896, but each time the ministry refused to ask the Emperor to confirm the election of the Anti-Semitic agitator. When Dr. Strohbach was chosen burgomaster Dr. Lueger accepted the office of vice-burgomaster. After the success of the party at the polls Dr. Strohbach resigned in order that his chief might be elected once more, and this time Dr. Lueger made none of the threats against the Jews, the Hungarians, and the Cabinet that had formerly rendered him obnoxious. The Emperor sanctioned his appointment, and he was sworn into office on April 20.

Race War in Bohemia.—In the session of the Bohemian Diet in February Graf von Coudenhove, the Governor, urged Germans and Czechs alike not to disturb the peace by mutual mistrust, promising that nothing in the nature of educational or national legislation would be undertaken without previously consulting the representatives of the two nations. A representative of the feudal landlords promised that they would assist in promoting a final settlement as soon as they found a harmonious feeling growing between the two races. Herr Lippert declared that the Germans would readily support any efforts for the establishment of friendly relations; previously, however, the position of the German-speaking population would have to be clearly defined. Dr. Herold, speaking in the name of the Czechs, declared that so long as equal rights were not given to both languages over the whole kingdom they could make no concessions. The resistance of the Germans to the demands of the Czechs removed the last differences between the Old Czech party and the aggressive and uncompromising Young Czechs, whose organization had already swallowed up the bulk of the old party of moderation and compromise, the remaining leaders of which now accepted the defiant programme of the stalwart champions of the restored Bohemian nation. The combined factions before the general election put forth a firm demand for the official use of the Czech language in the courts and administrative offices of Bohemia, Moravia, and Austrian Silesia on exactly the same footing as German. They also urged that the Emperor, when he celebrated the fiftieth anniversary of his ascent of the

throne, should come to Prague and solemnly assume the crown of St. Wenceslaus and the dignity of King of Bohemia.

In the new Reichsrath the united Czechs formed a more powerful and numerous group than the Young Czechs had in the last, and the Badeni ministry was more dependent on Czech support than it ever had been. Hence the long-expected and halfway promised decree of lingual equality could no longer be refused. An administrative ordinance was issued, directing that Czech should be employed on an equality with German as an official and judicial language throughout the Kingdom of Bohemia and the Margravate of Moravia.

The Young Czechs made their support of the Badeni ministry conditional on the full co-ordinate use of the two languages, Czech and German, in the judicial and official administration of Bohemia. Count Badeni therefore prepared a project, according to which, after a period of seven years, every Government official in Bohemia must be acquainted with both languages, and judges must dispense justice in either tongue at the request of the parties concerned. The German Deputies for Bohemia declared this to be a gross infringement on the interests of the German-speaking Bohemians, and the German landowners, upon whom Count Badeni had reckoned, refused to separate from the other German factions. Nevertheless the ministerial decree was issued providing for the concurrent use of both languages.

The Czechs have worked and striven hard for national recognition during the thirty years that have elapsed since Count Beust first promised, after Sadowa, to give Bohemia her virtual independence and Franz Josef planned to be crowned King of Bohemia and reign over a triple instead of a dual monarchy. Count Andrassy preserved the dual monarchy, and for a long time the Czech ambition was thwarted. During these years of deferred hope the Czechs have earned the racial and lingual supremacy that they have practically achieved. Socially and industrially they have risen to the level of their German competitors, and in political earnestness and discipline they have excelled them. Even in intellectual life they are the equals of their former teachers and political masters. They have not only built up a powerful political party and shown the capabilities of their formerly neglected and despised tongue for oratory and journalistic warfare; they have created a literature also, and even a musical school of their own, and in the fields of science, scholarship, and philosophy the Germans can scarcely still maintain that the Czech is not a *Cultursprache*, a literary language. Nevertheless the language ordinance of the Austrian ministry permitting this language to be used in courts of law and public offices, roused the Germans to such a pitch of uncontrollable fury and violence as the Young Czechs in their wild period of storm and stress never had displayed. The language war between the two populations was already severe enough over the question of education. In some districts Germans, in others Czechs, could not have their children taught in their own language. Cultured Czechs who had received their whole education in German would not have their children taught even its rudiments. In Prague German inscriptions have been erased from monuments, and that language is seldom heard. In many villages it is interdicted in the public schools under the law that requires the language of instruction to be the one prevailing in the district, although there are several Czech villages which have requested that the children be permitted to receive instruction in German as well as in Czech. In other villages Bohemian is banished from the cur-

rieulum. After the issuance of the new language ordinance the Germans became fanatical in their hatred of the Bohemian Czechs, and the latter began soon to retort in kind. In Saaz the German ultras refused to attend mass, and the burgo-master called the prior of the Capuchin monastery to account because divine service was performed in Czech. In the neighborhood of Eger the German-speaking farmers discharged their Czech laborers and servant maids by wholesale, Czech tenants were evicted from their houses, and the railroad officials of that nationality found their life so unbearable that they petitioned to be transferred. In the town of Eger the Czechs made the lot of their German fellow-citizens unhappy, refusing to sell to them, or to serve them in restaurants or beer halls, or to rent houses to them. In some places Germans were compelled to walk miles to and from their luncheon. In many German districts, on the other hand, the Czechs were given notice to quit their offices, service, and dwellings because of their language, were mocked in public or personally maltreated if they used it, and in many cases were driven from their homes and compelled to seek shelter where their fellows are in the majority. Bohemian sermons were forbidden to be delivered in some of the churches. In the mining town of Reichenberg the two sections of the population engaged constantly in street fights, and here, where formerly the German authorities refused to allow Czech inscriptions to be chiseled on the gravestones, the Germans usually had the worst of it. But the Germans were, as a rule, the more violent and vindictive, for the disturbance was a part of their tactics, and they were incited by vulgar agitators with whom their party leaders had refused to consort until the new category of democratic voters were added to the electorate. The executive committee of the Young Czechs published a manifesto protesting in the name of the Bohemian Deputies against the persecution of Bohemians, especially the brutalities practised by fanatical Germans against the Bohemian minority in the closed districts, where "the honor, lives, and liberty of Bohemians true to their descent have been endangered by violent and insolent acts unworthy of a civilized people."

The language question was carried into the Reichsrath by the German Nationalists, who checked all business by tactics of obstruction and disorder such as had never before been tried in Austria. On May 23, when the president, worn out by anxiety, had fainted, and the vice-president was in the chair, the Opposition overturned desks, flung books in the faces of speakers, indulged in coarse invectives, and finally resorted to blows and broke up the sitting in riot and disorder, crowding around the ministerial table and menacing the Premier with clenched fists, with cries of "Down with the Polish Badeni!" At a large representative gathering at Brünn in early June the Germans threatened a continuance of the parliamentary obstruction and of determined resistance to the ordinance respecting the official use of the Czech language, even to the point of refusing their contingent of recruits to the army. The Czechs at a convention at Königgrätz, held about the same time, manifested the fullest confidence in the ultimate success of their cause. While they declared themselves ready at all times to come to an understanding with the Germans on the basis of complete equality between the two nationalities, they did not consider it a favorable moment then to begin negotiations and, moreover, were not themselves disposed to take the initiative. A mass meeting of Germans announced to be held at Eger on July 11 for the purpose of protesting against the action of

the Government was prohibited by the imperial authorities. In defiance of this prohibition notwithstanding the reinforcement of the gendarmes of the little town by mounted police from Prague, and the dispatch of a detachment of military to avert the expected influx, a great number of Germans made their way into the place from all parts of Bohemia. Headed by the entire German Bohemian delegation in the Reichsrath, the procession forced its way in the town had in contemptuous disregard of the warnings of the local authorities. Several speeches were made before the police were able to disperse the meeting. The gathering reformed in procession in the streets and marched across the frontier to continue its deliberations on Bavarian soil. On the return of the demonstrators the streets were cleared by the police and military with drawn swords, several persons were wounded, and numerous arrests were made. The German citizens of Eger had decorated their houses for the occasion with black, red, and golden colors of the German Empire. The spokesman of the Deputies called upon the people to remain steadfast to their German nationality, and never to give up the fight until victory was won and the language ordinance withdrawn. In a German National meeting at Asch, on Aug. 22, Deputy Iro made speeches that led to his indictment on the charge of high treason. During the parliamentary vacation the Prime Minister invited the German Nationalists to a conference with the Conservative landed proprietors and those of the constitutional party and with the Young Czechs for the purpose of considering the measures by which he proposed to bring about an understanding between the German and Czech nationalities. The German representatives refused to enter into any negotiations until the language ordinance should be withdrawn, basing their refusal upon the alleged incompetence of the ministry to issue such an ordinance.

Autumn Session.—The first session of the Reichsrath elected under the reformed suffrage was brought to an abrupt close on June 2. The violent interruptions and obstructive tactics of the German Nationalists, aided by the Socialists, prevented any business being done. The Prime Minister, stating that such proceedings were contrary to the provisions of the Constitution, prejudicial to the interests of the state, and calculated to undermine the fundamental principles of parliamentary institutions, and that it was a necessity of state to put an end to such a condition of affairs, declared the session closed. This course had never before been adopted except as a preliminary to dissolution, and it took the opponents of the Prime Minister by surprise. The Germans attributed the action to a desire to check their activity in the constituencies by depriving them of their constitutional immunity as Deputies, which a mere prorogation would have left intact. Before the Reichsrath came together again Count Badeni met the representatives of the parties forming the Slav Clerical majority, and received from them assurances of their continued support without conditions.

When the Reichsrath reassembled, on Sept. 23, Count Badeni was greeted with a hostile demonstration by the Schoenerer group, which cheered for the German people when cheers were called for the Emperor Franz Joseph. A series of motions was offered aiming at the impeachment of the ministers. The German Nationalists demanded the impeachment of Count Badeni, because of the conduct of the Government officials at public meetings. The German Radicals and the Schoenerer group wanted him impeached for prohibiting the mass meeting at Eger, and called for the impeachment of Count Glaspach, Minister of Justice,

Dr. Bilinski, Minister of Finance, and Baron Glanz d'Horm, Minister of Commerce for exceeding their powers in the issuance of the decree authorizing the official use of the Czech language in Bohemia and Moravia. On the following day Dr. Wolf, the German Nationalist leader, who on May 8 had fought a duel with the Czech Deputy Horna, provoked a challenge from Count Badeni by insulting epithets, characterizing as blackguardism the alleged introduction of policemen into the house disguised as ushers. Although dueling is a violation of the Austrian criminal law, the Emperor approved the course of the Premier, and refused to accept his resignation. In the duel, which was fought the next morning, Count Badeni was wounded by a pistol bullet, which plowed its way along the whole length of his arm. The Opposition in the Reichsrath voted not to elect the 40 members provided by the statutes from the Unterhaus to the Austrian Delegation until they had settled their difficulties with the Government. There were five motions for the Premier's impeachment before the Reichsrath. The German and Anti-Semitic members declared that the Government intended to prorogue Parliament as soon as the Delegations were chosen, and enact the remaining legislation by despotic ministerial edicts. The stormy and disorderly meetings of the Unterhaus continued. On Oct. 19 the sitting was suspended after a band of deputies had surrounded the chair and assaulted their presiding officer. The outrages of the German obstructionists finally forced Thomas Kathrein, the president of the Unterhaus, to resign on Oct. 26. The budget for 1898, based on the new system of taxation, made the total revenue 719,900,000 florins, which was 29,760,000 more than in the preceding year. The expenditure was computed to reach about 715,000,000 florins. The new ground tax was expected to bring in 28,700,000 florins, as compared with 32,700,000 florins in 1897; the tax on buildings, 31,100,000 instead of 33,300,000 florins. From the new personal income tax a revenue of 15,600,000 florins was looked for, from the tax on *rentes* 3,100,000 florins, from the tax on salaries 310,000 florins. In the supplementary budget reckoned as permanent investment the sum of 29,000,000 florins was set down, to be raised by a 34-per-cent. loan, and expended in discharging debts incurred for extraordinary purposes, and for domestic improvements in general, chiefly in constructing new railroads and equipping the old ones. The adoption of the budget and the renewal of the Austro-Hungarian *Ausgleich* were the only indispensable acts required of the Reichsrath. The Government resorted to all-night sittings in the hope of rendering the Opposition physically incapable of keeping up the obstruction. In the nocturnal sittings the scenes of turbulence and disorder grew worse, and the debates degenerated into an exchange of insulting epithets and personal abuse. Herr Lecker, on the Government side, stretched out one speech for twelve continuous hours. The Government, which is empowered to suspend the Constitution temporarily by one of the articles of that instrument, could carry on most of the public business without the help of the Reichsrath, but Count Badeni was reluctant to resort to this extreme course.

Hungary.—The Hungarian Reichstag consists of the Table of Magnates, in which 19 archdukes, 181 hereditary peers paying 3,000 florins in direct taxes, 41 dignitaries of the Roman and Greek Churches, 11 representatives of the Protestant confessions, 84 life peers, 17 state dignitaries, and 3 delegates of Croatia-Slavonia have seats, and the House of Representatives, consisting of 413 members from Hungarian towns and rural districts and

40 delegates of Croatia-Slavonia, elected for five years by all male citizens twenty years of age who pay a certain small house, land, or income tax or possess educational or professional qualifications. There were 821,241 electors in 1895, being 1 in every 18 inhabitants. Croatia-Slavonia has a provincial Diet of 90 members to legislate on local affairs.

The Hungarian Cabinet at the beginning of 1897, first constituted on Jan. 15, 1895, contained the following members: President of the Council, Baron Desiderius Banffy; Minister of Finance, Dr. Ladislaus de Lukacs; Minister of National Defense, Baron Geza Fejervary; Minister at the King's Court, Baron Samuel Josika; Minister of the Interior, Desiderius de Perczel; Minister of Education and Worship, Dr. Julius de Wlassics; Minister of Justice, Dr. Alexander Erdely; Minister of Industry and Commerce, Baron Ernest de Daniel; Minister of Agriculture, D. Ignatius de Daranyi; Minister for Croatia and Slavonia, Emerich de Josipovich.

Finances.—The budget estimates for 1897 make the total ordinary revenue 465,191,881 florins, and the transitory revenue 10,134,424 florins; total from all sources, 475,326,305 florins. Of the ordinary receipts 307,582,306 florins are from the Ministry of Finance, 132,407,875 florins from the Ministry of Commerce, 16,668,565 florins from the Ministry of Agriculture, 1,434,717 florins from the Ministry of the Interior, 800 florins from the ministry *ad latus*, 793,660 florins from the Ministry of Justice, 347,180 florins from the Ministry of Defense, 1,611,668 florins from the Ministry of Education and Worship, and 4,345,100 florins from state debts.

The total ordinary expenditure was estimated at 441,275,181 florins, transitory expenditure at 8,013,952 florins, the total of investments at 19,051,651 florins, and extraordinary common expenditure at 6,897,886 florins, making the total expenditures 475,238,670 florins. Of the ordinary expenditures 4,650,000 florins are for the civil list, 79,500 florins for the Imperial Chancery, 1,775,043 florins for the Reichstag, 27,881,803 florins for the contribution to common expenditures, 26,416 florins for pensions charged to the common account, 8,350,374 florins for Hungarian pensions, 129,031,474 florins for the national debt, 13,671,681 florins for debts of guaranteed railroads that have been acquired by the Government, 499,078 florins for guaranteed railroad interest, 8,356,364 florins for the administration of Croatia, 148,548 florins for the office of the Accountant General, 240,987 florins for the administration of courts of justice, 440,460 florins for the presidency of the Council, 70,808 florins for the ministry *ad latus*, 43,078 florins for the Ministry for Croatia-Slavonia, 16,447,501 florins for the Ministry of the Interior, 75,197,236 florins for the Ministry of Finance, 93,514,166 florins for the Ministry of Commerce, 17,607,512 florins for the Ministry of Agriculture, 12,140,122 florins for the Ministry of Public Instruction and Worship, 15,966,402 florins for the Ministry of Justice, and 15,136,628 florins for the Ministry of Honved.

The Session of Parliament.—A conflict arose between the ministry and the Opposition, and was prolonged for many weeks by means of obstructive tactics similar to those practiced in the Austrian Reichsrath. The matter at issue was a clause in a bill amending criminal procedure and trial by jury. The bill provided that in future newspaper libel cases should be tried before a judge alone without a jury. This the Opposition held to be an infringement on the liberty of the press. The Government refused to modify the bill, but temporarily withdrew it on encountering determined obstruction, and in its place brought in a bill for the extension for one year of the sugar bounty system. The Opposition, however, would not allow any progress to

be made with this or any other measure until the Government consented to modify or permanently withdraw the objectionable clause in the jury bill. At last, on July 30, the Government consented to a modification of the clause, and the Opposition in return promised to cease obstruction then and not to have recourse to it during the remainder of the session on the discussion of the provisional arrangement of the Austro-Hungarian compromise question and the voting of the provisional budget. When the question of the *Ausgleich* came up in October, Francis Kosuth urged the Government to take advantage of the Austrian chaos and try for Hungarian independence. Baron Banffy replied that the union of the two countries must be regarded as indissoluble, but should the Austrian Constitution break down Hungary would be obliged to act independently regarding the questions of the customs and commercial treaty and the charter of the Austro-Hungarian Bank. It is the view of most Hungarian politicians that if parliamentary government ceases in Austria or if the federal system is established there the present union will by that fact be abrogated and the only remaining tie between the two monarchies will be the sovereign.

Agrarian Socialism.—The theories of socialism have not been ripe hitherto in Hungary, as they have been for many years among the laboring classes of Austria and Germany. They have not permeated the rural population of those or any other countries, nor have the Hungarian peasantry been prone to the phases of agrarian discontent that have cropped up elsewhere in Europe, or used to holding conventions to discuss their condition and voice their grievances. Hence the Agricultural Laborers' Congress that met at Buda-Pesth in the beginning of February, 1897, was a novel and a singular phenomenon, and its most singular aspect was its distinctly socialistic cast. It revealed the existence of an agrarian movement of a serious character among a part of the Hungarian peasantry, differing from the peasant movement in Galicia in many respects, and starting spontaneously from the bosom of the peasant community instead of being fomented by any popular agitators, or guided by men of enlightenment and culture, such as Father Stojalowski. There was no lack, however, of forcible and eloquent pleaders of their cause, for every Hungarian is a born orator, and the villagers are practiced in political and electioneering arts. At the congress several addresses were delivered that were worthy of the Reichstag, and they attracted the attention of politicians of note. The members of the congress declared that, in case the authorities should continue to place obstacles in the way of the organization of the Agrarian Socialist party, they would form a secret society and bring about a general strike if their demands were rejected. These were an increase of wages, a reduction of the hours of labor, and the abolition of the *corvée* system. The movement originated and had its principal seat in the midst of one of the most fertile parts of the Hungarian plain, a district where the land belongs to large proprietors and rich peasants. Its character was especially disquieting to the Hungarian authorities because advanced socialistic theories, involving atheism and the negation of patriotism, seemed to have taken deep root among the genuine Magyar population, formerly distinguished for strong attachment and devotion to the country and its institutions. The rapid spread of new theories among this landless population is easily accounted for, as the people here live in communities of from 20,000 to 30,000 persons, and while they find plenty of work in the summer and autumn on the farms and in the regulation of rivers, in the winter they have little to do and find plenty of time and opportunity

to discuss the hardness of their lot and listen to socialistic theories. Thus the doctrines of agrarian communism have made great progress in the lowlands between the Danube and the Theiss, although in other parts of the country they are unknown. The movement, limited as it was, caused anxiety in governing circles, where the opinion gained ground that legislative measures must be taken to provide redress for any legitimate grievances that the agricultural laborers have, though it was difficult to see in what form alleviation could be extended when the low prices of agricultural produce precluded a rise in wages, while a shortening of the hours of labor might prove disastrous in a country where the harvest has to be gathered in so short a time that work goes on day and night. These natural conditions made this agrarian socialism appear more serious and more troublesome to be dealt with by the authorities than socialism is in large industrial centers. An industrial strike, which is also quite unusual in Hungary, occurred in January at Temesvar, where the workmen employed in the Anina coal mines, belonging to the state railroad, organized a demonstration against an increase in their contributions to the benefit fund. An immense crowd, which included a large number of women, proceeded to the offices of the directors to protest against the change. When the gendarmes pressed them back, the men, incited by the women, hurled stones, one of which wounded a lieutenant. The gendarmes then fired, killing 9 and wounding 11 persons. The infuriated miners compelled the gendarmes and officials to take refuge in the Government building until they were rescued by a detachment of soldiers. To frustrate the threatened harvesters' strike the Government determined not only to use force when necessary to preserve the peace, but send a sufficient force of laborers to take the place of the strikers wherever the strike should break out. Early in June socialist riots occurred in the peasant communes of Nadudvar and Alpar, where the gendarmes fired on the disturbers, killing one man in each place and wounding a considerable number. In connection with these disturbances 21 persons were arrested as socialist agitators. Near the end of the month, in the height of the harvest season, an extensive strike occurred in the Alföld district, and the movement continued in spite of the introduction of outside laborers through the agency of the authorities and the premature intervention of the police, prior to any disturbance of the peace, with the object of coercing and intimidating the strikers. The Government labor reserve had little or no effect on the regular harvesters, who proceeded to carry out their threat of striking unless the employers acceded the terms demanded. The untrained imported laborers, on the other hand, proved inefficient and expensive, and were almost useless to the employers, who complained that the provisions made by the Government were useless, and that it was impossible to get their crops in properly with inexperienced hands, such as those provided. Some of the imported workers at the last moment declined to carry out their engagements, in consequence of threats of violence from the local agricultural laborers.

Peasant riots occurred in September in Croatia-Slavonia, where 4,000 men armed with scythes and pitchforks, after killing two Hungarian officials, took up a fortified position. Twelve districts were placed under martial law, and troops were sent to quell the disturbance, which here originated in a belief of the Croats that the Hungarian authorities intended to deprive them of their ancient privileges and forcibly convert them to Catholicism. When the signs of disorder appeared in April the Governor, Count Khuen Hedervary, revived the old

law of association, under which political societies may be dissolved and their funds confiscated, and even non-political societies suppressed unless they are specially authorized by the Government. In Slavonia the agrarian movement had at that time become so threatening that wholesale arrests were made among the peasantry and military precautions were taken against disturbances. While in Croatia proper the peasants are to a great extent the owners of the soil, in Slavonia, and particularly in the eastern parts, the land belongs to great proprietors. The landlords, many of whom own enormous estates, are absenteees, and where the land is owned by the cultivators, these are worse off than the tenant farmers, owing to the heavy mortgages they must carry. Owing to these causes a communitistic agrarian movement similar to that in Canada found a fertile soil in eastern Slavonia. The Government party has a large majority in the Agram Diet, but it is opposed by a noisy minority whose aim is separation from Hungary and the restoration of the dismembered kingdom of Croatia, embracing Croatia, Slavonia, Dalmatia, Bosnia, and Herzegovina, Fiume, and Istria.

Bourse Legislation.—The question of regulating the stock and produce exchange has engaged the attention of the Hungarian Government, which first sent its representatives to investigate the conditions prevailing in the principal bourse centers of Europe. Then a commission was constituted under the auspices of Baron Daniel, the Minister of Commerce, on which various financial, mercantile, and agricultural institutions, the Reichstag, and the legal profession were represented. The bourse of Buda-Pesth is an institution through which business in produce, as well as in stocks and shares, is transacted. Being the only establishment of the kind in Hungary, it plays an important part in the commercial and financial affairs of the country. The bourse committee, which has extensive administra-

tive powers, is elected from among the members, and the elections are afterward ratified by the Minister of Commerce. The decisions of the committee are final after they have been reviewed by officials appointed by the Government for the purpose, but the powers of these officials are limited to restricting the action of the committee to its prescribed sphere, within which its power is practically uncontrolled. The subjects to which the Government inquiry was directed were the position of the bourse in relation to the state, the composition of the bourse committee, the conditions regulating the terms of membership, and the disciplinary authority of the bourse authorities. The majority of the commission approved the intervention of the state for the regulation of the bourse and its methods of business. In the discussion of the second question the representatives of agrarian interests proposed that the committee should in future be composed partly of candidates elected by the members of the bourse and partly of candidates elected by agricultural associations having no direct connection with the bourse. This latter element they desired to add because the produce exchange exercises a preponderating influence on agriculture in general and upon the material welfare of the farmer and landowner in particular. Their opinion was opposed by the financial experts on the plea that all corporations, agricultural and others, that were in direct touch with the bourse were entitled to a voice in the election of the committee, but the adoption of the proposals of the agrarians would subject the decisions of the committee to outside control, which in the end would prove detrimental to all concerned. With regard to the third question the representative of the bourse committee advised the application of legal measures limiting the number of members who should be entitled to vote, and the exclusion of undesirable elements.

B

BAPTISTS. The American Baptist Yearbook for 1897 gives the following numbers for the Baptist churches in the United States: Number of associations, 1,567; of churches, 40,658; of ministers, 27,257; of members, 3,824,038; of persons baptized during the year, 172,433; of ministers ordained during the year, 504; of Sunday schools, 23,787, with 164,431 officers and teachers and 1,590,190 pupils; value of church property reported, \$84,039,959; amount of salaries and church expenses reported, \$8,106,769; of contributions for missions, \$1,232,621; of gifts for education, \$165,286; of miscellaneous gifts, \$2,214,682. Six hundred and sixty-two churches were organized during the year, and 351 church buildings dedicated. Thirty-three charitable institutions return property valued at \$1,525,721. One hundred and sixteen periodicals are conducted as representative of the Baptist churches and principles. For Baptists in the world, including America, Europe, Asia, Africa, and Australasia, are enumerated 47,363 churches, 31,825 ministers, and 4,573,264 members.

Home Mission Society.—The seventy-fifth annual meeting of the American Baptist Home Mission Society was held in Pittsburg, Pa., May 19 and 20. The Rev. H. Kirke Porter presided. The total receipts for the year had been \$422,428, of which \$297,329 were from the contributions of churches, Sunday schools, and individuals. The expenditures had been \$450,693, viz., \$202,308 for missionaries' salaries, \$84,469 for teachers' salaries, and \$50,377

for expenses of administration. The gross debt of the society on April 1, 1897, was \$214,694, toward the payment of which \$32,933 had been specifically subscribed, leaving a net indebtedness of \$181,761. In the missionary department 1,064 missionaries and teachers had been employed, of whom 254 missionaries and 21 teachers had labored among the foreign population; 47 missionaries and 216 teachers among the colored people; 17 missionaries and 21 teachers among the Indians; 17 missionaries and 5 teachers among the Mexicans; 4 teachers among the Mormons; and 452 missionaries among Americans. The missionaries had supplied 1,775 churches and stations, and reported 4,916 members received by baptism, 49,253 church members, 137 churches organized, 1,157 Sunday schools, with a total attendance of 68,379; and \$91,305 of benevolent contributions from the mission churches. The society aided in the support of 31 established schools for the colored people, the Mexicans, and the Indians, 11 day schools for the Chinese, and 1 day school in Utah, and 1 in New Mexico. The work among the Indians was confined almost exclusively to Indian and Oklahoma Territories. The work among the foreign populations was gradually assuming new aspects. Several of the churches called foreign had during the year become American, dropping their foreign tongue and using the English language in all their services. Much of the work done among these people was "foreign" now only in name. Probably the majority of German, Swedish, and

French missionaries under appointment spoke English readily, and did a large part of their work through the medium of the English tongue. The new plan of co-operation with the white and colored Baptists of the South, which went into effect in 1895-'96 in North Carolina and Alabama, had been extended to South Carolina and Virginia. The Southern brethren were desirous of having the plan put into operation in other States. The work of the schools for negro education in the South had been successful, and was continuing to exercise a wide influence in lifting the people up. Ninety-one churches in 26 States and Territories had been aided from the Church Edifice fund. A joint effort had been made by the committees of this society and of the American Baptist Missionary Union to extinguish the debts of the two societies, amounting, together, to \$486,000. Mr. John D. Rockefeller had offered to give \$250,000 to this purpose on condition that the societies should raise \$236,000. It was announced during the meetings of the societies that \$204,000 of the required amount had been subscribed. In view of this promise of success, a resolution was adopted: "That the happy and successful co-operation of the Missionary Union and this society in securing pledges of money for the liquidation of their debt and ours warrants the appointment of a committee of conference from the two societies, to report next year whether it is not possible to arrange a system of permanent co-operation in all the raising of funds for these societies."

Publication Society.—The seventy-third annual meeting of the American Baptist Publication Society was held in Pittsburgh, Pa., May 20 and 21. The Hon. Samuel A. Crozer presided. The society had had to bear during the year the disadvantages arising from the entire destruction of its publication house and its accumulated stock by fire in February, 1896; yet the result of the year's operations had been "more than satisfactory." The sales of the year had amounted to a total sum of \$607,397, while the other receipts of the publishing department had been \$11,595; receipts in the Bible department, \$12,799; in the missionary department, \$113,617. The deficit in the last department had been diminished from \$14,317 to \$11,374. On account of the much greater indebtedness of the Missionary Union and the Home Mission Society, and in order not to embarrass their efforts, no special attempt had been made to reduce this debt. The entire amount coming into the benevolent treasury of the society through the customary channels had been \$117,561; besides which \$8,855 had been received from bequests in the form of conditional gifts. One hundred and twenty-two new publications had been issued. It had been necessary further to reprint the entire list of the society's publications in order to replace the stock destroyed by the fire. Ninety-eight missionaries and workers had been employed in the missionary department, who had visited 38,771 families, and sold and given away 28,923 books, besides thousands of tracts, and who returned 387 persons baptized, 18 churches constituted, 258 Sunday schools organized, 997 institutes held and addressed, 113 Sunday schools aided by gifts of literature and Bibles, and 248 pastors and ministerial students aided with grants for their libraries. The interest in the chapel cars was represented to be increasing, and their usefulness constantly demonstrated. Six were now in operation. The society had raised in thirteen years \$246,455, or nearly \$19,000 a year for Bible work, and the whole sum had been expended on home and foreign fields. The work of revision of the Bible to which the society is pledged as the successor of the American Bible Union and of the American and Foreign Bible Society, was progressing.

Missionary Union.—The eighty-third annual meeting of the American Baptist Missionary Union was held in Pittsburgh, Pa., May 24 and 25. Dr. Henry F. Colby presided. The treasurer reported that he had received during the year from all sources \$467,102. The expenditures had been \$580,955, leaving a deficit of \$113,854, which, added to that already in existence April 1, 1896, \$163,827, made a total debt of \$277,681. The Executive Committee insisted in their report that the annual receipts were inadequate efficiently to maintain the work of the society in its present dimensions and methods. The situation anticipated in the previous year's report had been reached, viz.: "In case the debt shall be increased during the coming year, your committee see no alternative but that suggested by the secretaries of the board, of closing some of our missions or in some way curtailing the work." The subject had been one of frequent and earnest consideration by the committee, and they had deliberately concluded that the appropriations for the coming year should be made upon a scale about \$60,000 below those of the past year, and that in the years to come the average receipts from all sources for the five preceding years should be adopted as the basis of missionary appropriations for any single year. "To effect this will in heathen lands compel the actual abandonment of stations upon some of your mission fields with the result of missionary families; a serious reduction in the force of native workers upon others, besides such other curtailments in the furnishing of missionary equipment as can not fail to prove a serious embarrassment to the workers in the field, and, for a time at least, curtail progress. From several of our European missions it will involve the withholding of nearly one half the present appropriations and a considerable reduction of the work in France, with the possible withdrawal altogether from Spain. When the extent to which retrenchment has already been carried, and how disproportionate to the growth and prosperity of the work have been the offerings of the past five years, is taken into account, it must readily be seen that any line of action less drastic will fail to secure the relief demanded." The report of the Committee on Finance recommended to the Executive Committee such rearrangement and readjustment as might be consistent with the least injury to the missionary work, saying that "in the light of the experience of recent years we should deem it exceedingly unfortunate if the plans of the coming year should make it necessary to incur a new debt." The Executive Committee were advised to exercise the utmost economy, and the church members were exhorted to a more conscientious and considerate stewardship. A committee was appointed to confer with a like committee of the Home Mission Society with regard to further co-operation.

Progress in missionary work was noted in the Telugu mission, progress in self-support in that mission and in Burmah, and increased general spread of evangelical religion in France and Germany. The whole number of missionaries of the union was 452; of native preachers, 1,165; of churches, 823, with 99,564 members; of baptisms in 1896, 5,174.

Commission on Systematic Benevolence.—The first annual public meeting of the Commission on Systematic Benevolence was held in Pittsburgh, Pa., May 22. The Rev. T. S. Barbour presided. The report of the secretary recited that in order to render effective the undertakings of the commission (which was formed at the anniversary meeting of 1896 for the purpose of promoting unity in the benevolent work of the Baptist churches) it had been deemed essential to summon to cooperate with it three representative organizations now in

operation throughout the country, namely, the State conventions, the associations, and the local churches. The recommendations that had been made to these bodies were detailed. Bulletins concerning "Plans of Giving" had been issued, and documents containing various papers in regard to phases of the work. The one distinctive work of the year, as described in the address of the president, had been the initiatory steps in opening up channels of communication between the central commission and the great body of the churches. State boards had been formed. The immediate work now was that of extending the organization to each association; in every State a commission in touch with every church; in every church the adoption of some thoughtful plan of giving, the holding of a monthly service in recognition of the great joint enterprises represented in the denominational life, and the appointment of a church commission, which by the use of literature and personal effort shall seek to secure in every member conscientious, habitual fidelity in the discharge of the obligations of Christian stewardship; the use of a simple form of annual report by church, association, and State—thus to unify and promote intelligent development of the work. Report was made of the effort, in co-operation with the offer made by Mr. John D. Rockefeller, to secure payment of the debts of the Missionary Union and the Home Missionary Society, that the whole amount so far obtained was \$199,889.

Woman's Home Mission Society.—The twentieth annual meeting of the Woman's Baptist Home Mission Society was held in Pittsburg, Pa., May 17. Mrs. J. N. Crouse presided. The total amount of money in the treasury during the year had been \$66,156. The disbursements, including \$5,000 paid on the deficit and reinvested, had been \$69,478, and \$378 were on hand at the close of the year. The deficit thus appeared to be about \$3,700, but as \$2,000 of this sum was an emergency fund, the real deficit was \$1,700. The training school had graduated 21 students, of whom 15 were Americans, 3 Swedes, 1 Dane, and 2 Germans. The number of missionaries employed during the year had been the same as during the previous year, 130. The work was carried on among 11 classes of people in the United States, in 39 States and Territories, and at 85 stations. Free conferences were held during the meeting on the literature of the society, methods and services for collecting money, the training of girls to take interest in foreign and home missions, and the same among children.

Woman's Foreign Missionary Societies.—The twenty-sixth annual meeting of the Baptist Woman's Foreign Missionary Society was held in Washington, D. C., April 20 to 22. The general receipts for the year had been \$86,438, and the expenditures \$96,452. The receipts for the Home for Children of Missionaries and of Hasseltine House had in both cases been in excess of the expenditures. One hundred and twenty missionaries had shared the gifts of the society, 63 of whom were entirely supported by it, 11,126 pupils were enrolled in its schools, 167 Bible women had been engaged in their special work, and 743 baptisms were reported. More detailed reports were given of the school and other work in Burmah, among Eurasians, the Karens, Garos, Tamils, Telugus, in Pegu, and in India. The deficit in the general current accounts of the society having been reduced to \$8,500, a plan was prepared and adopted for extinguishing or further reducing it, without changing the schedule for the coming year.

The twenty-sixth annual meeting of the Woman's Baptist Foreign Missionary Society of the West was held in Cincinnati, Ohio, April 21 and 22. The en-

tire general receipts for the year had been \$56,810, and the receipts for the Home for Missionaries' Children \$1,806. The invested funds amounted to \$11,256. The work of the society in the foreign mission field—Burmah, Assam, Teluguland, China, and Japan—was represented by 40 missionaries, 1 assistant, 3 under appointment, 44 schools, 2,419 pupils, 115 teachers, 47 baptisms during the year, 68 Bible women, 4 Bible schools; and, in the medical department, 6 hospitals, 3 dispensaries, 5 helpers, 1,306 in patients, and 26,036 out patients. The whole amount appropriated for the missionaries was \$37,263. The appropriations to the foreign field and the home expenditures had all been cut down, and the States had been asked to fix their apportionments at such figures as could be reached. Four candidates for appointment as missionaries had been accepted, three of whom were already in the field. A correspondence school for candidates for mission fields, opened in 1883, had 85 students enrolled—6 during the past year—36 of whom had been graduated from one or more of its courses; and of these 24 had gone to the foreign field and 1 as a missionary among the Chinese in California. The Home for Missionaries' Children at Morgan Park, Ill., was full, and in need of a building.

Historical Society.—The American Baptist Historical Society having lost all its collections in the burning of the American Baptist Publication House in February, 1896, the annual meeting, May 20, was devoted most largely to expressions of sympathy and the presentation of its aims and needs. The president, the Rev. Dr. Lemuel Moss, defined the object of the society as being to collect and preserve all books, manuscripts, and documents relating to Baptist history, everything written by Baptists or in favor of Baptists, or in opposition to Baptists, and pictures, portraits, and mementoes. It was to have rooms in the new fireproof building of the Publication Society in Philadelphia, and needed \$25,000. Addresses were made by representatives of the several Baptist societies holding their anniversary meetings at Pittsburg expressive of the interest which their respective bodies had in the work of this society. A committee appointed in the previous year to encourage the study of Baptist history reported that it had secured the promise of historical papers to be published during the ensuing year, to be written by Dr. H. S. Burrage, Dr. Norman Fox, Dr. E. B. Hulbert, and Dr. A. H. Newman. The publication would be continued quarterly. Partial promises had been received from other Baptist scholars. Subscribers were invited to support the enterprise by the contribution of \$1 a year, in return for which they would receive the publications of the society.

Southern Baptist Convention.—The Southern Baptist Convention met in its fifty-second session at Wilmington, N. C., May 7. Mr. Jonathan Haralson was unanimously elected president. The Home Mission Board reported that the year had been one of the severest financial stress it had ever passed through. It had begun with an indebtedness of \$8,000 and an obligation to pay \$5,700 toward the purchase of a House of Worship in New Orleans, making a total indebtedness of \$13,700. The total amount of \$180,596 had been raised. All indebtedness had been discharged except \$4,500 due on the New Orleans House of Worship, and the year had closed with a balance of \$220 in the treasury. Three hundred and seventy-two missionaries had been employed, serving 1,963 churches and stations, who returned 4,709 baptisms during the year, 139 churches constituted, 57 houses of worship built and 129 improved, with an expenditure of \$52,040, and 313 Sunday schools organized, connected with which were 10,725 teachers and pupils. Nineteen

State and Territorial boards had co-operated with the General Board in part or the whole of their work. The Woman's Missionary Union co-operating with the board reported concerning the distribution of literature and supplies. Work among the negroes under the plan of co-operation of this board with the State boards and the American Baptist Home Mission Society was in operation in Alabama, North Carolina, South Carolina, and Virginia, with 14 missionaries employed. Forty young colored men were studying for the ministry. A course of lectures had been delivered in connection with the work at the Atlanta Baptist Seminary. The report expressed gratification at the progress made by the colored race, and especially at their enterprise in connection with Sunday schools. Work among the foreign population needed to be greatly extended. The enforced removal of all the pastors of the board from Cuba had left the missions there in the hands of the body of the membership, who had to maintain it against adverse conditions; yet the schools had been continued, religious services kept up, and new members added. Churches had been aided in 90 per cent. of the most important centers of population in the Southern States.

The Foreign Mission Board had received during the year \$125,682, and had expended \$107,314. It had been able to pay \$18,368 on its indebtedness, leaving the present debt \$13,533, against \$13,900 at the close of the previous year. Of the funds received at the office in Richmond, about 92 cents on the dollar went to the missionaries. Of the 8 per cent. thus chargeable to office expenses, 1.7 per cent. was for interest. Besides this, however, the State expenses in collecting funds amounted to about 5 per cent. before the money was sent to the central office, so that the total expense of collecting and administering the missionary money was 13 per cent. The Woman's Missionary Union had co-operated with the board by distributing literature and supplies. Four of the missionaries in China had drawn no salary during the year. Others of the missionaries did not accept full salaries. Report was made from the mission in Italy of work at a considerable number of stations. Five missionaries and their wives were engaged in Brazil, where 251 persons had been baptized, and the 18 churches returned 1,022 members; the churches in south Brazil had formed an association, and the Rev. C. Z. Taylor, during a two months' trip up the San Francisco river, had been well received everywhere by the better class of people. The South Brazil Baptist Association had engaged a home missionary, and had resolved to send a missionary to Africa. The mission in Mexico returned 6 missionaries and their wives, 3 single ladies from the United States, besides the native preachers, 29 churches with 1,116 members, and 112 baptisms during the year. A notable decrease of hostility was mentioned. Fifteen missionaries from this country with their wives and 10 single ladies, besides native pastors, were laboring in China, where were 20 churches with 1,364 members, 167 of whom had been baptized during the year, and 29 day schools. A strong and increasing religious interest was developing in this country. The mission in Japan included 3 missionaries and their wives, 1 church of 48 members, 8 of whom had been baptized during the year, and 10 Christians, including a native preacher and his wife at Fukuoka. Four missionaries and their wives were laboring in Africa, where 54 baptisms were reported, 25 of which were at the Ebenezer Church in Lagos, which had become self-supporting. Not all the schools mentioned in the reports receive help from the board. Only a small proportion of the funds of the board goes to the schools, and a part of

what is appropriated is specially sent for that purpose.

The Sunday-school Board during the six years of its existence had afforded help to the departments under its care in the distribution of Bibles, tracts, etc., to mission schools, payments to the Home and Foreign Boards and to Sunday-school missions in different States, purchase and equipment of a publishing house, etc., \$64,763. The board had been having its printing done by the establishment of another denomination, but, having determined to take immediate charge of it, had purchased a suitable building at a cost of \$11,000. It publishes a full list of Sunday-school periodicals, called the "Convention Series." The Colored Baptist National Convention had been using the plates of the expositions of the Sunday-school lessons published by this board, free of charge, for the publication of its Sunday-school literature, but had now established its own publication house at Nashville, Tenn.

The Young People's Union Auxiliary to the Convention met May 6, and adopted a plan of co-operation with the Young People's Baptist Union of America. The union is organized and active in all the States represented in the convention except Louisiana.

Considerable discussion had been going on during the past year in the churches represented in the convention concerning certain matters which had been published by Prof. W. H. Whitsitt, of the Southern Baptist Theological Seminary. In a historical article in "Johnson's Cyclopaedia" concerning the Baptists he had affirmed as the result of his investigations that "immersion was not practiced in England before as late a period as 1641." Exception was taken to this declaration by many Baptists, who held to the importance of an unbroken succession of immersions. A similar statement had been published in an article in the "Independent" newspaper, and in another article in that journal Dr. Whitsitt, it was alleged, had expressed approval of a Baptist woman who had married a man not a Baptist, going, under certain conditions, to her husband's church. The historical question raised by Dr. Whitsitt had been discussed in the convention of 1896, without reaching a conclusion. The trustees of the seminary afterward voted unanimously that Dr. Whitsitt had done and said nothing demanding notice at their hand. Again, May 6, 1897, the Board of Trustees adopted a declaration, after averring their loyalty to Baptist principles, "that we can not undertake to sit in judgment on questions of Baptist history which do not imperil any of these principles on which all Baptists are agreed, but concerning which serious, conscientious students are not agreed. We can, however, confidently leave to continued research and discussion the satisfactory solution of these questions. Believing the seminary to hold an important relation to the prosperity and usefulness of Southern Baptists, we consider it our duty, while demanding of those in charge of its departments of instruction the utmost patience in research and the greatest discretion in utterance, to foster rather than repress the spirit of earnest and reverent investigation." The resolution further invited reciprocal confidence between the Baptists of the South and the management of the institution. These resolutions were communicated to the convention, and with them a letter from Dr. Whitsitt explaining and modifying his articles in the "Independent," regretting any utterances objectionable to his brethren, but reaffirming his expressed historical opinions as unchanged. His explanations were accepted by the convention with enthusiasm, and the action in the matter of the trustees of the seminary was sustained.

National Colored Baptist Convention.—The National Colored Baptist Convention met in Boston, Mass., in September. The Board of Foreign Missions of the African reported that more than \$5,000 had been raised for the work, and about \$1,500 had been appropriated directly to it. These figures do not include the work of the Virginia churches, which is carried on independently. It was shown that during the past seventeen years the negro Baptists of America have raised \$36,546 for African missions. The report of the Home Mission Board concerned chiefly schools and publications, while little had been done in the way of church extension. The convention further considered the subjects of systematic beneficence, the Young People's movement, and a magazine.

Young People's Union.—The seventh international convention of the Baptist Young People's Union of America (United States and Canada) was held at Chattanooga, Tenn., July 15 to 18. Mr. J. H. Chapman presided. The annual report of the secretary showed that the union was organized in all of the States except Utah, Nevada, Wyoming, Idaho, Mississippi, and the Territory of New Mexico. The treasurer's reports showed an improved financial condition. The receipts for the year had been \$69,824, and the deficit had been reduced from \$4,820 to \$1,738. The number of examinations in the Christian culture courses, 13,407, showed an increase of 1,962 over the previous year. An arrangement for union with the Baptist Young People's Union Auxiliary to the Southern Baptist Convention made through committees in March, 1897, had been formally ratified, and was in effect during the present meeting. In place of the division of the Young People's Baptist Union of America into four departments, known respectively as the Departments of the Red, Gold, Blue, and Green, it was determined that the aggregation of societies within the Dominion of Canada should be designated the Baptist Young People's Union of Canada; that within the territory tributary to the Southern Baptist Convention as the Union South; that within the remaining States east of the Mississippi river as the Union North; and that within the remaining territory west of the Mississippi river as the Union West. The principal features of the convention consisted of the addresses which were delivered, among the subjects of which were: "The Christ Conception—Person, not Proxy," by the Rev. Dr. Carter Helm Jones; "Divine Ownership—Human Stewardship," by the Rev. Dr. D. D. MacLennan; "Education the Structural Idea," by the Rev. W. P. McKee; "Denomination our Conservative Idea," by the Rev. Dr. J. W. A. Stewart; "The Ideal Home and its Permanent Influence," by the Rev. W. W. Weeks; "The Stewardship of Service," by the Rev. Dr. B. A. Greene; "The Stewardship of Culture," by the Rev. Dr. C. S. Gardner; and "The Power of the Keys," the annual address of the president. Conferences of workers, department rallies, and other special meetings were held. The convention was attended by 3,200 delegates.

The Baptist Congress.—The fifteenth session of the Baptist Congress was held in Chicago, Ill., Nov. 16 to 18. The Rev. A. A. Kendrick, D. D., of St. Louis, Mo., presided. The congress is a voluntary meeting of Baptist ministers and laymen, without authority or formal representative character, the purpose of which is defined to be "to promote a healthful sentiment among Baptists through free and courteous discussion of current questions by suitable persons." The programmes of the meetings are prepared beforehand, and include a list of subjects on which papers are read by persons assigned to that function, which are in each case followed by remarks from appointed speakers,

after which opportunity is given for voluntary addresses. The subjects discussed at the present meeting were: "Are the Teachings of the Apostles of Equal Authority with those of Christ?" "Is Baptism a Prerequisite to the Lord's Supper?" "Should Denominational Beliefs impose Limitations upon Religious Teachers?" "Our Government and the Oppressed of Other Nations"; "The Psychology of Conversion"; and "The Power of the Cross in the Life of the Believer."

Baptists in Great Britain and Ireland.—The Baptist Yearbook for 1897 gives as the numbers of the Baptist churches in Great Britain and Ireland (including about 300 churches not reporting, for which estimates are made from previous years' returns) 2,924 churches, 360,112 members, 1,955 pastors, 4,838 local preachers, 3,822 chapels with 1,286,514 sittings, 50,721 teachers and 519,226 pupils in Sunday schools, and 16,113 baptisms during the year. Of these, 1,700 churches and 221,778 members were in England, 783 churches with 101,791 members in Wales, 108 churches with 15,698 members in Scotland, 28 churches with 2,487 members in Ireland, 4 churches with 337 members in the Channel Islands, and 1 church with 21 members in the Isle of Man. The figures in each department are in advance of those of the preceding year, the most prominent increase being that of membership—6,145. The amount expended during the year upon new buildings was £76,807, or £17,293 more than during the previous year; while £27,315 were upon chapel improvements, and £63,340 for the removal of debt on chapel property. A considerable increase is shown in the last item. The large number of local preachers is mentioned as an interesting feature in the statistics. With the exception of a few who are fully engaged as missionaries or evangelists, these local preachers are men who support themselves and their families by secular occupations and aid their pastors by preaching on Sundays and at other times at out stations, receiving no pay for these services. While many of the churches have no local preachers, a large number of them have from 1 to 20 each. Two report 22; one, 23; three, 25; one, 30; one, 44; and the Metropolitan Tabernacle in London returns 130. A paper on Baptist authors and history from 1527 to 1800, by the Rev. Dr. Joseph Angus, is published in the Yearbook. It gives the names of between 400 and 500 English Baptist authors, with some particulars about many of them, and the number of books published by each, with dates of publication. Abraham Booth and Andrew Fuller are credited in it with 40 works each; John Gill, D. D., with 45; and John Brine, J. Ryland, D. D., Dan Taylor, and W. Whiston with 50 each.

The Baptist Union of Great Britain and Ireland met in its annual meeting April 26. The address of the President, the Rev. E. G. Gange, bore special reference to the centenary of Baptist home missions, which was celebrated in connection with the present meeting. The report of the council showed an increase of 7 Baptist churches connected with the union, 6,145 members, 242 teachers, and 5,585 pupils in Sunday schools, and £18,960 in expenditure on new buildings and improvements, while building debts had been reduced or removed to the extent of £63,340 as against £57,392 in the previous year. The Board of Introduction had made 70 recommendations of ministers to churches without pastors. A Ministerial Recognition Committee had been formed, in accordance with proposals adopted at the previous annual meeting. The receipts of the General Expense fund had been £1,978; of the Church Extension fund, which now amounted to £9,491, £2,600. An increased activity in church extension was remarked in some

of the larger centers. The receipts of the Annuity fund had been £9,409. The fund had 650 beneficiary members, and 401 wives were subscribed for, while £6,673 had been paid in annuities during the year. The seventh triennial valuation of the investments belonging to the fund gave the purchase value as £174,527, showing an increase of £37,830.

About 30 English associations were co-operating with the council of the Home Mission Society in the home-mission work. Eighty-eight mission churches were on the list of the council, 50 of which were formed into 23 groups of two or three churches each. There were besides 25 mission stations, with 113 preaching places and 54 mission pastors. The number of communicants was 4,306, and of baptisms during the year 173. An historical sketch of the home missions, published in connection with the centenary celebration, showed that they were begun in July, 1796, when two ministers started from Plymouth on an evangelistic tour through Cornwall, under the direction of the Baptist Missionary Society. An "Address to the Friends of Evangelical Truth in General and to the Calvinistic Baptist Churches in Particular," by the Rev. Abraham Booth, issued in 1797, announced the formation of the Baptist Society in London for the Encouragement and Support of Itinerant and Village Preaching. This society did good work in many counties. It held its first public meeting in 1814. The name of the society was changed in 1817 to the Baptist Itinerant and Home Missionary Society. The income of the society in 1835 was £2,000; in 1841 it had risen to more than £5,000; but, except in 1845, when it rose to £5,901, had never since reached £5,000.

The capital of the Baptist Building fund stood at £31,578. Thirty-nine churches had been aided by loans of from £40 to £1,000 each, and for different terms of years to the total amount of £12,010.

The Bible Translation Society had received £1,300 during the year, all of which had been expended, except a balance of £57. The Legacy fund amounted to £1,000.

The year's sales of the Tract and Book Society had amounted to £1,622, £427 more than the sales of the previous year, which had been much larger than those of previous years; the subscriptions amounted to about £800. A balance of £120 was due the treasurer.

The income of the Baptist Missionary Society for 1896 was £75,978, the largest ever received by the society in any one year of its history except the centenary year. Of this amount, £11,186 had been contributed in response to an appeal for relief of the districts in India that were suffering from famine. The contributions to the general fund showed an advance of £2,083 over those of the previous year, with an additional £1,571 for the Thanksgiving fund, while the special gifts were £1,341 more than those of the year before. There had, however, been a falling off of £9,789 in the amount received from legacies. The expenditures had increased £3,947.

The year's receipts of the Baptist Zenana Mission had been £7,635. The association had 56 missionaries and 205 native Bible women and school teachers in India visiting regularly about 1,220 zenanas and several hundred houses in which the Bible is used.

The autumnal session of the union was held at Plymouth, beginning Oct. 6, the Rev. E. G. Gange presiding. Resolutions were adopted reiterating the protests of the union against state aid to denominational schools, and insisting on the extension of the school-board system to the whole country, the absence of denominational formularies from religious instruction in public elementary schools,

and the establishment of training colleges which shall impose no religious tests; favoring peaceful arbitration as a means of settling national disputes; condemning state regulation of vice in India and the toleration of slavery in countries under British protection; advising a movement for the extension of the Sunday closing of liquor shops over the whole of England; and regretting the spread of priestly pretensions and sacramentarian superstitions, and calling on all Christians to uphold the sole mediocrity of Jesus Christ. The consideration of a temperance resolution, embodying clauses advising the election of abstainers as deacons and other church officers, and declaring it inconsistent to solicit or receive financial aid from persons engaged in the manufacture or sale of intoxicants, was objected to as bearing against persons who were not present to defend themselves, and the subject was referred to the council with a view to its being brought forward again at the spring meeting of the union, 1898. The subjects were considered in papers and general discussions of the attitude of the churches toward Roman Catholicism, the Chautauqua movement, Christian Endeavor societies, and Free Church principles. Conferences were held of lay preachers and on Sunday schools, and meetings in behalf of the Baptist missionary and benevolent enterprises.

BELGIUM, a constitutional monarchy in Western Europe, founded in 1830, when it seceded from the United Netherlands. Its territory was declared neutral and inviolable by the Treaty of London, made on Nov. 15, 1831, by Austria, England, Prussia, and Russia. The constitutional amendment of Sept. 7, 1893, changed the manner of electing Senators, who were formerly elected directly. Now part are elected directly, and part by the provincial councils. There are half as many Senators as there are members of the House of Representatives. Senators elected directly are required to have an income of 12,000 francs from real estate, or pay 1,200 francs of direct taxes a year. The provincial councils in provinces having less than 500,000 inhabitants elect 2 Senators; if above that population, up to 1,000,000 they elect 3; and provinces of more than 1,000,000 inhabitants elect 4 Senators. The term of a Senator is eight years, one half retiring every four years. The House of Representatives are elected in districts having not fewer than 40,000 inhabitants for four years by the direct vote of the qualified voters. Every two years one half of the chamber is renewed. Every citizen over twenty-five years of age, resident in the commune for a year, and not disqualified by crime or pauperism, has one vote; owners of real estate worth 2,000 francs or having Belgian funds or savings-bank deposits yielding 100 francs a year, also married men or widowers with children, who are thirty-five years of age and pay at least 5 francs of house tax, are entitled to an additional vote; and one or two supplementary votes can be cast by university graduates, professional men, and officials or ex-officials, no citizen being entitled to more than three votes at any election.

The Cabinet, first constituted on Oct. 26, 1884, was composed at the beginning of 1897 as follows: President of the Council and Minister of Finance, P. de Smet de Naeyer, appointed Feb. 25, 1896; Minister of Foreign Affairs, P. de Favereau, appointed Feb. 25, 1896; Minister of Justice, V. Bogaers; Minister of Railroads, Posts, and Telegraphs and Minister of War *ad interim*, J. H. P. van den Peereboom; Minister of the Interior and Minister of Public Instruction, M. Schollaert, appointed May 25, 1895; Minister of Agriculture and Public Works, L. de Bruyn; Minister of Industry and Labor, M. Nyssens, appointed May 25, 1895.

Area and Population.—The area of Belgium is 11,676 square miles. The population on Dec. 31, 1895, was estimated at 6,410,783, composed of 3,198,567 males and 3,212,276 females. The number of marriages in 1895 was 49,712; of births, 183,015; of deaths, 125,148; excess of births, 57,867. The population of Brussels, with suburbs, at the beginning of 1895 was 518,387. Antwerp had 262,255; Liège 161,297, and Ghent 157,214 inhabitants. There are 6,655 public primary schools, with 720,191 pupils; 1,431 infant schools, with 142,384 pupils; and 1,797 adult schools, with 69,270 pupils. Every commune is required to maintain at least one primary school. The provincial and national governments grant subventions. The total cost of elementary education in 1894 was 30,322,383 francs. About 27 per cent. of the population over fifteen years of age could not read nor write in 1890. Out of 63,113 young men called out in 1896 for military service 22,911 had more than a rudimentary education, 31,141 could merely read and write, 1,284 could only read, 7,129 could neither read nor write, and of 648 no return was given.

Finances.—The revised budget for 1897 makes the ordinary revenue 386,923,178 francs. Of this sum 25,276,000 francs are derived from taxes on property, 19,846,000 francs from personal taxes, 7,270,000 francs from trade licenses, 400,000 francs from mines, 36,116,632 francs from customs duties, 52,420,297 francs from excise, 20,475,000 francs from succession duties, 19,850,000 francs from registration taxes, 6,500,000 francs from stamps, 5,778,000 francs from various indirect taxes, 1,579,000 francs from canal tolls, 154,000,000 francs from railroads, 6,730,000 francs from telegraphs, 12,649,500 francs from the post office, 1,435,000 francs from pilotage dues, 3,178,500 francs from domains and forests, 9,358,900 francs from funds and securities, the national bank, etc., and 4,060,349 francs from repayments. The total ordinary expenditure was estimated at 386,295,842 francs, of which 113,659,819 francs are for interest and sinking fund of the debt, 4,865,200 francs for the civil list and dotations, 21,594,240 francs for the Ministry of Justice, 2,806,014 francs for the Ministry of Foreign Affairs, 26,432,385 francs for the Ministry of the Interior and Public Instruction, 23,171,149 francs for the Ministry of Agriculture and Public Works, 116,438,585 francs for the Ministry of Railroads, Posts, and Telegraphs, 48,381,375 francs for the Ministry of War, 19,069,415 francs for the Ministry of Finance, 1,926,030 francs for the gendarmerie, and 3,095,060 francs for the Ministry of Industry and Labor.

The ordinary revenue for 1894 was 362,600,000 francs, and the extraordinary revenue 42,589,000 francs; total, 405,185,000 francs. The ordinary expenditure in that year was 353,340,000 francs, and the special expenditure 49,219,000 francs, making a total of 402,559,000 francs. The revenue of the provincial administrations in 1894 amounted to 15,225,500 francs, and their expenses to 14,069,000 francs. The revenue of the communes from ordinary sources amounts to about 118,000,000 francs a year, besides which 60,000,000 francs or more are expended for extraordinary purposes.

The public debt was raised almost entirely for railroads and other useful and reproductive public works. The capital amount in 1895 was 2,246,366,647 francs, of which 2,006,407,015 francs pay 3 per cent. interest, 219,659,632 francs 2½ per cent., and 20,000,000 francs are redeemable treasury bonds.

The Army.—The Belgian defenses consist of the central arsenal of Antwerp, with the fortified towns of Dendermonde and Diest, the fortifications at Mons, Tournai, and Ypres, guarding the French frontier, and those at Liège, Huy, and Namur, with those of

the scheme of 1887 for the further fortification of the line of the Meuse. Every able-bodied Belgian on reaching the age of nineteen is liable to conscription, but substitution is permitted. The annual recruit is about 13,300 men. The period of service is eight years, though not more than two or three years of actual service with the colors are required. The strength of the army on the peace footing in 1895 was 3,515 officers and 48,165 men. Of the total, 1,923 officers and 27,738 men were in the infantry, 379 officers and 5,849 men in the cavalry, 467 officers and 8,215 men in the artillery, 94 officers and 1,534 men in the engineers, 64 officers and 2,522 men in the gendarmerie, and 588 officers and 2,307 men attached to the general staff, administrative corps, military school, and other establishments. The artillery is armed with 200 guns, in war time with 240. There are 7,200 horses for the army and 1,636 for the gendarmerie. The war strength of the army is 3,505 officers and 163,082 men, with 14,000 horses. In addition there is the Civic Guard organized, in the towns, numbering about 43,000 men.

Commerce and Industry.—Most of the land of Belgium is divided into small parcels, which are highly cultivated by farmers or by the owners. The proportion of cultivators owning their land is increasing. Of the total area of the kingdom, 67 per cent. is under cultivation and 17 per cent. is forest. The agricultural class forms about 22 per cent. of the total population. Wheat, rye, oats, and the sugar beet are the principal crops. Tobacco was raised to the amount of 5,166,000 kilogrammes in 1895. The raw sugar produced in 1895 amounted to 182,178,000 kilogrammes; refined sugar, 65,662,000 kilogrammes. The distilleries produced 628,340 hectolitres of proof spirit. There were 118,957 persons employed in the coal mines in 1895. The number of women working underground decreased from 2,172 in 1893 to 1,628 in 1895. The production of coal in 1895 was 20,451,000 tons, valued at 193,357,000 francs. The iron mines produced 312,637 tons of ore, and 1,942,900 tons of iron ore were imported, mostly from Luxemburg. The production of pig iron was 829,234 tons, valued at 40,207,000 francs; of manufactured iron, 445,899 tons, valued at 55,729,000 francs; of steel ingots, 407,634 tons, valued at 31,018,000 francs; of steel rails, etc., 367,918 tons, valued at 42,419,000 francs. The zinc product was 38,496,000 francs in value; lead, 4,203,000 francs; silver, 3,430,000 francs.

The value of imports in the general commerce of 1895 was 2,904,948,026 francs, of which 1,397,293,169 francs constituted the ocean trade and 1,507,654,857 francs the railroad and river traffic. The general exports amounted to 2,424,560,429 francs, of which 1,154,157,499 francs represent goods shipped from the ports and 1,450,705,084 francs the amount sent by land and river. The total value of the imports for domestic consumption was 1,680,400,000 francs; of the domestic exports, 1,385,400,000 francs; of the transit trade, 1,219,400,000 francs. The special imports of cereals were 268,292,000 francs in value; raw textile materials, 155,543,000 francs; drugs and chemicals, 95,105,000 francs; resins and gums, 85,457,000 francs; timber, 66,411,000 francs; woolen, cotton, and silk tissues, 64,059,000 francs; oil seeds, 59,462,000 francs; mineral substances, 59,458,000 francs; hides, 59,037,000 francs; coffee, 55,174,000 francs; metals, 50,357,000 francs; animal products, 38,958,000 francs; live animals, 37,791,000 francs; meat, 32,833,000 francs; wines, 32,792,000 francs; coal and coke, 30,263,000 francs; linen and woolen yarns, 23,338,000 francs; fertilizers, 20,612,000 francs; machinery, 19,518,000 francs; butter, 18,868,000 francs; flour, 18,785,000 francs; tobacco, 12,090,000 francs. The special exports of linen,

wool, and other textile yarns were valued at 106,282,000 francs; coal and coke, 87,726,000 francs; textile materials, 80,643,000 francs; tissues, 72,430,000 francs; hides and leather, 65,551,000 francs; chemicals and drugs, 62,892,000 francs; cereals, 62,821,000 francs; machinery and carriages, 61,780,000 francs; meat, 52,877,000 francs; iron, 52,370,000 francs; glass, 50,954,000 francs; sugar, 48,000,000 francs; steel, 47,006,000 francs; animal products, 36,028,000 francs; mineral substances, 35,320,000 francs; zinc, 31,794,000 francs; fertilizers, 27,850,000 francs; horses, 27,288,000 francs; bitumen, 24,447,000 francs; dyes and colors, 22,430,000 francs; oil seeds, 22,205,000 francs.

The foreign countries participating most largely in the Belgian trade and their respective shares in the special commerce of 1895 were as follows, values being given in francs:

COUNTRIES.	Imports.	Exports.
France.....	259,856,000	284,220,000
United States.....	132,552,000	46,650,000
Great Britain.....	123,130,000	266,700,000
Netherlands.....	174,602,000	165,004,000
Germany.....	190,195,000	310,760,000
British India.....	82,905,000	20,367,000
Russia.....	116,910,000	21,510,000
Romania.....	100,108,000	9,028,000
Argentine Republic.....	92,063,000	14,353,000
Sweden and Norway.....	46,148,000	15,474,000
Brazil.....	41,145,000	21,850,000
Italy.....	19,854,000	25,323,000
Peru.....	26,733,000	1,407,000
Australia.....	21,171,000	5,605,000
Spain.....	20,339,000	21,932,000
Chile.....	28,274,000	7,710,000
Egypt.....	3,537,000	9,913,000
Switzerland.....	27,748,000	34,103,000

Navigation.—During 1895 there were 7,249 vessels, of 6,858,237 tons, entered at the ports of Belgium, and 7,227, of 6,811,765 tons, cleared. Of those entered, 3,867, of 2,569,024 tons, arrived from English ports, and 266, of 543,247 tons, from the United States, and of those cleared 4,960, of 4,046,331 tons, were bound for English and 224, of 548,776 tons, for American ports. The merchant marine at the close of 1895 comprised 5 sailing vessels, of 917 tons, and 54 steamers, of 86,296 tons.

Communications.—The railroads of Belgium had a total length at the beginning of 1896 of 2,839 miles, of which 2,044 miles were managed by the Government and 795 miles by companies. There were 76,937,198 passengers transported in 1895 on the state lines and 22,662,735 by the companies. The gross earnings of the state lines were 154,467,350 francs, and the expenses 90,436,312 francs. The total cost of the Government railroads was 1,413,057,543 francs. The net receipts from 1835, when the first railroad began running, till the close of 1895, amounted to 1,505,187,060 francs, and during the same period the sum of the fixed charges has been 1,437,038,840 francs.

The post office in 1895 carried 109,921,305 private and 20,786,583 official letters, 45,177,886 postal cards, 89,061,193 circulars, etc., and 110,695,323 newspapers. The receipts were 19,712,524 francs; expenses, 10,586,960 francs.

The telegraph lines in 1895 had a total length of 4,045 miles with 19,645 miles of wire. The number of messages sent in 1895 was 8,515,157; receipts, 4,900,693 francs; expenses, 4,867,971 francs.

The Flemish Question.—The principal question brought before the Parliament in the session of 1897 was that of the official rehabilitation of the Flemish tongue. Deputies Coremans and de Vriendt introduced a bill making Flemish equal with French the official language of Belgium. The literary revival of the Flemish tongue and the reawakening of historical memories and local or

racial pride of the Flemings, followed by their triumph in religious and political matters over the Liberalism of the French school that formerly held sway and gave the Walloons a preponderant influence, naturally suggested the elevation of their national tongue to an equal place beside the French as one of the parliamentary and legal languages of the country. The way was prepared by a long agitation conducted by their political leaders, known as the Flammingants, who adopted for their motto the cry "In Vlaanderen Vlaams!" and raised the proud claim that the Franssprekenden as they nicknamed the Walloons and their sympathizers, must acknowledge that the Flemish element has all the rights that can be claimed by their French-speaking fellow-countrymen, including that of being addressed by the official representatives of the sovereign power in their own tongue. By using their native language the Flemings, who form three fifths of the population of Belgium, could oftener make their way to the front than by trying to rival their Walloon competitors in the speech that these have employed from the cradle. They would follow the example of the burghers of Ghent, who returned to Charles V his letter written in French. It was a question with them of abstract justice and of individual liberty, for it is the immemorial right of every community to have its laws inscribed and discussed in its own language and of every person to be heard in the tribunals of his own country without recourse to a foreign tongue. From a government of their own creation and Chambers that they controlled the Flemish politicians thought that they could exact the recognition of their national language, on which they had set their hearts, and which they supported by arguments drawn from the most varied sources, in the guise of historical precedent, the preponderance of the Flemish race, the abstract principles of justice, and the nationalistic tendency of the age. Not that they or their Walloon opponents recognized any separatist tendency in the movement, for all were careful to assert that the difference of language by no means constituted a difference of nationality and that Flemings and Walloons were all equally Belgian patriots. The Walloons protested that the bill would constitute a grave danger for Belgium by completely isolating the Flemish section of the inhabitants and placing the Walloons in a position of relative inferiority, both in the Chambers and elsewhere, by reason of their ignorance of Flemish. The Liberal Association petitioned Parliament to reject it on the ground that the actual laws gave entire satisfaction to the Flemish, while the Coremans law would oblige Deputies to vote articles that they did not understand and was only the first of a series of measures having for their object the exclusion of Walloons from public employments, revealing a tendency that constituted a danger to national unity. The opposition of the Walloons only served to fortify the Flemish politicians in their resolution to secure what they considered a just recognition of the equal standing of their community with that of the Walloons of the south. They carried the measure through the Chamber of Deputies by a large majority without any long discussion. The National Flemish Union denounced vengeance upon the Brussels Deputies who notoriously voted against it. There seemed little question of its passing the Senate in its integrity, especially after M. de Vriendt had declared that, should the Senate amend or modify it, he would withdraw it on its return to the Chamber rather than admit the least alteration in its stipulations. But before the vote was taken in the Senate the question began to be considered in quarters remote from the heat of political strife and the inconveniences and inexp-

diency of the change to be reflected upon. The bar of Ghent and Antwerp pronounced against it, for lawyers of both nationalities and political camps were agreed that the adoption of the two languages would needlessly complicate and encumber the forms of legal as well as parliamentary procedure in Belgium and that the translation of the French text into Flemish was fraught with many difficulties. The effects upon the standing and influence of the Belgian state and upon the opportunities of its citizens were the subject of misgivings. The act would accentuate the dual nationality of the Belgian people and tend to perpetuate race animosities among them. Every Walloon inhabitant would be compelled to learn to read and speak Flemish under penalty of being debarred from occupying any official post in his country, while the Flemings would not need, as heretofore, to become perfect masters of French. Yet a knowledge of Flemish serves no purpose outside of the little area where it is read and spoken. On the other hand, by maintaining the official position of French, the Government would render it incumbent on every aspiring Flemish youth to become proficient in a language that is not only spoken by every educated member of the community, but serves as a passport in most parts of the civilized world. Flemish as a language of affairs and legislation has yet to be created. Genuine Flemish, the literary form of the language, is not spoken in Belgium, where each village has its own rude and untranslatable dialect. The Walloons are entirely ignorant of Flemish except in the border district, where they can converse in the *patois* of their neighbors as well as in their own. North of this narrow district the Flemish dialects are uniformly heard, and south of it the Walloon dialects, but everywhere French is the common language of educated people, the language of polite intercourse, of literature and the press, of science, of law, and of commerce. All these considerations were brought out in the debate in the Senate, which was led to recognize that it was a proceeding fraught with serious and far-reaching consequences to confer a distinctly bilingual stamp upon the administration of the country. The only clause that finally passed the Senate, on Feb. 3, was one enacting that all acts of Parliament should henceforth be promulgated both in French and in Flemish. The friends of the bill would not accept this solution of the question. They withdrew the bill, determined to continue the agitation and press for the official and integral equality of the two national tongues in another year.

Legislation.—The Government on Jan. 1 accepted an arrangement presented by the French Minister regulating the relations of Belgium with France in Tunis. Parliament enacted a bill for suppressing gambling operations on the stock exchange. A plan of the works that will convert Brussels into a seaport was finally adopted by the ministry, the municipal authorities, and the commission of maritime installations on Jan. 4. The course of the canal will pass through the plain of Tour and Taxis, thus bringing the new docks nearly into the heart of the capital. The law authorizing the police authorities to expel foreigners, which was originally framed in 1835 and would expire on Feb. 15, 1897, was continued in force by a vote of 61 to 35 in the Chamber on Jan. 21. The English Government demanded redress for Ben Tillett, the labor organizer, who came to Antwerp in connection with the dock strike and was expelled by order of the Minister of Justice in 1896; but the Belgian Government cited precedents for its action. The British Foreign Office then proposed arbitration, and, Belgium acceding, a French jurist was se-

lected to arbitrate the matter. A congress of employees, composed of delegates representing clerks, salesmen, artisans, persons in Government employ, and the mass of wage earners who do not belong to the laboring class, met at Brussels on Feb. 7 with the object of taking common action with a view to bringing before Parliament the grievances of their class, and organized a system of local unions and a central league whose duty it should be to exact from parliamentary candidates a pledge to assist their cause. The Chamber, which heretofore has had no stricter code of discipline than the simple call to order, revised its rules against the protests of the whole Left for the avowed purpose of curbing the Socialists, who have introduced into the debates an unaccustomed laxity and disregard for parliamentary etiquette.

The Liberal Opposition supported the military authorities in the demand for army reorganization, which the Clerico-Conservative Cabinet took up and then abandoned or deferred because the ministers could not get their democratic followers to agree to submit to the enforced military service that it would entail. The Liberals insisted that the reform should embrace the reorganization of the Civic Guard. Societies of retired officers and military men of all grades, including veterans of 1880, representatives of the Liberal League, and delegations from communal councils and other corporate bodies, assembled in Brussels on June 13, and in a monster procession, with Gen. Brialmont for their spokesman, presented an address to the King in favor of army reform, to which King Leopold, who is a convinced advocate of the introduction of conscription into Belgium, replied with a powerful plea for the urgent necessity of strengthening the military defense of the country, saying that he was too solicitous for the security and eventual defense of the country not to desire that the principle of personal service should be the base of the military system, and that it would be at the mercy and hazard of events unless it organized its defenses solidly, modeling its military institutions on those of the surrounding nations, with tactical units composed, armed, and trained in conditions analogous to those of its neighbors. The King's outspoken utterances on the military question created a widespread sensation in Belgium and gave occasion for an interpellation in the Chamber. The bill for the reorganization of the Civic Guard was passed by the Chamber at the end of July after a long discussion. The Socialist Demblon protested against the clause providing for the administration of the oath of allegiance, and delivered a violent attack on the King, incurring thereby a vote of censure, passed by 74 votes to 17, with 6 abstentions. The Chamber passed a bill compelling all foreigners who have resided in Belgium for a year to enroll themselves in the Civic Guard. This measure was the result of the great increase of late in the foreign colonies of Brussels and Antwerp. Objections against the enforcement of this law were interposed by the British and American diplomatic representatives. The question of army reform took precedence of all other matters in the public mind. The original bill to enforce universal conscription and put an end to the privilege of purchasing substitutes enjoyed by the wealthy classes was withdrawn by the Government on the eve of the meeting of the Chambers in October, 1896, and in consequence Gen. Brassine resigned the Ministry of War. The actual strength of the Belgian army is the lowest of any country in Europe, and the military budget *per capita* is a third of that of France or Great Britain. Universal liability to service was exceedingly popular in the Walloon half of the kingdom. Even a section of the Socialists in their

parades carried banners praising the principle of a nation in arms. The Socialists in June set on foot a large miners' strike in the Bermejo district around Mons, the object of which was to obtain the recall of recently issued obnoxious pit regulations as well as an increase of 20 per cent. in wages.

Congresses.—Four congresses dealing with questions concerning the welfare of the laboring classes were held in Brussels during the summer of 1897. The first, meeting on July 7, discussed the question of Sunday rest, and took account of all the grounds—hygienic, social, and religious—upon which it is advisable to insure to working people a respite from labor on the first day of the week and the means by which the desired end can be legally enforced. M. Nyssens, the Minister of Industry and Labor, presided at this congress, the committees of which were made up of prominent representatives of the cause from the various Continental countries and from England. The second congress, held on July 23 and the two succeeding days, dealt with the question of the housing of workmen's families under improved conditions and at cheaper rents than now prevail. M. Beernaert, Minister of State and President of the Belgian Chamber, presided over this congress and over the next one, which opened on July 26 and remained five days in session, discussing the question of the employer's or the workman's liability in case of accidents, the compulsory insurance of workmen against illness as well as accident, and the just apportionment of the cost between the workmen and the masters. The legislation of European countries on this subject was studied with a view of working out a system of compulsory insurance for Belgium. The fourth congress, of which the Duc d'Ursel was chairman, discussed on Sept. 27 and the three following days the feasibility of organizing a system of international protective legislation for the benefit of workers in mines, factories, and other industrial establishments. Among the subjects of debate were hygienic regulations and the limiting of the hours of labor for men as well as for women and children. The chief countries of Europe and the United States were represented.

On Aug. 30 a congress, presided over by ex-Minister Lejeune, met to discuss the ways of combating drunkenness and its consequent evils. This was the sixth international congress against alcoholism, and it remained in session four days. The most important subject of debate was the mission of the state in controlling or suppressing the abuse of alcohol and the poverty and misery caused by alcoholism, the increase of disease, insanity, vice, pauperism, and crime, and other grounds for state interference.

The international conference to promote arbitration was opened on Aug. 7 in the hall of the Chamber of Deputies, and had M. Beernaert for its president. There were delegates present from America, England, France, Austria, Germany, Italy, Spain, Denmark, Sweden, Holland, and Roumania. The British section offered resolutions expressing regret that the United States had refused to ratify the Anglo-American arbitration treaty. There was a women's congress held in August; also in connection with the Brussels exhibition were convoked congresses of legal, bibliographical, and architects' medico-legal associations. An international colonial congress was organized under the auspices of King Leopold, with Auguste Beernaert for its president, and representatives arrived from France, Spain, Hungary, Brazil, Persia, Santo Domingo, Servia, and the Congo Free State.

BOLIVIA, a republic in South America. The legislative power is vested in the Congress, consisting of a Senate of 18 members, elected for six years, and a Chamber of Deputies of 64 members, elected

for four years. Every male Bolivian of full age and able to read and write possesses the franchise. The President is elected for four years by the vote of the nation, and is not re-eligible for the next succeeding term.

Severo Fernandez Alonso was elected as President on Aug. 13, 1896. The Cabinet at the beginning of 1897 was as follows: Minister of Foreign Affairs, Dr. Manuel M. Gomez; Minister of Finance, L. Gutierrez; Minister of the Interior and Justice, Macario Pinilla; Minister of Public Instruction, Colonization, Telegraphs, Public Works, and Industry, Dr. J. V. Ocha; Minister of War, G. Sanguines.

Area and Population.—The present area of Bolivia is computed to be 567,260 square miles. The population, according to an official enumeration made between 1880 and 1883, is 2,919,549, not including about 250,000 wild Indians. The civilized Indians number about 1,000,000, whites 5,000,000, and mestizos 500,000. La Paz, the former capital, has about 40,000 inhabitants; Sucre, the present capital, has 20,000. Education is free and legally compulsory. There were 506 primary schools in 1894, with 710 teachers and 26,873 pupils.

Finances.—The revenue for the financial year 1896 was estimated at 6,305,736 bolivianos, and the expenditures at 6,727,824 bolivianos. The public debt amounts to 9,493,705 bolivianos, consisting of 4,428,705 bolivianos of internal debt, various loans amounting to 3,065,000 bolivianos, and an external debt of 2,000,000 bolivianos. The expenditure on the army in 1896 was 1,781,624 bolivianos. The standing army numbers 1,250 men, besides which there is a National Guard, forming the reserve and the extraordinary reserve, in which, under the conscription law of 1892, all citizens are required to serve from the age of twenty-one to that of forty.

Commerce and Production.—Metals and forest products constitute the exports of Bolivia, besides some coffee, which is exported to Chili and the Argentine Republic, and hides and skins. Since the loss of Antofagasta to Chili Bolivia has had no seaport. The export of rubber is large and increasing. Coca is an important product, and so is cinchona, but less so than formerly. Sugar is grown for the distillation of rum. Wheat, corn, barley, and beans are raised for domestic consumption. Cattle, sheep, and llamas are numerous. These last are the common transport animals. Wool is made into coarse cloth worn by the Indians. The silver produced in 1894 was 14,519,296 ounces. Tin is found associated with silver, and in 1895 the export amounted to 2,000 tons of bars and about 4,000 tons of concentrated tin ore. The annual product of copper barilla is 3,000 tons. Gold is washed out by the Indians in small quantities. Other mineral products are antimony, bismuth, salt, and borax. The imports for 1894 were estimated at 6,800,000 bolivianos, consisting chiefly of provisions, hardware, textiles, wine and spirits, and apparel. The exports of silver and silver ore through Antofagasta are estimated at £1,914,500, and the tin exports at £433,000. Considerable silver is coined in the mint, but there has always been an export movement taking the coin out of the country, hence the Government now coins only half bolivianos and smaller pieces 8 per cent. lighter than the old bolivianos.

Communications.—There are 500 miles of railroad, forming the Bolivian section of the line leading from Antofagasta to Oruro, with a branch to Huanchaca. Concessions have been granted for lines from Oruro to Cochabamba and from Chichipata to Potosi, for one from La Paz to the Peruvian frontier, connecting with the road from Mol-

berth to Lake Titicaca, and for one in the east from Santa Cruz to the Paraguay river. An international railroad between Bolivia and the Argentine Republic is projected.

The telegraph lines have a total length of 2,000 miles. The post office forwarded 1,532,458 letters, newspapers, etc., in the internal, and 420,579 in the international service in 1893.

BOOK-PLATES. To Germany we undoubtedly owe the origination of the earliest example of a book-plate with which to mark ownership of a printed book that came from German types, and to which it is an unstrained sequence. The earliest book-plate known has been assigned a probable date of about 1450. As might be expected, this was exceedingly crude when compared with more recently engraved plates by the best artists. The early plates were very simple in design, being, in fact, only what are now known as "name labels." These early labels were rectangular slips on which appeared the owners' names, often bordered elab-

later the late Hon. J. Leicester Warren (Lord de Tabley) published his "Guide to the Study of Book-

orately. Because of the limited education of the masses for a considerable time after the advent of printing, it was found that something more than a printed name was needed, and a substitute was sought and found in heraldry, since a knowledge of arms and coats of arms was then practically universal. A wider field was at once opened to the designer and the artist, which they quickly improved, and because of this fact and the present decadence of a knowledge of heraldry the book-plate collector of to-day is confronted with a considerable task by way of plate identification in the pursuit of his hobby. No one finds the mastery of book-plates to be an elementary or an easy matter, as might at first appear. To become an authority or an expert requires the labor of many years in many departments of research.

Notwithstanding the comparative antiquity of book-plates, little attention was paid to them until a very recent period. It is true they were used here and there, and people knew there were such things, but almost no literature appears on the subject until in 1837 Rev. Daniel Parsons wrote some magazine articles on book-plates. More than forty years

plates," following M. Poulet Malassis on French plates, whose monograph appeared in 1874, classifying, arranging, and originating a nomenclature that has since served as a standard. The rules described by Warren, on which the composition of book-plates had for the most part taken place, have been subject to frequent modification and change.

ENGLISH TRICKED PLATE. PERIOD PRIOR TO 1738.

In the fifteenth century it was the name label followed by the varying armorial and heraldic types, exemplified among others by the famous Albrecht

Dürer, that continued in use until the sixteenth century, when they gave way to the Jacobean, the popularity of which continued until 1745, or perhaps somewhat later. The book-plate work of William Hogarth was Jacobean.

The Chippendale plate originated before the passing away of the Jacobean style, and continued subsequent to it. This style was characterized by the

EARLY AMERICAN NAME LABEL. DATE 1810 TO 1819.

graceful curves and lines of the furniture that was then in vogue, from which it derived its name.

The Ribbon-and-Wreath, or, as sometimes designated, the Festoon, style followed, and this became very popular for ladies' plates.

The Celestial, the Allegorie, the Portrait, the Bookpile, the Library Interior, and the View book-plates succeeded, in the order indicated, and as the caprice of the period and the artist and designer dictated.

Thomas Bewick did his best book-plate work, so much in favor now among collectors, in the View or Landscape style.

There is now apparently no prevailing school or style, all are fash that come to the modern designer's net; but if there be a tendency to-day it is toward what is called the Pictorial, which more than any other class affords opportunity to show, so far as such things can, the taste, the culture, and the ideals of the plate owner. They afford pleasing opportunities for the introduction of charming little bits of *genre*, artistic sketches, and a thousand tasteful creations that linger long in pleasant memory.

It was once customary to place upon a book-plate warning verses against various sins of omission or commission, selected examples of which are here introduced:

Fear not nor soil not,
Read all, but spoil not.

My friend, should you this book peruse,
Please to protect it from abuse:
Nor soil, nor stain, nor mark its page,
Nor give it premature old age;
And when it has effected all,
Please to return it ere I call.

If any one should borrow me,
Pray keep me clean;
For I am not like linen cloth,
That can be washed again.

Not until 1820 did book-plates begin to be collected and seriously studied, and it was a Miss Jenkins, of Bath, who inaugurated this amusement.

The book-plate collector has since been frequently subjected to no little abuse by writers who have scorned his harmless pastime, and who ignore the fact that the records on book-plates that are preserved by the indefatigable collector are sometimes of great utility, not alone to the historian and the genealogist, but also to the lawyer. They have compared him with Dr. Dribdin's Grangerite, who destroys ruthlessly many books for the sake of the extra illustration of other books (originally Granger's History of England, whence the derivative) with the engravings thus procured, and have even spoken of all collectors as ghosts, not knowing whereof they write.

Ladies' book-plates, as a separate class, first appeared in Germany about 1588. In England the earliest known is that of Elizabeth Pindar, dated 1606. Hannah Adams had the earliest known American plate.

The department of French book-plates is very interesting, as it records many political changes that have taken place, the influence of which has been reflected even in the examples of *ex libris* that have come down to us, which find no parallel in any other country. The illustration of a French plate of the middle of the seventeenth century shows a unique peculiarity wherein the arms rest upon a mosaic pavement, wherein the charges on the shield are reproduced on alternate squares thereon.

Prior to 1738 it was customary in England to "trick" the arms by indicating the color, as shown, instead of by arbitrary dots and lines in the conventional forms that subsequently came into use, which system now prevails.

England, Germany, France, and the United States all support *ex libris* societies, which encourage an interest in this subject. American collectors are turning more and more toward gathering plates of their own country, especially early American examples, and there is an especial interest for an American in such plates as those of George Washington, William Penn, Joseph Dudley, Daniel Webster, Oli-

AMERICAN ARMORIAL PLATE OF CHARLES HOPWELL, ESQ. N. Y. HAS BEEN USED IN HIS FAMILY FOR TWO CENTURIES.

ver Wendell Holmes, George Bancroft, and others, with historical and other associations. The list of known collectors of book-plates in this country is not extensive. Probably 100 would far exceed the total number of those who have more than 3,000 specimens. This is easy to understand, because it is a subject that does not appeal to many. Among

the last-known early engravers of book-plates in America was Nathaniel Hurd, whose style was principally Chippendale, and who engraved a plate for Harvard College which is still in use there. Alexander Anderson, who was the first American wood engraver, produced, so far as known, seven plates on wood and three on copper, included among which are plates for the old Apprentices' Library and Columbia College, which are executed in the Allegorical style. Henry Dawkins worked entirely in the Chippendale style. The style of Amos Doolittle favored the Allegorical. He is remembered by some excellent work of this kind, which includes two plates for the Societies of Yale College. Peter Rushton Maverick favored the Ribbon-and-Wreath style. He engraved a plate for De Witt Clinton, and two for the New York Society Library. Paul Revere was of the company of these early engravers of book-plates, his own and that of Epes Sargent being, perhaps, the best known of his work in this direction. One of the earliest collectors in the United States was the late James Eddy Mauran, of Newport, R. I., whose collection, when he died, in 1888, numbered about 3,500 plates. Among other collectors and authorities in this field in our country may be mentioned Richard C. Lichtenstein, of Boston, who has published several monographs on the subject; Fred J. Libbie, of Boston; H. E. Deats, of Flemington, N. J.; Dr. Henry C. Eno, of Saugatuck, Conn.; Mrs. Richard J. Barker, Warren, R. I.; Miss Helen E. Brainerd, of Columbia College; Henry Blackwell, of New York; Dr. Charles E. Clark, of Lynn, Mass.; Nathaniel Paine, of Worcester, Mass.; Dr. Joseph H. Dubbs, of Lancaster, Pa.; Dr. George L. Parmelee, of Hartford, Conn.; James Terry, of New Haven, Conn.; H. W. Bryant, of Portland, Me.; George F. Allison, of Brooklyn, N. Y.; and Laurence Hutton, of New York. The literature on this subject is not extensive, and has been limited mainly to newspaper and magazine articles. Charles Dexter Allen published in 1894 "American Book-plates," and in 1896 "Ex-Libris, Essays of a Col-

"Book-plates," by W. J. Hardy; and "Ladies' Book-plates," by Norma Labouchere. Henri Bouchot has treated of French plates, Herr F. Warnecke of Ger-

RECENT AMERICAN PICTORIAL PLATE.

RECENT AMERICAN PICTORIAL PLATE.

man plates, M. C. M. Carlander of Swedish plates, Robert Day in Ireland and J. Orr in Scotland are workers in the same field. Much remains to be done with this subject. The Italian plates are without remarkable excellence or defect, being often flat and insipid. The Spanish are frequently harsh, but bold and gloomy. The Swiss are stiff and generally ill arranged, and the Russian, so far as they are known to exist, have been borrowed from the French of the Louis XV period.

BRAZIL, a federal republic in South America. The legislative power is vested in the National Congress, consisting of a Senate of 63 members, 3 from each State and the Federal District, and a House of Deputies containing 212 members, elected by the voters of the States in proportion to their population, 1 member to 70,000 inhabitants. Senators serve nine years, one third retiring every three years; Deputies are elected for three years. The State of Amazonas elects 4 Deputies; Pará, 7; Maranhão, 7; Piahy, 4; Ceará, 10; Rio Grande do Norte, 4; Parahyba, 4; Pernambuco, 17; Alagoas, 6; Sergipe, 4; Bahia, 22; Espírito Santo, 4; Rio de Janeiro, 17; São Paulo, 22; Paraná, 4; Santa Catarina, 4; Rio Grande do Sul, 16; Minas Geraes, 37; Govaz, 4; Matto Grosso, 4; the Federal District, 10. Every Brazilian male citizen twenty-one years of age and able to read and write possesses the electoral franchise with the exception of soldiers actually serving in the army, members of monastic orders, and paupers. The President, who appoints the ministers and, with the consent of Congress, the judges of the Supreme Federal Tribunal and the diplomatic representatives, and has the supreme command of the military and naval forces, is elected by direct vote of the people for four years. The National Congress legislates on import duties, stamps, postal arrangements, and bank-note circulation. The States have the right to impose export duties, and each one is administered at its own expense without the interference of the

lector." In England, beyond privately printed volumes and those previously mentioned, there have been published "English Book-plates," by M. A. Castle; "French Book-plates," by Walter Hamilton;

Federal Government save for defense, the maintenance of public order, and the execution of Federal laws.

The President of the republic, Prudente de Moraes Barros, elected for the term ending on Nov. 15, 1898, retired in November, 1896, and the Vice-President, Manoel Victorino Pereira, then became acting President. The Cabinet in the beginning of 1897 was as follows: Secretary of Foreign Affairs, Gen. Dionysio E. de Castro Cerqueira; Secretary of Finance, Dr. F. de P. Rodrigues Alves; Secretary of War, Gen. Bernardo Vasques; Secretary of Industry, Communications, and Public Works, Dr. A. Olyntho dos Santos Pires; Secretary of the Interior and Justice, Dr. A. de Seixas Martins Torres; Minister of Marine, Admiral Elnisario J. Barbosa.

Area and Population.—The area of Brazil is estimated at 3,209,878 square miles. The population at the census of Dec. 31, 1890, was 16,330,216. The white population, residing in the seaport towns, numbered 3,787,289 in 1872, while the population of mixed blood numbered 3,891,787, the negroes, who predominate in Rio de Janeiro, Bahia, Pernambuco, and Minas Geraes, numbered 1,954,452, and there were 386,955 Indians, who form the largest element in the population of the northern States. The immigration in 1890 was 107,100; in 1891, 218,958; in 1892, 86,513; in 1893, 84,143; in 1894, 63,294. In 1895 there arrived 164,598 immigrants at Rio de Janeiro and Santos. Among the immigrants in 1894 were 37,266 Italians, 17,251 Portuguese, 6,497 Spaniards, 812 Germans, 754 Austro-Hungarians, 310 French, and 91 British. In Rio Grande do Sul, where there are important German and Italian settlements, 15 foreign colonies, numbering 108,000 persons, occupy 562,400 hectares of land, of which 220,050 hectares are cultivated. The higher education is under the control of the Federal Government, while the States are required by the Constitution to provide free, secular primary education. In none of the States is education compulsory. At the last census 84 per cent. of the population was returned as illiterate.

Finances.—The provisional returns give the Federal revenue for 1894 as 266,484,615 milreis (1 milreis = 54.6 cents), and the expenditure as 370,668,341 milreis. The budget estimate of revenue for 1895 was 300,725,297 milreis, and of expenditure 275,691,670 milreis; the estimate of revenue for 1896 was 331,174,400 milreis, and of expenditure 343,436,210 milreis. In the provisional estimates for 1897 the revenue is taken to be 335,894,000 milreis, of which 258,000,000 milreis are derived from customs, 1,700,000 milreis from various dues, 35,500,000 milreis from railroads, 7,100,000 milreis from posts and telegraphs, 8,300,000 milreis from stamps, 1,200,000 milreis from the waterworks of Rio de Janeiro, 1,500,000 milreis from lottery taxes, 6,939,000 milreis from miscellaneous sources, 1,700,000 milreis from tobacco duties, 150,000 milreis from export duties, and 13,805,000 milreis from extraordinary resources. The total of expenditure is estimated at 329,112,753 milreis, of which 16,258,872 milreis are for the Department of the Interior and Justice, 2,034,012 milreis for Foreign Affairs, 28,439,706 milreis for Marine, 54,767,584 milreis for War, 98,953,334 milreis for Industry, and 128,659,245 milreis for Finance.

The debt of the Federal Government on Dec. 31, 1895, amounted to 1,888,475,666 milreis, consisting of an external debt of £36,098,800, an internal funded debt of 362,488,635 milreis in paper, a gold loan of 275,473,500 milreis, 678,073,922 milreis of paper currency, a floating debt of 244,628,677 milreis, and 6,893,500 milreis of guaranteed railroad debts. Converted into paper values at current rates the debt amounted to 2,713,952,000

milreis. On the foreign debts 4 and 4½ per cent. interest is paid on the internal funded debt from 4 to 6 per cent. The States had in 1895 funded debts amounting to 85,077,969 milreis and 66,79,977 milreis of floating liabilities.

The Army.—Compulsory military service was introduced in Brazil in 1875. The term of service is three years in the active army and three years in the reserve. The army is organized in 40 battalions of infantry, with 1 transport and 1 depot company; 16 cavalry regiments of 4 squadrons each; 2 cavalry corps of 4 companies, 5 garrison companies, and 1 garrison squadron; 5 regiments of field artillery and 9 battalions of fortress artillery; and 2 battalions of engineers. The strength of the army in 1895 was 4,000 officers and 24,120 men.

The Navy.—The Brazilian navy contains some powerful vessels of modern type. The cruiser "Almirante Tamandare," of 4,465 tons, built in Brazil in 1890, has engines of 7,500 horse power and a formidable armament of rapid-firing guns. The "24 de Maio," of 4,950 tons, is the reconstructed "Aquidaban," which was sunk by a torpedo during the naval revolt of 1893-'94 and afterward refloated. This ship and the "Riachuelo," of 5,700 tons, are English-built battle ships, armed with 21-inch breech-loading guns mounted in turrets, and protected by a belt of 11-inch steel-faced armor. The "Nichteroy," formerly called "El Cid," is a first-class cruiser. The "Benjamin Constant," of 2,750 tons, and "Barrozo," of 3,800 tons, are efficient second-class cruisers. There are 9 third-class cruisers and 6 port-defense armor clads and river monitors. The torpedo flotilla consists of 8 first-class and 6 smaller torpedo boats. The torpedo cruiser "Aurora," of 480 tons, built in England in 1893, has a speed of 18 knots. A new programme of construction has been adopted, including 3 second-class and 3 third-class cruisers, 2 ironclads of 3,162 tons for port defense, 8 destroyers, 6 first-class torpedo boats, and 2 Goubet submarine boats.

Commerce and Production.—Brazil is the largest producer of coffee of all countries. The annual yield is about 8,000,000 bags of 60 kilogrammes. The crop of 1897 in the State of Rio de Janeiro alone was estimated at 3,750,000 bags. The crop of Santos in 1895 was 4,010,249 bags. In Pernambuco sugar is raised extensively; the crop of 1894 was 185,000,000 kilogrammes. The production of alcohol is large and increasing. Rubber is a valuable forest product of Pará and the Amazon region. The forests of Brazil are of enormous extent and contain many products of value, but they are not available on account of the lack of communications. The mineral resources of the country are great, but lack of fuel, of transport facilities, and of skilled labor stand in the way of their utilization. Enormous iron deposits lie unworked. English and French companies operate gold mines in Minas Geraes. There is also some mining in Bahia, where, besides gold, silver, lead, zinc, iron, manganese, copper, and quicksilver have been found. Diamond mines are worked, though they are not so productive as formerly. In Rio Grande do Sul, where the climate is temperate and a large European population has settled, cattle raising is the leading industry. The number slaughtered in 1895 was 280,000. There are successful tanning establishments and breweries in this State, and the preserving of fruit for export is a growing industry. Cotton is raised in various parts of Brazil, and under a protective tariff progress is made in its manufacture.

The total value of imports in 1895 was estimated at \$150,000,000. The import duties are very high on spirits, tobacco, matches, tea, and provisions, and other articles of consumption, ranging from 80 to

120 per cent. *ad valorem*. On agricultural machinery and tools and implements of industry light duties are charged. The chief imports are cotton and woollen cloths, iron, machinery, coal, flour, cattle, jerked beef, rice, codfish, pork, lard, butter, corn, olive oil, macaroni, tea, candles, petroleum, salt, timber, wine, and spirits. The total value of exports for 1895 was computed to be about \$180,000,000. The exports of coffee from Rio de Janeiro in 1895 were 2,761,720 bags; from Santos, 3,574,484 bags; from Victoria, 307,438 bags; from Bahia, 264,775 bags; from Ceará, 20,202 bags. The export of cacao from Belem in 1894 was 4,963 tons. Of sugar 58,014 tons were exported in 1895 from Pernambuco, 36,000 from Maceio, and 4,360 tons from Rio Grande do Norte. Maranhão exported 1,521 tons of cotton; Pernambuco, 5,900 tons; Rio Grande do Norte, 21,568 bales. The export of rubber from Pará in 1895 was 20,600 tons; from Manaus in 1894, 4,370 tons. Rio Grande do Sul in 1894 exported 20,831,226 kilogrammes of dried beef, 3,552,375 kilogrammes of tallow, and 496,011 raw-hides.

Navigation.—During 1895 there were 1,460 vessels, of 2,243,163 tons, entered at the port of Rio de Janeiro; 1,015, of 1,325,777 tons, at Bahia; 1,002, of 1,175,572 tons, at Pernambuco; 188, of 184,809 tons, at Ceará; and 148, of 181,852 tons, at Maranhão. Rio Grande do Sul was visited by 331 vessels, of 109,993 tons, in 1894.

The mercantile fleet of Brazil in 1895 comprised 285 sailing vessels, of 65,575 tons, and 189 steamers, of 75,283 tons. Under the law that went into force in November, 1894, foreign vessels are excluded from the coasting trade and river navigation, and companies that engage in such traffic under the Brazilian flag receive subventions from the General Government which amount to 2,809,640 milreis a year.

Communications.—There were 8,086 miles of railroads in operation in 1896, and 5,403 miles were under construction, 4,670 miles under survey, and 8,440 miles more projected. The Federal Government owned 1,832 miles of the completed lines and subsidized 2,259 miles more; 3,000 lines were managed by the State governments or operated under concessions received from them, and 995 miles were roads that received no subventions. Of the roads under construction 385 miles were being built without subventions, 961 miles were being constructed for the State governments, 667 miles were being built for the Federal Government, and 3,390 miles companies were building with concessions and guarantees from the Government. The majority of the companies owning the railroads have a guarantee of 6 or 7 per cent. interest on their capital from the Federal Government. The deficit paid from the national treasury up to the end of 1894 was 11,118,481 milreis. The capital invested in the national railroads was 257,674,937 milreis, and their receipts up to the end of 1894 had fallen short of the expenses and interest by 11,118,477 milreis.

The post office forwarded 33,441,000 letters and postal cards in 1895, and 37,674,000 samples, circulars, etc. The telegraphs are owned by the Government. There were 10,143 miles of line in 1895, with 21,936 miles of wire. The number of dispatches sent was 1,283,695; receipts for 1897 were estimated at 3,600,000 milreis, and expenses at 9,844,722 milreis.

Financial and Political Crisis.—Commercial depression, consequent upon the great fall in the value of coffee, the continuous depreciation of the currency, and the financial embarrassments of the Government produced a widespread feeling of political uncertainty and unrest. The people became dissatisfied with the way in which they were governed,

and yet were as strongly attached as ever to republican institutions and the more mistrustful of the Conservative element, formerly identified with the empire, because the very misfortunes of the republic seemed to suggest the advantages of monarchy. The men of tried experience, who gave tone to political life before the revolution, have been debarred from any participation in public affairs; many of them are in exile. A strong and turbulent factor in the political situation has been the semimilitary element that has sprung up as a result of the disturbed condition of affairs in the last eight years. This party is composed of ardent and jealous republicans, who imagine they see at every turn an attempt to restore the monarchy. On slight provocations, or with none at all, such men have organized riots in the streets of Rio de Janeiro and other cities and attacked their political opponents, even going to the length of killing prominent citizens suspected of monarchist sympathies. In 1896 and the early part of 1897 violent and irrational outbreaks of this character occurred repeatedly. The authorities took no precautions to prevent such disturbances, and in consequence these extreme republicans, most of whom are young men, have exercised a species of terrorism over peaceful citizens of Conservative tendencies.

The enormous debt that has accumulated under the republic is, with the diminishing revenue, an excessive burden. Out of a total income of little more than \$50,000,000 in gold value the National Government has to pay \$30,000,000 to meet the annual debt charges. Except the customhouse scarcely any source of revenue is available. The ordinary expenses of the administration swallow up the rest, leaving unforeseen and extraordinary requirements, such as the cost of suppressing insurrection or the purchase of war ships and munitions, to be added to the debt. The expenditure has invariably exceeded the revenue for many years past, and the usual method of meeting the deficit has been by fresh issues of inconvertible bank notes. To this the chief part of the financial difficulty of the Brazilian Government must be attributed. The true condition of the treasury is not publicly known, nor is the exact amount of these paper issues in circulation, but there were computed to be in the spring of 1897 not less than 700,000 contos of reis, equal to nearly \$400,000,000 in face value, and \$125,000,000 at the depreciated rate of exchange. Commerce has been depressed not only by the low prices obtained for coffee and the falling rates of exchange, but by the constant changes made in the tariff to which the Government was forced to resort in order to protect itself from the results of the constant depreciation of the currency, for the tariff duties are payable in paper, not in gold. To tide over its difficulties, which were increased by the expeditions sent against the fanatics of Bahia, the Government proposed to sell the lease of the State railroads, expecting to get at least \$25,000,000 in gold. Negotiations were opened with syndicates in England and Germany.

The depression in the coffee market affected not the finances of the Government alone, but the condition of the whole population of Brazil. Nearly all the energies of the country have been devoted to coffee cultivation, while cereals and other necessities of life have been imported from abroad. In former times the southern provinces of Parana, Santa Catarina, and Rio Grande do Sul produced wheat and beef for the supply of Rio de Janeiro and other northern markets, but the revolutions and disturbances of the last few years have caused these industries to be almost abandoned. Since the currency has depreciated, and coffee prices have fallen at the same time, the difficulty of obtaining

food supplies from abroad has been doubled. There was no enterprise shown in pushing manufacturing interests when coffee gave good returns, and all the available labor supply of the country was wanted for coffee cultivation, and this concentration of capital in a single industry makes the conditions of life in Brazil exceedingly hard since that industry has ceased to be profitable. The overproduction of coffee is the result of planting immense additional areas and the opening of railroads not only in Brazil, but in Mexico, Central America, and other countries. The Brazilian crop for 1897 was nearly 9,000,000 sacks, but its value was much less than when the export was less than half as large. The world's consumption is about 11,000,000 sacks, while the total production of all countries in 1897 was 13,000,000 sacks. As Brazil is the chief producer of coffee it has been the principal sufferer through the fall in prices. The estimated value of Brazilian exports for 1897 is \$80,000,000 for coffee, \$30,000,000 for rubber, and \$12,500,000 for other products; a total of \$122,500,000, which is \$42,500,000 less than the value for 1895, a decline of over 25 per cent. in two years. The value of rubber is constantly increasing, but the quantities available make up but a small part of the loss through coffee.

Dr. Prudente de Moraes, who retired from the presidency in November, 1896, on the plea of ill health, resumed his functions on March 4, 1897. He issued, on the demand of the ministers, a public statement that he would follow the policy initiated by Vice-President Victorino Pereira. In June demonstrations in São Paulo against President Moraes called for the interposition of the military as well as the police. In May the Government was forced by the crisis to increase the customs duties 10 per cent, and to levy a heavier tax on the postal and telegraph services. Economies to the extent of \$7,000,000 were introduced in the Government expenses. The financial committee of the Chamber of Deputies in August reported that it would be necessary to suspend the payment of interest and amortization of the bonds, but the Government found means of raising funds to pay the most pressing obligations. The liabilities to be met during the year amounted to £7,174,300 sterling, consisting of £1,956,700 interest on the external debt, £1,156,700 on the internal gold debt, £1,284,300 of railroad guarantees, £776,600 on the internal currency loans, £1,000,000 of advances from the Bank of Paris to be repaid in 1897, £500,000 for war ships and armament contracted for, and £500,000 to pay for the Canudos expedition. The estimated expenditure for administrative purposes was 270,000,000 milreis, equal to £9,000,000, making the total expenditure over £15,000,000, while the revenue was estimated by the Budget Committee at 316,000,000 milreis, or about £10,500,000. The actual receipts were much below the estimate.

Foreign Affairs.—In February, 1897, a convention was signed between France and Brazil for the purpose of arbitrating the boundary of French Guiana in the basin of the Cunani river, a dispute of old standing, which reached an acute phase after gold was discovered along the upper Cunani. This convention President Prudente Moraes upheld vigorously, despite strong opposition among the people, which encouraged Congress to refuse its ratification. The Brazilian Government stipulated that the Amapa question should be dealt with and settled before proceeding with negotiations relative to other points in the Guiana boundary dispute. The Italian Government made heavy additional claims for wrongs committed upon Italian subjects during the revolution that occurred in the presidency of Gen. Peixoto. A new extradition treaty was concluded with the United States in May.

The Fanatics of Canudos.—For more than twenty years a religious enthusiast, Antonio, called Conselheiro (counselor), has gone about preaching the necessity of absolute and unbounded faith among the emotional and naturally religious people of mixed Indian, negro, and Portuguese blood inhabiting the interior districts of Bahia, Pernambuco, and the country farther to the north. He built chapels in many places, and was everywhere followed by a horde of devoted adherents drawn from the ignorant and superstitious country people, to whom he promised future happiness if they should be killed in defending his cause. The followers of Conselheiro were in great part armed, it being the custom of the country to carry arms. From their temporary encampments they committed many depredations and levied contributions on the inhabitants, as they had no other way of obtaining food. Their thefts of cattle and other things became a serious nuisance when their numbers increased to several thousands. The movement became a menace, moreover, to the state, for the constant burden of Conselheiro's harangues was that the present Government of Brazil was atheistic, and hence undeserving of obedience and doomed to be overthrown. In November, 1896, the fanatic, as the Brazilians called Conselheiro, established his headquarters in Canudos, a town in the Monte Santo district of the State of Bahia. The police charged on the bands when they first invaded the place, the leader having refused to depart, and were routed, some being killed. Reinforcements of police were sent by the Governor from Bahia, and these too were driven back and a large number killed or wounded by a troop of women, who fell upon them in flight and slashed them with the *faca*, a terrible cutting weapon. After this second affair Conselheiro went into the neighboring *sierra* with his followers and took up a position in a natural fort. The movement having taken on the character of a rebellion, people in the rural towns and plantations who were hostile to the Government helped the fanatics with arms and money. Others, who would not give willingly, were subjected to the vengeance of Conselheiro's bands. A battalion of Federal troops was dispatched from Rio Janeiro under the command of Col. Moreira Cesar and Major Francisco M. Brito. While the troops lay encamped in the valley of Monte Santo, firing with their Mauser rifles at any of Conselheiro's men who showed themselves in the mountains, they were attacked by the fanatic Amazons. The onset was so sudden and furious that the soldiers dropped their arms and fled in panic, pursued by the women, who slaughtered the wounded. This victory of the rebels attracted fresh recruits. Men of military training improved their organization. In February Conselheiro had 8,000 well-armed men in Bahia. The Federal troops were defeated on March 3 when attempting to move upon the positions held by the rebels, fighting through a whole day with five times their numbers, and finally retreating with a loss of 600, leaving guns and ammunition in the hands of the insurgents. Many plantations and two small towns were burned by the fanatics. Having obtained steam launches, they patrolled the rivers in the districts where they were strong, and thus extended their depredations. Large quantities of arms, ammunition, and provisions poured in from mysterious sources. The growing strength of the rebellion and manifestations of sympathy in other parts of the republic gave rise to the belief that Conselheiro, who raised the imperial flag, was the forerunner of a general monarchist rebellion, and that the Comte d'Eu, the son-in-law of Dom Pedro II, was at the head of the movement. In Rio Janeiro, São Paulo, and other

cities monarchists were mobbed, and the offices of Conservative newspapers were wrecked. In March Conselheiro's bands appeared in Sergipe, Piahy, Pernambuco, and Minas Geraes. Saraiva, a lieutenant of Conselheiro, attempted to start an insurrection in Rio Janeiro province. Conselheiro himself had 10,000 or 12,000, and Plato Diniz about 1,500 in the northern provinces. The Government proposed to double the strength of the army, and there were threatening demonstrations in Rio against President Moraes, who expressed a willingness to resign. After the last engagement, in which Col. Moreira Cesar was killed, a fresh Government force of 7,000 men was sent up to Canudos from Rio and Pernambuco. Gen. Cantuzia was dispatched to Bahia with a large force of artillery. These forces, commanded by Gen. Arthur Oscar, attempted no rash movements, but advanced slowly against Canudos, where the fanatics were regularly intrenched. Their progress was impeded at every point of the 250 miles from Bahia. Well-guarded outworks stopped them, and fanatic bands of men and women rushed upon them from hiding-places. The arduous march took two months. Early in June the Brazilian troops, under Gen. Oscar, defeated 8,000 fanatics, killing 300. Before the end of the month they had driven them within their fortifications, and were victorious in several skirmishes. On June 27 and the following days a series of assaults on the town were repelled, with the loss of more than 1,000 of the Federal troops and higher losses on Conselheiro's side. The Government troops were re-enforced until they outnumbered the town's defenders three to one. The bombardment was kept up day after day, and in a final assault on July 7 the town was captured after a fierce battle lasting four hours. The troops destroyed churches and other buildings in which the fanatics took refuge. Conselheiro's forces concentrated in five villages in the Canudos district, which Gen. Arthur Oscar proceeded to invest. Further re-enforcements of 4,000 men were forwarded. On July 23 the Brazilian troops occupied two of the villages. Before the main position was attacked the Government army consisted of 15,000 men. Fighting occurred constantly, and the fanatics frequently held the road between Monte Santo and the front, and interrupted the transport of ammunition and stores. In the mean time fresh bodies of fanatics appeared in the States of São Paulo and Paraná. The force in the Canudos district was still 8,000 strong, and was well intrenched. In the petty engagements that took place during August 2,400 Brazilians were wounded in the hand-to-hand conflicts. In the beginning of October Conselheiro's position was at last captured after continuous fighting for several days. Admiral Barboza directed the final operations, during which Conselheiro was slain with thousands of his followers. The fanatic leader was a man of powerful build and stern and commanding presence, who possessed unusual military talents as well as a gift of magnetic oratory. He was very good and humane to his mixed troops, who obeyed him like children. Many soldiers deserted from the Brazilian army to Conselheiro. While the victorious battalions were undergoing review on their return to Rio Janeiro a soldier made an attempt on the life of President Moraes, killing Col. Moraes, who intercepted the dagger. Immediately afterward a shot struck Gen. Machado Bethencourt, the Minister of War. The capital was declared under martial law.

BRITISH COLUMBIA. This portion of the Dominion of Canada has come prominently before the public of other countries during the past year on account of the mineral discoveries and mining development. It extends about 700 miles north

from the international boundary line, and nearly 500 miles east and west. Its area is 383,000 square miles, which includes part of the ranges of the Rocky mountains and the Selkirks, the Queen Charlotte Islands, Vancouver island, and a great variety of forests, valleys, mountains, lakes, and water ways. The chief harbors are Esquimaux—the headquarters of the British Pacific squadron—Victoria and Nanaimo, on Vancouver island. Coal Harbor and English Bay, in connection with Burrard Inlet, are the ports on the mainland. The dry dock at Esquimaux is 450 feet long, with a width of 90 feet, while the fortifications, which are partly built at British and partly at Canadian cost, are considerable.

Political.—There were no political changes during the year 1896-'97, excepting the share which the province took in the Dominion elections. Lieutenant Governor the Hon. Edgar Dewdney retired at the end of his term, in November, 1897, and was succeeded by Senator McInnes. William Templeman, a local newspaper editor, was called to the Dominion Senate in place of the latter. The Executive Council at the end of 1897 included J. H. Turner as Premier, Minister of Finance and Agriculture; Hon. Charles E. Pooley as President of the Council; D. M. Eberts as Attorney-General; James Baker as Provincial Secretary and Minister of Mines and Immigration; G. B. Martin as Commissioner of Lands and Works.

The Legislature met on Feb. 8 and adjourned on May 8. The budget speech showed an estimated revenue for 1897 of \$1,283,000, and expenditure of \$1,566,000. During 1896 the receipts were \$989,765, and the expenditure \$1,614,723. The Government's railway policy was the lending of \$25,000 to various small development lines at the rate of \$4,000 a mile. The question of retaliation against the United States was discussed and a parliamentary committee reported in favor of a law for prohibiting aliens from mining in the province. But the central topic of discussion in the province was the Dominion policy of subsidizing the Canadian Pacific Railway to build a branch line through the Crow's Nest region into the heart of the mining districts. The province wanted an independent and competing line, but the continental road won the battle. The following were the terms accepted by the Canadian Pacific Railway in return for a Dominion grant of \$11,000 a mile for 330 miles of road from Lethbridge through the mountains to Nelson:

1. Running powers over the Crow's Nest Railway are conceded to other railways at a rental to be fixed by the Dominion Government.
2. The freight rates are to be under the control of the railway committees of the Privy Council.
3. Freights from points on the Crow's Nest Railway to points on any other part of the Canadian Pacific system, and *vice versa*, are to be under control of the Railway Committee, or of any railway commission to be hereafter appointed.
4. Rates on certain classes of freights on the eastern portion of the Canadian Pacific Railway—that is, from Fort William eastward—are to be reduced by from 10 to 33 per cent. at the beginning of 1898.
5. Rates on wheat and flour from Manitoba and farther west are to be reduced 11½ cents per hundred, beginning in 1898, and an additional 11½ cents per hundred, beginning in 1899.
6. Fifty thousand acres of picked coal lands are transferred to the Government.
7. Coal is to be put on the cars at the mines at not more than \$2 a ton.
8. The sale and price of timber lands, in the lands granted to the company, are to be subject to the regulation of the Governor General in Council.

Resources.—The bituminous coal, of which this region is the Pacific coast center, has steadily increased in production and sale. Large quantities are sent to San Francisco, the Hawaiian Islands, and China. The city of Vancouver is the mainland terminus of the Canadian Pacific Railway, and from its harbor the Canadian Pacific Railway steamships run to China, Japan, and Australia.

During recent years fruit-growing in the New Westminster district has been very successful, and apples, plums, cherries, pears, and even figs, have been produced with profit. In the Fraser river delta wheat has been grown to the extent of 92 bushels an acre, and oats 90 bushels to the acre. The Lilloet district during the past two years has come to the front as a gold region, and considerable milling gold has been found near the town of Lilloet, where the Golden Cache and other well-known mines are situated. There is good grazing land. The population in 1897 was still sparse and scattered.

The Yale district contains a mixed population of farmers, ranchmen, lumbermen, and miners. In it is the Okanagan valley, which is perhaps the best agricultural and pastoral section of the province, and the Nicola valley, where there are large areas of bituminous coal and iron ore and platinum. The chief towns are Agassiz, Yale, Kamloops, North Bend, Vernon, and Ashcroft, along the line of the Canadian Pacific Railway or its branches.

West Kootenay has become known during the past two years for its richness in minerals. It runs north and south from the Columbia river to the international boundary. During 1896-'97 the mining camps of Trail Creek, Rossland, Kaslo, and Nelson were developed into centers of population, and the output of ore during 1896 amounted to \$6,000,000. These mining districts are reached from Revelstoke, on the Canadian Pacific Railway, by a branch line to Arrowhead, at the head of the Upper Arrow lake, from which a recently established line of steamers runs to Nakusp, where rail communication is had with New Denver, Sandon, and other mining centers. Steamers have also been placed on the route to Robson, at the mouth of the Lower Kootenay, whence the Canadian Pacific Railway runs to Nelson, Rossland, and other points. The latter place was a small camp in 1894, and in January, 1897, had 6,000 people and a well-organized municipal system. The Slocan section of this district, north of Rossland, includes the best silver-producing mines. Near Nelson are the Silver King mines, purchased recently by an English company for \$1,500,000. During the summer of 1896 new and rich discoveries of gold, silver, and copper were made all through this Kootenay district. The wages of laborers are from \$2.50 to \$3 a day, of miners from \$3 to \$3.50, of mechanics from \$3 to \$4.

The East Kootenay district comprises the larger part of the region known by the name of "Kootenay," and is entered from the east by the Canadian Pacific Railway at Golden. It is a rich mineral country, but has not yet been worked to any extent. Within its bounds is a valley 300 miles in length containing the lakes from which the river Columbia has its rise, and providing excellent grazing resources. It contains much big game, and has large undeveloped oil fields. Field, Donald, and Port Steele are the chief centers of population.

Mineral Production.—In the Cariboo districts are the famous mines from which \$50,000,000 in placer gold has been taken since the early 'fifties." During the past three years a new impetus has been given to mining in this region, and various costly hydraulic plants introduced and operated. The district covers a large area with varying climates, and has no settlements of importance. It

contains one creek—the Williams—from which \$20,000,000 in gold has been taken within a distance of 2 miles. The Cassiar district occupies the whole western portion of the province. It contains some rich gold mines and large flour-milling establishments.

At the beginning of 1897 there were over 50 shipping mines in the Kootenay region. Large iron deposits also have been discovered recently on Texada island, and copper abounds at many points throughout the mainland. A ledge of emmalbar is being operated at Kamloops lake. Bituminous coal, as already noted, exists in large seams at various places, and anthracite is being worked on the Canadian borders of the province at a place called Anthracite. The following figures, prepared by the provincial Bureau of Mines, show the total mineral production from 1876 to the beginning of 1897: Gold (placers), \$57,704,855; gold (quartz), \$2,177,809; silver, \$4,028,224; lead, \$1,606,427; copper, \$254,802; coal and coke, \$33,934,427; building stone, \$1,200,000; other materials, \$25,000; total, \$100,931,604.

Fisheries.—The salmon fisheries of British Columbia are very valuable. During the seasons of the "runs" broad expanses of river, or deep pools, may be seen packed with masses of fish making their way to the spawning grounds. The greater number of the canneries where these fish are put up for export are on Fraser river, but there are some in the more northern part of the province. There are 55 canneries in the province, each employing about 500 men during the season. Each cannery costs from \$30,000 to \$40,000, equipped, so that about \$2,000,000 are thus invested. In 1876 the catch amounted to \$104,697; in 1880 to \$718,355; in 1885 to \$1,078,038; in 1890 to \$3,487,432; in 1894 to \$3,954,228. To this should be added the catch of halibut, sturgeon, herring, cod, etc. The total fishery production of the province in 1895 amounted to \$3,732,717.

Crown Lands.—Crown lands in British Columbia are classified as either surveyed or unsurveyed, and may be acquired by entry at the Government Lands Office by pre-emption or purchase. They may be pre-empted by any person who is the head of a family, a widow, or a single man over eighteen years of age and a British subject. Aliens may pre-empt Crown lands on making a declaration of their intention to become British subjects. The quantity of land that may be recorded or pre-empted must not exceed 320 acres northward and eastward of the Cascade or Coast mountains, or 160 acres in the rest of the province. No person can hold more than one pre-emption claim at a time and prior record or pre-emption of one claim, and all rights under it, are forfeited by subsequent record or pre-emption of another claim. Land, recorded or pre-empted can not be transferred or conveyed till after a Crown grant has been issued. Such land, until the Crown grant is issued, is held by occupation, and the occupation must be a *bona fide* personal residence of the settler or his family. The settler must enter into occupation of the land within thirty days after recording, and must continue to occupy it. Continuous absence for a longer period than two months consecutively of the settler or family is deemed cessation of occupation; but leaves of absence may be granted not exceeding four months in any one year, inclusive of two months' absence.

Homestead Regulations.—Farms and buildings when registered can not be taken for debt incurred after the registration, and are free from seizure up to a value not greater than \$7,500. Goods and chattels are also free up to \$500, while cattle "farmed on shares" are also protected by an exemption act.

Dominion Lands.—All the lands in British Columbia within 20 miles on each side of the Canadian Pacific Railway line are the property of the Dominion, with all the timber and minerals they contain (except the precious metals). This tract of land, with its timber, hay, water powers, coal, and stone, is now administered by the Department of the Interior of Canada, practically according to the same laws and regulations that control the public lands in Manitoba and the Northwest Territories, except that the homesteads must not only be resided upon and cultivated for not less than six months in each of the three years after entry, but they must also be paid for at the rate of \$1 an acre. Dominion lands in the province may also be acquired by purchase, free from settlement conditions. Agencies for the disposal of these lands have been established at Kamloops in the mountains and New Westminster on the coast. The minerals in this tract, other than coal and stone, are administered by the British Columbia Government.

Trade and Commerce.—Though the trade of British Columbia is still unimportant when compared with its extent and resources, it has greatly developed during the past few years, and is now the largest in the world per head of population, except that of Holland. In 1871 the imports were \$1,789,283 and the exports \$1,858,050, and in 1896 there were \$5,526,490 of imports and \$10,576,524 of exports. The exports include fish, coal, gold, silver, timber, furs and skins, fish oil, and hops. A large portion of the salmon, canned and pickled, goes to Great Britain, eastern Canada, the United States, South Africa, and Australia; the States and the Hawaiian Islands consume a large share of the exported coal; and great quantities of timber are shipped to Australia, some to South Africa, China, and Japan, and to places in South America. To Great Britain, China, and the United States are sent the valuable furs and peltries of land animals and the much-prized seal and otter. Valuable shipments of fish oil, principally obtained from dogfish at the Queen Charlotte Islands, are consigned to the States annually, and also to the Hawaiian Islands. Gold and silver ore is shipped annually to the smelters in the United States.

Minerals.—Including coal, the total output of the mines for 1895 was \$5,655,302, and for 1896 it was \$7,146,425. In 1895 the value of placer gold amounted to \$481,683, and in 1896 to \$544,025; gold quartz, 1895, \$785,271, and in 1896 \$1,244,180; silver, 1895 \$47,642, and 1896 \$190,926; lead, 1895 \$532,255, and 1896 \$721,384; coal, 1895 \$2,818,062, and 1896 \$2,327,145; coke, 1895 \$2,260, and 1896 \$3,075; other minerals, 1895 \$10,000, and 1896 \$15,000. For the past two years the production of coal has been decreasing by reason of the increasing competition of British and American coal in the Pacific coast market of the United States, where most of the coal is sold.

Timber.—British Columbia probably possesses the greatest compact reserve of timber now left in the world, and of this but a fringe has yet been cut. The coast districts claim the greater proportion of good accessible timber, and among this, the climate being humid, the ravages of forest fires—which have in part depleted the thinner and less valuable woodlands of the interior dry belt of the mainland—have not been severe. The timber limits of the coast follow the rugged shore line, fringe the mountain sides, and extend even to Alaska, while there is also much good timber in the Cowichan, Chemainus, Nanaimo, and other districts of Vancouver island, and on several of the gulf islands. Large and serviceable timber of lighter growth than on the coast also extends over wide regions of the mainland interior.

Among the province's principal timbers is the Douglas fir, widely distributed from the coast to the Rocky mountain tops. This grows to exceptional proportions on the coast, where it sometimes rises 300 feet in height and has a base circumference of 50 feet. A good average is about 130 feet clear of limbs and 5 feet in diameter.

A timber license may be granted for 1,000 acres for four years, on payment of \$10 annually and 15 cents for each tree (except hemlock); and no person not licensed may cut timber on Crown lands except for farming and mining. Only one license at a time is obtainable, and this is not transferable. A special license for 1,000 acres for one year may be obtained by application in the "Official Gazette" and payment of \$50 to the Chief Commissioner of Lands and Works.

Education.—The following were the educational figures of the last two years in the common schools:

ITEMS.	1895.	1896.
Number of schools.....	172	190
Teachers.....	183	199
Pupils.....	5,081	5,743
Average attendance.....	2,885	3,067

There were 26 graded schools, with 139 teachers and 8,257 pupils, in 1896. The high schools numbered 4, with 460 pupils. The expenditure upon teachers' salaries in 1895 was \$169,448, and in 1896 \$185,998, and the total expenditure by the Government upon education was respectively \$208,000 and \$234,335.

Miscellaneous.—The gross debt of the province was \$6,469,768 in 1896, with assets of \$1,798,456, and a yearly debt allowance from the Dominion Government of \$583,021. The seagoing tonnage of the province in 1896 was \$2,167,797, compared with \$2,228,047 in 1895. There were 800 miles of railway at the end of 1896.

BULGARIA, a principality in eastern Europe under the suzerainty of Turkey, formerly a Turkish province. It was created an autonomous, tributary principality by the Treaty of Berlin, signed on July 13, 1878. Eastern Roumelia, which was constituted an autonomous province, expelled the Governor General nominated by the Porte and proclaimed its union with Bulgaria on Sept. 17, 1885, and on April 6, 1886, the Sultan, after a conference of representatives of the signatory powers, issued a firman confiding the administration of the province to the Prince of Bulgaria and appointing him Governor General. Since then the two parts of Bulgaria have practically formed one nation. The Mussulman districts of Kanjali and Rhodope were retroceded to the Porte as a condition of the Sultan's acceptance of the *de facto* union of North and South Bulgaria. The legislative power is vested in a single Chamber, called the Sobranje, the members of which are elected by the votes of all adult male Bulgarians, in the ratio of 1 member to 20,000 inhabitants, for the term of five years. A specially elected Grand Sobranje must be convened to decide on the succession to the throne or amendments to the Constitution. The Prince of Bulgaria is Ferdinand, Duke of Saxony, the youngest son of Prince August of Saxe-Coburg-Gotha and Princess Clementine of Bourbon-Orleans, daughter of Louis Philippe, King of the French. He was elected by the Grand Sobranje on July 7, 1887, after the deposition of Prince Alexander, and was finally recognized by the powers in March, 1896. The heir to the throne is Prince Boris, born Jan. 30, 1894, son of Prince Ferdinand and Princess Marie Louise of Bourbon, eldest daughter of Robert, Duke of Parma. Prince Boris was baptized in the faith of his parents, who are Roman Catholics, but on Feb. 14, 1896, was received into the Greek Orthodox Church.

The Cabinet at the beginning of 1897 was composed as follows: President of the Council and Minister of the Interior, Dr. C. Stodoff; Minister of Foreign Affairs and of Worship, G. D. Nachevich; Minister of Public Instruction, C. Velnickoff; Minister of Finance, Ivan E. Gueshoff; Minister of War, Col. R. Petroff; Minister of Public Works, J. Madjaroff.

Area and Population.—The area of the original principality is estimated at 24,360 square miles, and that of Eastern Roumelia, now called South Bulgaria, at 13,500 square miles. The total population at the census of Jan. 1, 1893, was 3,309,816, of whom 992,386 lived in South Bulgaria. The total population comprised 2,504,336 Bulgars, 569,728 Turks, 60,018 Greeks, 51,754 gypsies, 27,351 Jews, 3,620 Germans, and 1,379 Russians. Sofia, the capital, has 47,000 inhabitants, and Philippopolis, the capital of Eastern Roumelia, 36,033. The number of marriages in 1893 was 31,640; of births, 141,320; of deaths, 92,100; excess of births, 49,220. The population was divided in 1893 in respect of religion into 2,695,905 Greek Orthodox, 643,243 Mohammedans, 27,351 Israelites, 22,617 Roman Catholics, 6,643 Armenian Gregorians, and 2,384 Protestants. There are 3,844 elementary schools, where free education is provided for children between the ages of eight and twelve, the expense being borne in equal shares by the state and the communes. Fewer than half the boys and not one in six of the girls of school age attend school.

Finances.—The revenue for 1896 was estimated at 91,439,100 lei, or francs; the expenditure at 90,957,609 lei. Of the revenue 33,777,895 lei were derived from direct taxes, and direct taxes produced 34,260,000 lei. The chief expenditures were 22,474,671 lei for the army, 18,174,709 lei for the public debt, 9,242,924 lei for education, and 8,326,160 lei for the interior. The preliminary estimates for 1897 make the revenue and the expenditure balance at 83,320,000 lei. The public debt on Jan. 1, 1897, amounted to 169,814,404 lei, against which the Government shows assets in railroads, harbors, etc., valued at 157,200,806 lei. The debt statement does not include the debt of £1,000,000 due to Russia on account of the war of deliverance, nor the unpaid East Roumelian tribute, nor the Bulgarian tribute, of which none has been paid, nor the share of the Turkish debt to be charged to Bulgaria.

The Army.—All able-bodied Bulgarians are liable to be called into military service. Of about 40,000 who reach the age of twenty annually 16,000 are taken by lot, and are required to serve two years in the infantry or three years in the other arms. The peace effective is 39,320 officers and men. The war strength of the army is about 175,000. The infantry arm is the Mannlicher rifle. The artillery is armed with 144 field guns and 12 mountain guns on the peace footing, with an equal number of field guns and twice as many mountain guns in reserve.

Commerce and Production.—The Government retains the legal title to the land, as under the Turkish *régime*, and the landholders have perpetual leases, descending in their families by inheritance. They pay to the Government a tithe of the agricultural produce, often collected in kind. Most of the farms are less than 6 acres. Pasture and woodland are attached to the communes and used in common. There are 9,770,700 acres under cultivation and 13,651,000 acres more suitable for cultivation. Wheat is raised extensively for export. Other products are wine, tobacco, flax, and silk. There were 7,060,300 sheep, 1,453,500 goats, and 441,000 hogs in 1892. Coal, iron, and salt are the principal mineral products. All mines belong to the Government. Greek, Roumanian, and Austrian merchants have most of the foreign trade. The

chief imports are textile goods, iron, and coal. The total value of the imports in 1895 was 69,020,295 lei, of which 22,532,000 lei stated for textiles, 7,895,000 lei for metals, 4,508,000 lei for colonial goods, 4,248,000 lei for timber and furniture, and 3,561,000 lei for machinery. The exports of grain to England, Germany, France, and Turkey amounted to 60,473,000 lei out of the total sum of 77,685,546 lei for all exports. The exports of live stock amounted to 5,082,000 lei. The article of *raison de commerce* is largely made in Bulgaria. Other exports are butter and cheese, skins, flax, and timber.

The trade with foreign countries in 1895 is shown in the following table, which gives the values in lei:

COUNTRIES.	Imports.	Exports.
Great Britain	15,365,811	14,197,624
Turkey	8,919,475	22,562,566
Austria	21,768,848	3,322,161
Germany	6,756,565	13,428,184
France	3,665,366	12,006,076
Belgium	1,697,837	5,323,563
Russia	3,407,032	71,658
Italy	1,907,656	1,185,392
Roumania	1,922,605	269,796
Servia	1,657,671	97,969
Greece	566,638	2,066
Switzerland	143,792	91,694
United States	250,179	3,967,321
Other countries		
Total	69,020,295	77,685,546

Navigation.—There were 767 vessels, of 457,902 tons, entered at the port of Varna during 1895, and 773, of 455,411 tons, cleared; at Bourgas 575, of 279,128 tons, were entered.

Communications.—There were 522 miles of railroad in 1896. The state telegraph lines have a length of 3,034 miles, with 6,042 miles of wire; in 1894 the number of messages sent was 1,203,024. The number of letters, newspapers, etc., that passed through the post office in 1894 was 9,617,000. The receipts of the postal and telegraph services were 2,303,474 lei, and expenses 2,344,264 lei.

Political Events.—While the trial of the murderers of Stambuloff was proceeding the widow of the murdered statesman, when brought reluctantly into court to testify, demanded why, instead of the miserable tools, the real assassins, the men who form the present Government of Bulgaria, were not placed on trial. The trial was concluded at the beginning of January, 1897, with the conviction of the actual perpetrators. On Jan. 2 the *Sobranje* passed a decree granting an amnesty to all Bulgarian officers who deserted and took service under the Russian flag after the deposition of Prince Alexander. A bill introduced by the Minister of War restores their pensions to officers who entered the Russian service subsequent to Aug. 9, 1886 and have served ten years in both armies. Pending the coming into operation of the new customs treaties on May 1, 1898, a provisional import tariff was imposed on all goods coming from abroad. The Minister of Finance, in presenting the budget, said that Bulgaria had no floating debt, and was under no necessity of contracting new loans, although an additional railroad would be built which will serve as a supplementary guarantee for the whole debt, consisting of the Russian occupation debt, the East Roumelian tribute, and three loans amounting to 169,814,404 francs, of which Bulgaria had received the net sum of 152,310,500 francs. The total assets of the state were 157,200,806 francs, consisting of completed railroads worth 92,368,323 francs and harbors in the course of construction on which 22,846,430 francs had been expended, and 41,985,853 francs invested in the National Bank and laid out on public buildings.

During the Greek war some 100,000 Bulgarian

insurgents crossed the Macedonian frontier. The Government took prompt steps to check the agitation. The Bulgarian Government declined to recall its representative from Athens when called upon to do so by the Porte as suzerain. The Bulgarian agent in Constantinople demanded the issue of *berat*s for five more Bulgarian bishops in Macedonia, threatening in the event of refusal that the Bulgarian army would be mobilized at once. The Sultan promised to grant the *berat*s, but asked the Bulgarian Government to have patience until the termination of the war with Greece. The influence of Russia restrained Bulgaria from taking any advantage of Turkey's difficulty. When the war was ended the Austrian and Russian governments addressed an identical note to the Balkan states expressing satisfaction at their correct attitude during the crisis. In August Prince Ferdinand visited the Sultan in Constantinople, and received from him satisfactory assurances regarding the

*berat*s. The Prince had previously visited other courts and had conferences with the Kings of Servia and Roumania. Capt. Boitcheff, the Prince's aid-de-camp, was convicted of murdering an Austrian actress, and a few days later newspapers printed interviews with Dr. Stoiloff, imputing political animosity as the motive of the Austrian Government for insisting on his punishment. The Austro-Hungarian agent, Baron Call, was consequently withdrawn from Sofia until the Bulgarian Premier denied the offensive expressions. A ministerial crisis was settled by the reconstruction of Dr. Stoiloff's Cabinet on Sept. 7. Gueshoff, Minister of Finance, retired, and Theodoroff, previously Minister of Justice, took his portfolio, being succeeded by Zgureff, his chief subordinate, while Velitchkoff was appointed Minister of Commerce and Agriculture, transferring the portfolio of Public Instruction that he held before to Vassoff, a Deputy.

C

CALCULATING MACHINES. Machines for simplifying arithmetical processes and for performing the mechanical work incidental to addition, multiplication, division, and subtraction have been employed for many years in astronomical observatories, institutions of learning, and business houses. The basic principle of mechanism in nearly all these is the gearing of wheels to the ratio of one to ten. Sometimes figures, from 0 to 9, are placed directly on these wheels and brought to an opening, so that the answers may be read; sometimes they are arranged to print at a certain point, so that the answer appears on a slip of paper; and sometimes the wheels direct pointers on dials to give the required visual results. The illustration shows a mechanism of the first-named character.

DIAGRAM SHOWING THE PRINCIPLE OF OPERATION OF FIGURE WHEELS FOR CALCULATING ADDITION AND SUBTRACTION.

The gear wheels, *a*, *b*, and *c*, each have 100 teeth and bear 100 pins, *p*, *p*, *p*, on their faces. The pinions 1 and 2 each have 10 teeth, as do also the pinions 3, 4, and 5 of the figure wheels, and the idle gears 6, 7, and 8. Circular graduated scales or dials are indicated at *d*, *d*, and *d*. One tenth of a rotation of the crank *a'* turns a one tenth of its circumference and brings 10 pins in contact with the pinion 3, causing the figure wheel *a* to make a complete rotation; at the same time the pinion 1 turns the gear *b* one tooth, and a pin on *b* turns the pinions 6 and 4 and causes the figure wheel *b'* to turn one figure. A complete rotation of *a* is required to turn the figure wheel *c'* one figure. The figure wheels may be arranged with springs and stops so as to make one tenth of a rotation instantaneous when a pin bears on the pinion, so that

c', which represents hundreds, will turn only at the completion of 10 turns of *b'* instead of turning one tenth of a figure at each turn of *b'*. If it be desired to add, say 149 and 546, with these wheels, they are first set at 149, as here illustrated, and the dial of *a'* is set at zero. If, then, *b'* be turned around five times (or *c'* be given half a turn—either scores 500), and then *b'* turned to 46 on its dial, the figure wheels will be so rotated as to have carried around 546 more points, or to 695, which is the answer. It will be apparent that subtraction may be accomplished by a reverse process. By an extension of this principle some of the most difficult arithmetical problems may be solved mechanically.

One of the best known of these machines of recent design is that introduced by Dorr E. Felt, of Chicago, in 1889, and improved in 1896. This is in use at Cornell University and other scientific institutions. The operation is made extremely simple by the introduction of a keyboard, which may be manipulated like that of a typewriter. The keys are placed so as to form rows in two directions, numbered from left to right, and also to and from the operator. This machine will not only perform the four principal arithmetical operations, but will also extract a cube root. In no case is it necessary to strike more keys than there are figures in the problem given to the machine to solve, and in the latest machines the answer is delivered on a printed card. If there is any doubt in the mind of the operator as to whether he struck the keys correctly in setting up the problem, he has only to repeat the operation, and see whether he gets the same result. In adding, one set of figures is struck on a row in one direction, and the other set on a row at right angles. In multiplying three figures by three figures the operator has only to select three certain keys, which may be done very promptly as soon as the keyboard is memorized.

The Thomas machine is commonly used in France, and the Tate machine, which is an improved form of the Thomas, is much used in Great Britain. The Odhner machine has been used to some extent in Poland. Babbage's difference machine, which cost £20,000, is used in England for trigonometrical and logarithmic calculations. The machine devised by George R. Grant, of Cambridge, Mass., has found considerable sale. This, like most of the foreign machines, is operated by a small hand crank. It employs a series of adding rings, registering wheels, and pointers. Both add-

ing rings and registering wheels bear numbers from 0 to 9. In multiplying, the adding rings are set to read the multiplicand and the registering wheels the multiplier and then, by rotating the crank and shifting slides in accordance with certain rules, the answer may be read on recording wheels.

The Scheutz machine is used at the Dudley Observatory, Albany. It operates on the method of differences, and calculates to the fifteenth place of decimals, and can express numbers either decimally or sexagesimally, the answers being delivered in printed form.

The Hollerith electric tabulating mechanism is used in computing results from the United States census returns. The system includes three machines—one for punching holes in cards, a second for tabulating them according to the holes punched, and a sorting box. The punching machine has a keyboard of 240 characters, each representing one of the 240 answers to questions asked by census takers—as black, white, married, single, native born, foreign parentage. A pantographic guide is swung over the keyboard, connecting with a set of punches in the rear of the machine. A blank card being fed in to represent an individual in the return of some census sheet, the guide is placed over the proper keys, and the card is punched with holes, the position of which indicates the facts in the case of that individual. Although there are 240 possible facts in each case, the average to be recorded is but 15, so that the cards may be punched very rapidly as read from the returns. The cards of a single State are then fed into the tabulating machine, which has electric devices for making connections through the holes of each card and shifting the mechanism of dials as fast as the holes are thus noted. When a set of cards has been passed through the machine the dials record the totals of each of the 240 facts, so that it is only necessary to copy the records of the dials to know how many of the people in that State are blind, insane, married, foreign born, etc. The sorting box serves to obtain answers to all sorts of cross-questions—as, for instance, if it is desired to know how many State-prison inmates are of native birth, or how many single persons are white and how many colored, and so on through the whole range of possible combinations. Its work is accomplished by adjusting the electric connections to take note of every card in a set introduced which has answers to the two questions concerning which the cross inquiry is made. With this mechanism a great number of interesting statistics are compiled and added to the census reports at a nominal expense. The only chances of error are in the original punching of the cards, and such errors affect only one figure and not totals, so that the results obtained by this system of calculation are certainly more accurate than when clerical labor was employed in all the calculations.

CALIFORNIA, a Pacific coast State, admitted to the Union Sept. 9, 1850; area, 155,350 square miles. The population according to each decennial census since admission, was 92,597 in 1850; 379,994 in 1860; 560,247 in 1870; 864,694 in 1880; and 1,208,130 in 1890. Capital, Sacramento.

Government.—The following were the State officers during the year: Governor, James H. Budd, Democrat; Lieutenant Governor, William T. Jeter, Democrat; Secretary of State, Lewis H. Brown, Republican; Treasurer, Levi Rathbun, Republican; Attorney-General, William F. Fitzgerald, Republican; Comptroller, E. P. Colgan, Republican; Superintendent of Instruction, Samuel T. Rusk, Republican; Surveyor-General, Martin J. Wright, Republican; Superintendent of State Printing, A. J. Johnson, Republican; Insurance Commissioner, M. R. Higgins,

succeeded in May by Andrew J. Chase, Chief Justice of the Supreme Court, W. H. Beatty, Republican, Associate Justice, T. B. McFarland, Republican, C. H. Garoutte, Republican, R. S. Hastings, Republican, W. C. Van Fleet, Republican, F. W. Henshaw, Republican, and Jackson Tongue, Republican.

JAMES H. BUDD, GOVERNOR OF CALIFORNIA.

Finances.—The following statement of the condition of the general fund was made in February: Balance, Feb. 15, 1897, \$2,611,406.61. Anticipated receipts—property tax, second installment estimated, \$756,343.84; railway taxes, second, \$48,084.11; State officers' fees, estimated, \$15,000; pay for inmates of Whittier School, \$12,000; pay for inmates of Preston School, \$4,000; total, \$844,437.06. Balance in available appropriations, Feb. 15, 1897, \$1,527,575.88. Appropriation for construction of debris dam, \$250,000; estimated expenditure for organs, etc., \$250,000; Indian war bonds, \$116,782.17; contingent expenses, Assembly, \$20,000; contingent expenses, Senate, \$12,500; salaries of Commissioner of Public Works and secretary for four months, \$1,600; to meet ordinary expenses of State Government for five months from July 1, at \$250,000 a month, \$1,250,000. Other items make the total \$3,429,124.70. Balance, \$17,908.80.

Two county treasurers, those of Sacramento and Modoc, suffered from peculations by officials; and it was charged that a loss from another, Sonoma, in December, 1894, supposed to have been by burglary, was by the dishonesty of the county treasurer.

Education.—The school census completed in July, shows a gain of 10,179 over that of 1896. The figures this year are 340,888. The amount of money apportioned to the schools in January from the State treasury was \$1,904,882.84, being \$5.76 per capita.

On July 1 there was in the State treasury, to the credit of the schoolbook fund, \$5,297.80. In addition to this there were books on hand valued at \$119,975.45. Deducting the estimated value of the unsalable books, left a total of \$113,777.99 in cash and salable books.

The corner stone of the old State House was laid

March 27 on the college site south of Golden Gate Park. President Kellogg, of the State University, made one of the addresses, in which he said:

"Years ago an effort was made to provide our colleges of law, of medicine, of dentistry, and of pharmacy with a suitable common home. A request for aid was made to the State Legislature. Twice it received favorable treatment from the two houses, but was not welcomed at the executive threshold. Two years ago this request was repeated, and an appropriation of \$250,000 received the signature of Gov. Budd. Still a site was needed, and there was a further delay. Then came the offer of Adolph Sutro, which fixed the location of these colleges on this commanding and beautiful site."

The Board of Regents selected a site for the proposed Warming Trades' School in the Potrero addition in San Francisco. There was lively competition between that city, Alameda, and Stockton for the school. The original donation of \$400,000 has been well invested, and amounts to \$435,000.

A deed of gift was made in February by Mrs. Jane Stanford to the university which bears her son's name, of her residence and grounds on the corner of California and Powell Streets, with all its valuable contents. Upon the deed becoming effective, the property "shall be dedicated and set aside as an affiliated college of the Leland Stanford Junior University, or as a library for the use of the students of the said university and the people of the city and county of San Francisco, or for some benevolent purpose for the instruction of the said students; but the same shall never be appropriated for the use of a clubhouse or boarding house, or place of undignified amusement." The residence and grounds are estimated as worth \$250,000, and the whole donation may be put down as equivalent to \$1,000,000.

The college of agriculture at the State University was destroyed by fire April 16. The flames consumed much valuable apparatus, records of many years' investigations, and manuscript and specimens representing the life work of Prof. E. W. Hilgard, head of the department and founder of the experiment-station system in the United States. Fire extinguishers were brought from various parts of the university, but were of no avail, from the fact that certain of the students, a few days before, for no further apparent reason than distinguishes many of their pranks, had emptied the contents and rendered the safeguards useless. The agricultural building is plentifully supplied with hose, but when the necessity for use arose it was found that none of it would fit the mains. The building was completely wrecked, and the loss, apart from valuable manuscripts and records, is estimated at \$25,000 to \$30,000. Prof. Hilgard's personal loss was great. It included his herbarium, containing over 10,000 specimens and manuscripts representing the work of forty-five years. The professor's geological data, gathered in the Mississippi valley and arranged by him for publication, the great work of his life, was reduced to ashes. A new building on the foundations of the burned structure was at once planned and was expected to be in readiness soon after the opening of the fall term.

State Institutions. The appropriations for these were materially reduced in the legislative bill as it finally became a law. The State Board of Examiners passed a resolution in May declaring that "for the forty-ninth and fiftieth fiscal years the various State institutions, commissions, departments, and offices must be supported by the appropriations made by the Legislature for that purpose, as the State Board of Examiners will not grant deficiencies in the appropriations made for their support or for any other purpose."

Abuses were alleged to exist at the Preston School of Industry, at Lone, and an investigation was made by the Secretary of State, who reported that "it would be a great deal better that the school were abolished than allowed to go on as it is. There were two factions among the employees. Though called an industrial school, it has no machinery, tools, or implements for teaching useful trades."

The prisoners at San Quentin Penitentiary, of whom there are about 900, revolted in June and refused to work in the jute mill, demanding less work and better food. After several days' trouble they were subdued, those who were most refractory being brought to terms at last by the guards turning a hose into their cells and playing water upon them until they promised to return to their work. The revolt was said to have been incited by the opium eaters among the prisoners, from whom the rigorous rules recently enforced have shut off their supply.

Banks.—The reports of the Bank Commissioners show the condition of the banks, Feb. 27, to have been prosperous.

The total assets and liabilities of the 10 savings banks of San Francisco is \$110,343,677.47. The liabilities are as follows: Capital paid up, \$4,260,000; reserve and profit and loss, \$4,896,815.86; due depositors, \$100,049,095.11; other liabilities, \$1,137,766.50.

The total assets and liabilities of the 16 commercial banks of the city is \$62,773,707.98. The liabilities are: Capital paid up, \$14,317,883.67; reserve and profit and loss, \$10,701,993.70; due depositors, \$30,983,633.14; due banks and bankers, \$4,427,787.56; other liabilities, \$2,342,409.91.

The 20 private banks of the State reported: Total assets and liabilities, \$2,420,349.24. Liabilities—capital paid up, \$1,018,762.90; reserve and profit and loss, \$330,731.23; due depositors, \$956,088.72; due banks and bankers, \$24,199.31; State, county, and city money, \$49,135.71; other liabilities, \$41,431.37.

The 46 savings banks outside of San Francisco reported: Total assets and liabilities, \$31,372,061.97. Liabilities—capital paid up, \$3,894,025; reserve and profit and loss, \$1,326,328.28; due depositors, \$25,834,140.43; due banks and bankers, \$43,606.02; other liabilities, \$273,261.34.

The 157 commercial banks outside of San Francisco reported: Total assets and liabilities, \$53,143,603.98. Liabilities—capital paid up, \$19,139,847.50; reserve and profit and loss, \$6,811,118.81; due depositors, \$24,983,873.02; due banks and bankers, \$1,515,260.84; State, county, and city money, \$4,423.83; other liabilities, \$689,080.98.

The Randall Banking Company, of Eureka, failed in April, with liabilities of \$212,000.

Railroads.—Ground was broken in October for the Randsburg and Kramer road, which is to give Randsburg and the adjacent mining country access to the markets of San Francisco and Los Angeles. Starting from Kramer, a station on the Santa Fé Railroad, 35 miles southeast of Mohave, it runs over a gently undulating prairie 28 miles to Johannesburg and Randsburg.

The Sierra Pacific Railway, from Oakdale to Jamestown, was finished, and the event was celebrated Nov. 10.

The work on the San Joaquin Valley road has been pushed rapidly during the year. A long tunnel is to be bored on the section between Point Richmond and Stockton, a work which, it is estimated, will take not less than five hundred days.

Water Ways.—The board appointed by the President to decide upon the location of a deep-water harbor for commerce at either San Pedro or Santa Monica made its report to the Secretary of War

March 2. It definitely locates the harbor at San Pedro, at an estimated cost of \$2,901,787. The improvement contemplated is a stone breakwater beginning about 2,100 feet from the shore and extending in a straight line 300 feet; thence on a three-degrees curve about 1,800 feet; thence in a straight line 3,700 feet to the end.

The naval appropriation bill carried a large amount to be expended at Mare Island Navy Yard, of which a part was for dredging and work upon the sea wall.

Congress appropriated about \$60,000 for improvement of the San Joaquin river, for widening and deepening two cuts which have been a source of trouble to steamboat men.

Mining.—According to the report of Charles G. Yale, statistician of the branch mint, the State produced in 1896 precious metals to the value of \$17,604,026.30, of which \$17,181,562.70 was gold, and the remainder silver. Compared with the product of 1895, these figures show an increase of \$1,847,245.01 in gold, and a decrease of \$177,353.10 in silver.

The number of counties producing \$1,000,000 or more has increased from five to seven, the new comers being Siskiyou with \$1,091,917.47, and Tuolumne with \$1,070,470.13. The best showing is made by Nevada County, whose product of \$2,389,340.42 not only maintains that county in the first rank, but indicates an increase of \$599,124.76. Tuolumne comes next in growth, with an added product of \$403,403.36.

There is a discrepancy between the figures given above and those of the director of the mint, R. E. Preston, who placed the total field of gold at \$15,535,900. He based his estimates on the deposits of auriferous gold at the mints and assay offices, identified upon information given at the time of deposit as produced in California, and from the reports received from private smelting and refining works in the United States, giving the amount of their product derived from ores mined in California in 1896. It is claimed that even the larger figures fail to give full credit to all the counties, and fall short of the actual total.

The Randsburg district in the south continues to attract miners and prospectors, and rich strikes have been reported at other points, notably in Trinity County. A nugget was found in the Blue Jay pocket in that county worth about \$42,000. This is the most valuable one ever found in the State, with the possible exception of one found in Calaveras County in 1854, which was reported to have weighed 195 pounds troy, and to have been worth more than \$43,000.

The total mineral product of the State in 1896 is given as \$24,291,398. The minerals whose value rises into the millions, aside from gold, are petroleum, \$1,180,793, and quicksilver, \$1,075,449. The value of borax reported was \$675,400; of brick clay, \$524,740; of macadam, \$510,245; of asphaltum, \$362,590; of mineral water, \$317,434.

A report of the gold mills by the State mineralogist gives the following statistics:

There are in operation in California 754 mills and 109 arrastras. These mills contain 6,221 stamps, an average of a little over 8 stamps per mill. The total number of concentrators in use is 757. Five mills are worked by electricity, 300 by water, 185 by steam, 2 by gas, 4 by gasoline, and 2 by horse power.

Coal mines were opened in March at Corral Hollow, 36 miles from Stockton. The veins have been prospected for 5 miles, and to a depth of 600 feet.

The State Miners' Convention met in San Francisco in October. J. H. Neff was elected president

for a sixth term. It was resolved that measures be taken to have plans made without further delay for expending the State and Federal appropriations for impounding dams and improvement of the navigable rivers, in order that boating, hunting may be restored without injury to the streams or adjoining lands. Steps were taken toward the preparation of exhibits at the Omaha Exposition and at the Paris Exposition of 1900.

Other Products.—The following statistics of farming operations in the State were given for 1896:

The area seeded in cereals was about 10 per cent. greater than in 1895. The wheat crop of 1896 is estimated at 20,000,000 bushels, against 20,000,000 in 1895, showing an increase of 9,000,000. During the year India took 800,000 bushels of wheat from us, and Australia flour and wheat to the equivalent of 1,000,000 bushels.

In the horse market the report estimates a decrease of 10 per cent in the number of our horses compared with 1895.

In respect to the sheep industry the report notes its decline from 1876, when 7,000,000 sheep yielded 56,550,970 pounds of wool, which at 15 cents in San Francisco brought in about \$10,000,000, to the present time, when about 2,500,000 sheep yielded a wool product last year of only 27,195,550 pounds, of a value hardly more than nominal.

In meats the report states that European demand has caused Eastern buyers to reach out much farther West than heretofore. The product of beet sugar in this State in 1896 is stated at 64,500,216 pounds.

The total pack of fruit in 1897 was estimated at 1,750,000 cases, or 42,000,000 cans, an increase of at least a third over that of 1896.

It is said that a citizen of Santa Rosa has found a method for producing at small cost a good substitute for India rubber. It is made from the gum of a tree which grows abundantly in Sonoma County and which has been named the *Olea elastica* because of its yield of a considerable amount of this gummy substance. It vulcanizes readily, and can be put upon the market for less than one fourth the cost of the best rubber.

The wine crop of 1895 was about 16,000,000 gallons; that of 1896 was somewhat smaller; and that of 1897 was estimated to be smaller still. The crop of grapes tends to diminish year by year, as no new vineyards are planting, while the vine pests are constantly at work. Vine growers were discouraged by the low prices a few years ago.

Experiments with tobacco culture in San Diego County have proved quite successful. In one case lately reported three acres yielded \$1,000 worth in one season.

Protection for Sea Birds.—At the solicitation of the Committee on Bird Protection of the American Ornithologists' Association, the Lighthouse Board at Washington, which has the affairs of the Farallones in charge, has issued a decree that the traffic in the eggs of the sea birds must cease. The mandate of the Lighthouse Board will bring to a close a unique industry of San Francisco. The eggs of the murre, or foolish guillemot, have been shipped to the markets of the city in great quantities ever since 1849, at which date they were almost the only fresh eggs to be had, bringing over \$1 a dozen. The birds were present in the breeding season from May until August on the islands in such countless thousands that although persistently taken their numbers seemed to show no appreciable diminution. In recent years, however, naturalists have noticed the effect of the annual persecution of the vast colonies and several had fears that they might become extinct.

A New Town.—Following is an account, given in September, of a town made to order:

"In the last three weeks there has sprung into existence up in Sierra County, close by the Nevada line, another such town as Pullman—a city built upon and around a great industry. Overton is the name of the town. It is the result of the proposed exploitation of the immense timber tracts in the vicinity which were acquired by the late Walter S. Hobart during the last thirty years of his lifetime and subsequently by his executors. They comprise 70,000 acres of white, yellow, and sugar pine and fir—all a virgin forest. Of this vast area of timber 40,000 acres are to be cut, sawed, and manufactured, an operation which it is estimated will occupy the time of a large force of men and the employment of much machinery for sixty years to come. A broad-gauge railroad has been built to Truckee on the Southern Pacific, 7 miles, as well as a standard spur of 2 miles to the timber belt, and 7 miles of narrow-gauge track are to be used as a logging road into the hills and mountains."

Centennials.—The hundredth anniversary of the founding of Mission San José by Friar Fermín Francisco de Lasuen was celebrated June 13. An altar was prepared on an elevated platform, and mass was celebrated in the presence of about 10,000 people, after a procession made up of a great number of companies and societies. After the religious services all who were in attendance were provided for at a barbecue in Spanish style in the beautiful Palmdale grounds, which date their beginnings from the foundation of the mission. To the substantial of the repast were added the pure wines of the Gallegos cellar.

An incident of the celebration was the presence of an Indian, Felipe José Marziano, one hundred and twenty years old, who was present when the mission was founded, and remembers the simple ceremonies of that occasion.

On June 24 a similar celebration marked the hundredth anniversary of the founding of the town and mission San Juan Bautista.

Los Angeles.—A tract of 3,000 acres has recently been given to this city for a park. It is just beyond the northern line of the city, and includes 2½ miles of frostless foothills bordering on Cahuenga valley, 5 miles of Los Angeles river bottom lands, and a beautiful little valley, which was called the Press Colony site; also, with these lands the improvements thereon, consisting of several buildings and water plant, with tunnels and piping. This park will include more than 2,000 acres of tillable land, and some of the most romantic scenery of any park in the world. The land is the gift of Mr. G. J. Griffith, formerly a newspaper man in San Francisco, and is to be called Griffith Park. The giver asks that no railroad that may be chartered to lead to the park shall have the right to charge a fare larger than five cents. The value of the land is between \$200,000 and \$300,000.

Legislative Session.—The Legislature convened Jan. 4 for its thirty-second session, and adjourned March 21. Thomas Flint was chosen president *pro tem.* of the Senate, Frank L. Coombs was Speaker of the House, and B. C. Kenyon Speaker *pro tem.*

In his message to the Legislature the Governor called attention to the need of economy in State affairs, the expenses of which had been steadily increasing during the past ten years. In regard to State institutions he said:

"The State Board of Examiners found salaries and wages for the same service exceedingly disproportionate; the number of employees excessive; that there was no uniformity in the system of keeping books, warrants, or checks; that attendants in the

various asylums vary greatly in their ratio to the inmates thereof; that employees frequently increased in number and the pay roll was augmented by thousands of dollars, while the number of patients remained stationary or decreased."

Some savings, however, have been effected, the Governor said, during his term, among which was the saving in the expenses of management of the State Insane Asylums of \$65,321.31 from their appropriations for the year ending June 30, 1896, and of \$20,070 for the five months ending Dec. 1. Other economies and reductions of expense to the State pointed out as accomplished, in accordance with his suggestion on co-operation, were the transfer of the duties of the Viticultural Commission to the University of California at a saving of \$30,000; the transfer of the offices of the Horticultural Commission to the State Capitol, saving \$20,000; the disapproval of appropriations to agricultural societies, aggregating \$193,000; the repeal of the law granting support to aged indigents, saving \$400,000 a year, and of the coyote scalp law, saving \$100,000 a year. The reorganization of the National Guard has also effected a great saving. The Board of Examiners has eliminated items amounting to \$66,362.74, and rejected claims aggregating \$682,639.

An election of a successor to George C. Perkins in the United States Senate being in order, Mr. Perkins was nominated by the Republican caucus, Jan. 5, and was elected, Jan. 12, by a vote of 74 to 45. The Democratic vote was divided among James G. Maguire, W. W. Foote, John J. Dwyer, B. F. Langford, and Charles Lane. The People's party vote went to T. V. Cator.

The session was conspicuous for accusations and investigations.

A scandal arose in the beginning of the session in regard to the temporary organization of the Assembly. It was charged that the chief clerk, who had the authority to appoint the necessary clerks, porters, etc., had put upon the list almost 100 persons more than are required by law for the House when fully organized; that these persons were placed upon the pay roll and allowed mileage and *per diem* for several days for the purpose of paying political debts. An investigation was ordered, and the committee reported that the charges were substantiated. The total amount expended needlessly was found to be \$4,215.

Still another scandal of the session was that concerning the "coyote scalp bounty claims." This bill appropriated \$287,000 for paying back claims for coyote scalps. "The bulk of the coyote claims," said the "San Francisco Chronicle," "has been known for years to be fraudulent, and on that account principally the bounty law was repealed in 1895. Thousands of coyote scalps were taken from county to county, certified in each, and not destroyed. Coyote farms were established, especially in Kern County, where, according to the report of Expert Moore, 20,000 fraudulent scalps were entered at a charge against the State of \$100,000. Eastern wolf scalps, or scalps collected among furriers in Eastern markets, were brought West during the years when the bounty was in force, and made to yield from \$5 to \$25 each by collusion with county officials." The bill passed the Senate by the casting vote of the Lieutenant Governor. In the Assembly it was defeated, but there was a call of the House and 15 men changed their votes. The Committee on Commissions, Retrenchment, and Public Expenditures was directed by the Speaker to investigate the charges of bribery. The committee took possession of the telegrams sent and received in Sacramento March 5 and after; among them were found 14 which had a direct bearing on the bribery charge; the committee submitted these

to the Assembly with the report that their belief was that money had been used to pass the bill. There was a protest in the House against the reading of the telegrams, because they were obtained by seizure; and threats of prosecution were made. They were real, however. Most of the dispatches were from lobbyists to interested men in Bakersfield and Tulare. The action of the committee in securing the telegrams was approved by vote of the House. The Governor did not sign this bill for coyote claims.

An investigation was also made of the State printing office. The Governor vetoed a bill for \$75,000 deficiency, and made charges of extravagance, which were investigated and pronounced unfounded. The bill appropriating \$275,000 for the work of the office for the coming biennium was vetoed; also those of \$6,000 for the printer's salary and \$40,000 for the support of the State school text-book department of the office.

The State printer said that, as the Board of Examiners can only grant for a deficiency where an appropriation has been made, nothing could be allowed him during this biennial period, and he should therefore close his office on July 1 for the remainder of his term.

Still another investigation was made in connection with a bill for the government of State normal schools. It was charged that the bill was tampered with at the instigation of the president of the Board of Trustees of the San José Normal School. The findings were that he had sent a telegram to the State printer asking him to blockade the bill, and a similar one to the chief clerk of the Senate, and had corresponded on the subject with the Assembly clerk. The bill twice reached the Governor improperly enrolled and with an amendment which did not belong in it. The strong point in the bill is that it provides for a continuous board of trustees, one to be appointed for one year and one each for two, three, and four years. As the law now is the entire board is changed at the will of the executive, and any teacher may be forced out of employment. The changes made in the bill were amendments which had been proposed in the Assembly but receded from, making the law operative in 1899 instead of 1897, and omitting the clause giving the president of a school the right to nominate teachers. The trustee was removed. The bill was finally approved in its correct form.

The San Francisco "Examiner" having published a communication charging Senators with having been bribed to pass a certain bill, the managing editor and two of the legislative correspondents were called before the Senate. They refused to disclose the source of the information, and two of them were committed to jail for contempt, by a vote of 26 to 12.

A bill involving the expenditure of \$300,000 provided for dredging Sacramento river. There was much opposition to this bill, on the ground that its real object was to benefit the owners of a patent dredger, the purchase of which was provided for in the bill, and to drain for private owners swamp lands that were acquired from the State for little or nothing, with the understanding that they were to be reclaimed by the owners themselves; and also on the ground that it is not the province of the State "to expend money upon the improvement of navigation in California."

In speaking in favor of the bill, a Senator said that all the bill sought to do was "to demonstrate with the \$300,000 what could be done, so that Congress would be stimulated to take up the work." A proposed amendment to make the bill general and extend its operation to all the navigable waters of the State, apportioned according to the amount

of commerce on them, was rejected, and the bill passed by a vote of 27 to 12 in the Senate and 41 to 36 in the Assembly, and was approved by the Governor.

Another bill of like character, which also became a law, appropriated \$250,000 for restraining dams for the debris from hydraulic mines. The National Government had appropriated \$250,000 for the purpose. It was charged that, as the amounts called for by these bills would do scarcely more than make a beginning, the ultimate intention was to secure much larger appropriations in future, which the State would be obliged to make in order that the work now to be done should be made available.

An act in relation to stray stock was passed, which will relieve farmers from the necessity of fencing cultivated fields for protection against estrays.

Another law of special interest to farmers provides for wide tires on vehicles, and prescribes the width for various kinds of wagons. The act is to go into effect Jan. 1, 1900.

An act was passed which embodied the main provisions of the Torrens land system. A bill making new provisions for primary elections, a county government act, a new law for the National Guard, and an act providing for a uniform system of road government in the various counties were also among the enactments of the session.

The political code relative to State normal schools was so amended as to make the Governor and Superintendent of Public Instruction *ex-officio* members of each normal-school board, and the president of each school an *ex-officio* member of the local board of the school with which he is connected. Teachers are to be elected upon the nomination of the president of the local board, instead of by the local board, as formerly. Training schools for the kindergarten are added. A joint board of normal-school trustees is provided for.

Among other bills passed were the following:

To create a department of highways. This is a re-enactment of the law of 1893.

Providing that persons residing in any county may organize and incorporate mutual fire insurance companies.

Providing for the funding and refunding of the indebtedness of levee and protection districts.

Providing for the cession of lands to the Federal Government for military purposes, including tide lands adjacent to Goat island and lands adjacent to Lime Point and Black Point.

Prohibiting a candidate for legislative office from giving pledges to others than his party convention.

Adding to the list of personal property subject to mortgage goats, the equipments of a livery stable, raisins, and dried fruits; also all boxes, fruit graders, drying trays, and fruit ladders.

Adding to property heretofore exempt from execution one piano, one shotgun, and one rifle. It limits farming utensils exempt to \$1,000 in value; exempts one fishing boat and net of \$500 in value; seamen and seagoing fishermen's wages not exceeding \$100 and all material purchased in good faith for use in the construction, alteration, or repair of any building, mining claim, or other improvement.

Providing that all instructions given to juries, except such as might incidentally be given during the admission of evidence, shall be in writing, unless both parties request the giving of an oral instruction or consent thereto.

Adding a new section to the civil code concerning the marriage ceremony.

Allowing counties and municipalities to grant franchises for the construction of paths and roads for the use of bicycles and other horseless vehicles.

Fixing the minimum rate of pay for laborers employed on public work at \$2 a day.

Providing that unoccupied town lots in Government town sites shall be open to mineral claims.

Repealing the law requiring the translation and publication of laws into Spanish.

Prohibiting a mining corporation from selling, leasing, or mortgaging any part of the mining ground owned by it, or of purchasing new ground, without the consent of two thirds of the stockholders.

Permitting the recording of notices of mining claims without acknowledgment or certificate of acknowledgment.

Repealing the act of 1874 regulating the sale of mineral lands belonging to the State.

Prohibiting divorced persons from marrying within a year after the granting of the divorce.

Fixing the age of consent at sixteen years.

Requiring that when goods are purchased for the use of the State or any city or county in the State, preference shall be given to those produced or manufactured in the State.

Extending the application of the law on trademarks to those which are copied or imitated, as well as to those which are forged or counterfeited.

Establishing a free market on the water front of San Francisco under the care of the harbor commissioners.

Amending the act providing for the organization of municipal corporations, so that cities mentioned may own and operate plants for water supply and street lighting.

Requiring every corporation doing business in the State to pay its employees at least once a month all wages earned by such employees.

Providing for a public-school teachers' annuity and retirement fund, and amending the law of 1895 relating to the same.

Perpetuating the office of the Public Works Commissioner, who is to have control of the expenditure of the \$300,000 for the improvement of Sacramento river.

Entitling railroad passengers to carry bicycles as luggage.

Providing for a commissioner to the Central American Exposition at Guatemala city and an exhibit there, and appropriating \$10,000; also for an exhibit at the Hamburg Horticultural Exposition \$6,000.

The following joint resolutions were passed:

Calling for a constitutional convention.

Memorializing Congress to reject the railroad funding bill.

Asking protection in the new tariff for California fruit interests.

Asking Congress for an appropriation of \$300,000 to be used for restraining barriers for mining debris, and one of \$300,000 for dredging the water ways of the State.

Constitutional amendments were passed relating to the appointment of the Lieutenant Governor; to consolidated city and county governments, the object being to exempt San Francisco from the county-government act, and allow the city a large measure of home rule upon the adoption of a new charter; to sessions of the Legislature; and to grammar schools.

The tax-levy bill fixed the rate at 43½ cents, besides a 2-cent tax for the university, which will increase its revenue \$224,000 a year. This will raise more than \$10,000,000 for the general fund for the two years. The general appropriation bill called for \$5,343,178, the schools for \$4,620,926, orphans and half orphans for \$675,000, and the sinking fund and interest \$282,870, which constitutes a total of \$10,639,974.

There was a large increase in the appropriation for the National Guard. Provision was made for 5 new companies at \$3,380 each for equipment, and 1 company of Naval Reserves at \$1,600.

The Governor struck out many items from the general appropriation bill, amounting in all to \$603,929.

The appropriation of \$10,000 for an exhibit at the Tennessee Centennial Exposition was vetoed, and the appropriation for the State librarian and his two deputies; also appropriations of \$10,000 for viticulture experiments and \$8,000 for forestry stations, on the ground that the State University can support them hereafter from its increased revenues. The \$5,000 allowed for its department of agriculture was also stricken out, as were the following: \$25,000 for dredging Alviso slough, \$100,000 for improvements to the asylum at Napa, \$20,000 for a water supply at Monticello Asylum, \$35,000 for the Santa Clara State School for Girls (not yet established), \$90,000 for the Yountville Home, \$75,000 to establish a polytechnic institute in San Luis Obispo County, \$75,000 for a heating and ventilating plant at the Capitol, appropriations for district agricultural fairs, and a bill providing for the sale of State bonds to raise a fund for the use of the harbor commissioners in building a sea wall.

A resolution to cede the Yosemite Valley to the United States was defeated.

The total cost of the Senate was \$75,600.40, including more than \$4,000 for contested election cases; that of the Assembly was \$120,177.40.

Decisions on State Laws.—The Supreme Court decided in May that the section of the county-government bill of 1895 which provides for levying an inheritance tax is unconstitutional, inasmuch as it is an attempt to levy an extraordinary tax, and also that it provides that the fee so collected shall be paid into the county treasury and used for county purposes, whereas the Legislature is forbidden to impose taxes for county purposes.

On application of the Comptroller as to the effect of the veto of the item in the general appropriation bill for the support of the State printing office the Attorney-General decided that the State printing can not be legally done at any other place, and that no deficiency can be created for support of the office. This, if it shall be sustained, will do away with all State printing till the next session of the Legislature.

By a decision of the United States Supreme Court, May 24, in the litigation over the Merritt-Garcelon estate, Oakland will receive for a general hospital about \$600,000.

According to a decision in the United States circuit court in June, the authority of the State "is so absolute that the Federal power may legally intervene to prevent the passage into the Sacramento and San Joaquin rivers and their tributaries of even the light, flocculent matter which invariably escapes even the best impounding dams and makes its way downstream presumably to the sea." If this is sustained, the impounding dams to be built by the State, as provided by the Legislature, may be regarded as trespassing on the property of the Government, should it be found that injury to navigation results from the use of the dams by hydraulic miners.

In a case involving the ownership of San Pedro inner harbor, which was claimed by virtue of an old grant, the decision in May in the United States Supreme Court was against the title. The court holds that where a patentee of land accepts a patent and survey he has not recourse, in case of desire to contest, if the boundaries do not accord with the original lines.

CANADA, DOMINION OF. The year 1896-'97 marks an important period in the history of the Dominion. Not only has there been a change of government from the Conservative to the Liberal party, but a change in party policy and a distinct approximation toward Great Britain in fiscal affairs as well as in the sentiment evoked by the Queen's diamond jubilee. The ministry as constituted in December, 1895, was as follows: Premier, Sir Wilfrid Laurier; Minister of Trade and Commerce, Sir R. J. Cartwright; Secretary of State, Hon. H. W. Scott; Minister of Justice, Hon. David Mills; Minister of Marine and Fisheries, Sir Louis Davies; Minister of Militia and Defense, Hon. F. W. Borden; Postmaster-General, Hon. William Mulock; Minister of Agriculture, Hon. S. A. Fisher; Minister of Public Works, Hon. J. Israel Tarte; Minister of Finance, Hon. W. S. Fielding; Minister of Railways and Canals, Hon. A. G. Blair; Minister of the Interior, Hon. Clifford Sifton; Minister of Customs, Hon. William Patterson; Minister of Inland Revenue, Sir Henri Joly de Lotbinière; without portfolio, Hon. R. R. Dobbell and Hon. C. A. Geoffrion.

The only important change during the year was the retirement of Sir Oliver Mowat from the Department of Justice and his acceptance of the lieutenant governorship of Ontario. The second session of the Eighth Parliament was opened in state by the Governor General on March 25, 1897. The speech from the throne outlined the policy of the party in power. The following are its significant passages:

"Immediately after the last session the Government of Manitoba was invited to hold a conference with my ministers on the subject of the grievances arising out of the act of that province relating to education, passed in 1890. In response to that invitation three members of the Manitoba Government came to Ottawa, and after many and protracted discussions a settlement was reached between the two governments, which was the best arrangement obtainable.

"A measure will be submitted to you for the revision of the tariff, which it is believed will provide the necessary revenue, and, while having due regard to industrial interests, will make our fiscal system more satisfactory to the masses of the people.

"You will be asked to give your support to a bill abolishing the present expensive and unsatisfactory franchise act, and adopting, for the election of members of the House of Commons, the franchises of the several provinces.

"My Government has determined that the advantages to accrue, both to our western producers and the business interests of the whole Dominion, from the completion of the works for the enlargement of the St. Lawrence canals, should no longer be deferred, and has, subject to the approval of Parliament, taken the initial steps for a vigorous prosecution of those works, and for the perfecting of the canal system by the close of 1898.

"Arrangements have been completed which, if you approve, will enable the Intercolonial Railway system to reach Montreal, and thus share in the large traffic centering in that city. Appreciating the difficulties encountered by our farmers in placing their perishable food products on the English market in good condition, my Government has arranged a complete system of cold-storage accommodation at creameries, on railways, at ports, and on steamers, by which these products can be preserved at the desired temperature during the whole journey from the point of production to Great Britain.

"It is desirable that the mind of the people of Canada should be clearly ascertained on the subject of prohibition, and a measure enabling the electors

to vote upon the question will be submitted for your approval.

"I regret that the reports from the ordinary sources continue to be inadequate to meet the charges against the consolidated revenue. The proposed revision of the tariff and the application of strict economy in the administration of the Government will, I trust, restore the equilibrium between income and expenditure.

Of the measures mentioned, several of the most important were presented and discussed, but were ultimately withdrawn in order to facilitate the Premier's attendance at the jubilee in London. The Drummond railway bill, which proposed the purchase of a short line connecting Montreal with the Intercolonial Railway from Halifax, was the subject of active party hostility and severe criticism. Charges of corruption were freely made, and the Senate finally refused to ratify it unless a committee was appointed to investigate the whole matter. This compromise was accepted by the Government, and the measure went through. An arrangement was entered into with the Peterson Company, of London, to establish a fast Atlantic steamship line, with a Canadian subvention of \$200,000 annually. An alien labor act was passed, modeled precisely after that of the United States, but made enforceable only at the will of the Government as to time and place. The Comptrollers of Inland Revenue and Customs were raised to the rank of members of the Cabinet. The Northwest Territories were given complete provincial self-government. Arrangements were made for the regulation and registration of cheese factories, and the provision of cold-storage transportation facilities. A loan of \$15,000,000 was authorized, in order to pay for railway and other schemes, and the Government was given power to pay bounties upon iron and steel, and to levy export duties on logs and minerals. There was a good deal of private legislation connected with railway charters and projects, which was made subject to a railway commission which it was proposed by the Government to organize hereafter.

But the most important event of the session was the new tariff. It was introduced by Mr. Fielding in a long budget speech on April 22. He began with a summary of the financial position from the time of the late Government. The changes announced were unimportant in detail, but not in principle. They practically pledged the Government to do nothing injurious to vested interests or inimical to the maintenance of the protective tariff. Duties on iron were reduced considerably, to help the implement manufacturers in their competition with the American finished product, while bounties were given the iron smelters as a set-off to this reduction. On spirits and tobacco the excise and import duties were made very much heavier. Cigarettes were especially affected. In food products little change was made except in flour and sugar, upon which the duties were lowered one half. The duty on coal oil was reduced, and that on bituminous coal was maintained at 60 cents a ton, anthracite being free. It was promised, however, that if the United States Government would lower its duty to 40 cents (the Dingley bill was then pending) Canada would do the same. But the most important point in the tariff schedule, which was a great surprise to the country, was the enactment that when the customs tariff of any other country is made favorable to Canada the duties upon the products of that country shall at once be lowered one eighth, and after July 1, 1898, one quarter. This was at once made applicable to Great Britain and created a most favorable impression in the mother country.

Unfortunately, however, it was discovered that, under terms of special treaties with the German Zollverein and with Belgium, the goods of those countries would have to be admitted on the same terms given to England. As a result of Canadian pressure and partly as a consequence of the imperial spirit manifested during the jubilee year, the British Government a few months later gave to Germany and Belgium the necessary notice of its intention to abrogate the treaties. On the whole, the budget was well received, and the policy became popular. Mr. Fielding concluded his speech with the following review:

"We submit a tariff which largely abandons the specific duties that have been so unjust to the poorer classes. We submit a tariff in which the large free list is not practically disturbed, but has large additions made to it. We give to the country the great boon of free corn, which will have an important effect on the development of our farming interests, and particularly of the dairying interest. We give to the country a reduction of the duty on coal oil, and the removal of the burdensome restrictions respecting the sale of coal oil. We give to the farmer his fence wire at a low rate of duty for the present year, and place it on the free list from Jan. 1 next. We give him his binder twine on the same terms, a lower rate of duty for the present, and make it free from Jan. 1 next. We put all surgical and dental instruments on the free list. We recognize the great mining industry of the country by placing on the free list all machinery exclusively used in mining enterprises. We give the people the benefit of reductions on breadstuffs, flour, wheat, and cornmeal. We give the manufacturers the benefit of cheaper iron. We provide the necessary revenue, but protect to meet the great needs of the country by increased taxes on articles of luxury. And last, but not least, we give to the people the benefits of preferential trade with the mother country."

Postal Service.—The 9,103 post offices in the Dominion in 1896 were used for the transmission of 116,028,000 letters, 24,794,800 post cards, 3,505,500 registered letters, 4,803,800 free letters, 24,024,000 newspapers, periodicals, and circulars, 2,352,000 packages of printers' copy, deeds, policies, etc., 1,320,700 packages of merchandise, 331,700 parcels, post packages, 22,630 closed parcels for the United Kingdom. The mails were carried over 1,669 miles of railway, an increase of 206 miles over 1895. There has been a very great increase in the amount of correspondence between Canada and China and Japan; 229,738 letters went to these countries, an increase of 49,745 compared with 1895.

Finance.—The financial arrangements of the fiscal year 1896-'97 did not pass without severe criticism. The expenditure was \$1,162,521 more than that of the previous year on current account, the deficit was \$525,739, and the addition to the net debt of the country was \$2,794,000. The following were the figures:

RECEIPTS.	1896.	1897.
Customs	\$19,833,279	\$19,478,236
Excise	7,926,005	9,170,765
Post office	2,962,014	3,226,482
Public works and railways	3,594,274	3,570,571
Miscellaneous	2,993,025	2,993,291
Totals	\$36,611,597	\$37,469,347
Current expenditure	36,949,142	38,325,086
Current deficit	338,545	525,739

The expenditure on capital account for the year ended June 30, 1897, was \$3,705,611.

In most of the current services there was an increase of expenditure, although the defense was that this included payment of debts of the late ad-

ministration. During the session annual payments were pledged by the Government to the extent of \$1,055,000—for the Atlantic service, the Crow's Nest Railway, the intercolonial extension, the deepening of the canals, etc. In October, 1897, Mr. Fielding went to London and placed a loan of £2,000,000. The issue price was 91, which made the bonds yield about 2½ per cent. The whole loan was taken up at once, more than half of it by Canadian banks and investors. Half the amount was to pay off floating indebtedness.

The estimates for 1897-'98 included a total expenditure of \$44,607,238. In this were two items of \$5,000 each for statues, opposite the Parliament buildings, to the Queen and the late Alexander Mackenzie.

Elections.—During the year several by-elections were held, which (as usual in Canada) went with the Government. Winnipeg, St. Boniface, and Macdonald, in Manitoba, a constituency in Prince Edward's island, Colechester in Nova Scotia, Champlain and Bonaventure in Quebec, and Centre Toronto in Ontario, seemed to indicate that the tide still ran strongly with the Liberals.

The Manitoba School Question.—This vexed problem was settled for the time being. Mr. Laurier, the French Catholic Liberal Premier of the Dominion, went into consultation with the English Protestant Premier of Manitoba, and the two governments evolved the following agreement:

"Legislation shall be introduced and passed at the next regular session of the Legislature of Manitoba embodying the provisions hereinafter set forth in amendment to the public schools act, for the purpose of settling the educational questions that have been in dispute in that province. Religious teaching to be conducted as hereinafter provided: 1. If authorized by resolution passed by a majority of the school trustees; or 2. If a petition be presented to the board of school trustees asking for religious teaching, signed by the parents or guardians of at least 10 children attending the school, in the case of a rural school district, or by the parents or guardians of at least 25 children attending the school in a city, town, or village. 3. Such religious teaching to take place between the hours of 3.30 and 4 o'clock in the afternoon, and to be conducted by any Christian clergyman whose charge includes any portion of the school district, or by a person duly authorized by such clergyman, or by the teacher when so authorized. 4. Where so specified in such resolution of the trustees, or where so required by the petition of the parents or guardians, religious teaching during the prescribed period may take place only on certain specified days of the week, instead of on every teaching day. 5. In any school in towns and cities where the average attendance of Roman Catholic children is 40 or upward, and in villages and rural districts where the average attendance of such children is 25 or upward, the trustees shall, if required by the petition of the parents or guardians of such number of Roman Catholic children respectively, employ at least 1 duly certified Roman Catholic teacher in such school. In any school in towns and cities where the average attendance of non-Roman Catholic children is 40 or upward, and in villages and rural districts where the average attendance of such children is 25 or upward, the trustees shall, if required by the petition of the parents or guardians of such children, employ at least 1 duly certificated non-Roman Catholic teacher. 6. Where religious teaching is required to be carried on in any school in pursuance of the foregoing provisions, and there are Roman Catholic children and non-Roman Catholic children attending such school, and the schoolroom accommodation does not permit of the pupils being placed in

separate rooms for the purposes of religious teaching, provision shall be made by regulations of the Department of Education (which regulations the Board of School Trustees shall observe) whereby the time allotted for religious teaching shall be divided in such a way that religious teaching of Roman Catholic children shall be carried on during the prescribed period on half of the teaching days in each month, and the religious teaching of the non-Roman Catholic children may be carried on during the prescribed period on half of the teaching days of each month. 7. The Department of Education shall have the power to make regulations not inconsistent with the principles of this act for carrying into effect the provisions of this act. 8. No separation of the pupils by religious denominations shall take place during the secular work. 9. Where the schoolroom accommodation at the disposal of the trustees permits, instead of allotting different days of the week to the different denominations for the purpose of religious teaching, the pupils may be separated when the hour for religious teaching arrives, and placed in separate rooms. 10. When 10 of the pupils in any school speak the French language (or any language other than English) as their native language, the teaching of such pupils shall be conducted in French (or such other language) and English, upon the bilingual system. 11. No pupils to be permitted to be present at any religious teaching unless the parents or guardians of such pupils desire it. In case the parents or guardians do not desire the attendance of the pupils at such religious teaching, then the pupils shall be dismissed before the exercises, or shall remain in another room."

The next point was to obtain acceptance of the compromise by the clergy and hierarchy of Quebec and Manitoba. Archbishop Langevin, of Winnipeg, at once denounced the whole affair, and so did other prelates. Hence a petition was sent to the Pope, signed by Messrs. Laurier, Tarte, Fitzpatrick, Scott, and Geoffrien, members of the Government, and by the Speaker of the Senate and 36 other members of Parliament. Its essential passages were these:

"Your Holiness has already been made aware of the conduct and attitude of certain prelates and of certain members of the secular clergy, who, during the general elections in this country, in the month of June last, intervened in a violent manner in restraint of electoral freedom, taking sides openly for the Conservative party against the Liberal party and going so far as to declare guilty of grievous sin those of the electors who would vote for the candidates of the Liberal party.

"We respectfully represent to your Holiness that these democratic institutions, under which we live and for which your Holiness has many times expressed sentiments of admiration and confidence, can only exist under a perfect electoral freedom. Far be it from us to refuse to the clergy the plenitude of civil and political rights. The priest is a citizen, and we would not for a single instant deprive him of the right of expressing his opinion on any matter submitted to the electorate; but when the exercise of that right develops into violence, and when that violence in the name of religion goes to the extent of making a grievous sin out of a purely political act, there is an abuse of authority of which the consequences can not but be fatal not only to constitutional liberty, but to religion itself.

"An active and violent intervention of the clergy in the domain of political questions submitted to the people must of necessity produce among the great mass of the Catholic population a degree of irritation manifestly prejudicial to that respect which religion and its ministers should ever inspire and command. Some twenty years ago his Holiness

Pius IX, your illustrious and lamented predecessor of the pontifical throne, acting through the Sacred Congregation of the Propaganda, deemed it his duty to put a stop to certain abuses of a similar character, and forbade the intervention of the clergy in politics. This prohibition was generally respected so long as his Eminence Cardinal Lascurain was able to guide the Church in Canada, but since old age and infirmities have paralyzed his guiding hand the abuses to which your illustrious predecessor had put a stop have begun again, and threaten once more to create trouble among us and to engender not only Catholic interests in this country and the peace and harmony which should exist between the various elements of our population.

"We beg that your Holiness will renew in our behalf the most wise prescriptions and prohibitions of your predecessor, protect the consciences of the Catholic electors, and thus secure peace in our country by the union of religion and liberty."

The result of this step was the appointment of Monseigneur Merry del Val as a papal delegate to inquire into the whole matter. He made a tour of the Dominion, held meetings of the archbishops and bishops of the Church of Rome in Canada, communed with party leaders of all kinds, and returned at the end of two months to submit his report to the Pope. This had not been made public at the end of 1897.

Militia.—The report of the Minister of Militia and Defense, submitted to Parliament April 13, dealt with the arming of the militia with new Lee-Enfield rifles and the erection of important new armories in Toronto, Kingston, and Halifax. It included Gen. Gascoigne's report as commander of the militia, in which he insisted upon the necessity of an annual training for the whole force, urged the rearming of the field batteries, the strengthening of the fortifications at Quebec, and the general reorganization of the forces.

Important changes regarding commanding officers and honorary appointments in the militia were promulgated in general orders. Provision was made for the retirement of commanding officers after five years' service, and for the appointment of honorary lieutenant colonels and chaplains. The regulations regarding commanding officers are amended to provide that all appointments as commanding officers are for five years. Any extension of tenure will be for three years, and will only be granted on the recommendation of the district officer commanding.

By these regulations seventy colonels were retired at one sweep. On June 30, the permanent militia (or regular troops) numbered 862, and the active militia 30,085. The expenditure for the year ending June 30, 1896, was \$2,136,713.

Insurance.—The premiums received by fire companies in 1896 were \$7,079,704, and the losses paid were \$4,157,154. The risks taken by Canadian companies were \$114,379,430; by British companies, \$459,959,398; and by American companies, \$303,175,556. The life insurance effected in this year by Canadian companies was \$195,317,542; by British companies, \$34,888,914; and by American companies, \$97,658,009. The premiums were respectively \$6,075,454, \$1,138,206, and \$3,380,917. Accident insurance was taken out to the amount of \$81,668,828, with premiums of \$419,629 and losses paid of \$231,903. Guarantee insurance was effected to the amount of \$13,542,175, with premiums of \$69,054, and losses paid of \$12,809.

Criminal Statistics.—Particulars are given by the Minister of Justice in his report for the year ending June 30, 1896. The total permanent population was as follows: Kingston, 666; St. Vincent de Paul, 383; Dorchester, 192; Montreal, 80; British Columbia, 101; total, 1,361.

The increase during the year was 6.5 per cent., and in the past two years more than 10 per cent. The record of pardons during the past three years was 49 in 1893-94, 73 in 1894-95, and 52 in 1895-96.

Fifty per cent. of the sentences are for terms of less than five years. Life sentences constitute 4 per cent. Of the total number of prisoners, 126 were under twenty years, 625 between twenty and thirty, 348 between thirty and forty, 161 between forty and fifty, 81 between fifty and sixty, and 20 over sixty. The proportion of convicts of the various large religious denominations was: Roman Catholics, 47.25 per cent.; Church of England, 21.17 per cent.; Methodists, 14.63 per cent.; Presbyterians, 8.23 per cent.; Baptists, 5.36 per cent.; Buddhists, 1.03 per cent. Of the total number of convicts, 937 were natives of Canada, 136 of the United States, 132 of England, 57 of Ireland, and 34 of Scotland. There were 122 total abstainers, 706 temperate persons, and 533 intemperate in the penitentiaries. Although many of the convicts were colored, Indian, or Chinese, only 235 of them could not read, while 1,046 could both read and write. The net cost of the penitentiaries was \$292,286 in 1895-96, compared with \$344,559 in 1894-95. The cost *per capita* was reduced from \$269.82 to \$222.44.

Trade and Commerce.—The trade of Canada for the fiscal year ending June 30, 1897, showed a marked expansion. In 1896 the exports were \$118,140,000, and the imports \$110,588,100. In 1897 they were respectively \$133,621,000 and \$111,731,000. The following is the classification of the exports:

ARTICLES	1896.	1897.
Minerals.....	\$8,401,760	\$11,563,359
Fish.....	11,193,698	10,623,328
Animals and products.....	37,404,396	40,280,584
Forest.....	27,324,894	31,500,063
Agricultural.....	17,974,191	25,809,594
Manufactures.....	10,222,877	10,169,167
Miscellaneous.....	473,854	673,034
Coin and bullion.....	4,699,309	3,478,940
Total.....	\$117,684,799	\$134,113,979
Product of Canada.....	106,586,284	120,156,771

Of the products of the mine, \$175,512 went to Great Britain and \$7,482,984 to the United States; of the fisheries, \$4,462,000 went to Great Britain and \$3,501,671 to the United States; of the forests, \$12,081,253 went to Great Britain and \$15,516,961 to the United States. Of animals and their products, \$32,488,801 went to Great Britain and \$3,385,261 to the United States. Of miscellaneous farm produce, \$9,551,011 went to Great Britain and \$3,242,632 to the United States. The total export was \$58,695,579 to Great Britain and \$31,129,509 to the United States.

Mineral Development.—The central feature of the year in a material sense was the rush to the Klondike and the stories of immense gold discoveries there and on the Peace river. Meanwhile, gold was being steadily produced in British Columbia and in the gold mines of Ontario and Nova Scotia. The great Yukon district of Canada, which borders upon the Yukon district in Alaska, contains the Klondike region and most of the gold so far discovered. During the year the Dominion Government made every possible arrangement for administering the newly populated regions under its control. Regulations were made as to mining which were very liberal to the Americans who were flocking into the region, as they placed the latter upon exactly a level with Canadians, and gave them the right to take the gold away to a foreign country. Major Walsh, of the Northwest Mounted Police, was appointed Administrator of the Territory, and with him went

Judge McGuire as magistrate. In October Mr. Sifton, Minister of the Interior, visited the Yukon in his official capacity, and made further arrangements for the management of those who might settle there. Mr. William Ogilvie, who has spent some years in the region prospecting and investigating for the Dominion Geological Survey, made his official report during the summer, and declared that there was \$77,000,000 worth of gold in sight.

Railways.—The report of the Grand Trunk Railway for the half year ending Dec. 31, 1896, was most satisfactory; it showed a surplus of \$489,957. The net deficit of its two American systems—Chicago and Grand Trunk, and Detroit, Grand Haven and Milwaukee—amounted, however, to \$870,114 for the half year. The half year showed a decrease of 170,765, or 5.09 per cent., in the number of passengers carried compared with the corresponding half of 1895, and a decrease of £233,182, or 5.11 per cent., in the receipts under that head. There was, however, an increase in the mail and express receipts, so that the net decrease in the receipts from passenger trains was \$104,468. It was in the freight and live-stock traffic the advance was made. The total traffic for the half year was 4,725,368 tons, an increase of 239,114 tons compared with the traffic of the corresponding half of the previous year. The receipts from this branch of the traffic for the half year showed an increase of £126,973, or 10.37 per cent., compared with the figures for the December half of 1895. The ratio of working expenses to gross receipts has been reduced from 72.57 per cent. to 70.3 per cent., and the working expenses per train mile have been reduced 6.3 per cent. The American branches operated by the Grand Trunk Company are still a heavy drain on the road's yearly returns, but the year 1896 showed an improvement.

The annual meeting of the Canadian Pacific Railway Company was held in Montreal on April 7. Sir William Van Horne declared the property of the road to be in an excellent condition, and that there was an increase of \$345,000 in the gross revenue.

The question of building the Crow's Nest line by private initiative with Government aid, by the Canadian Pacific Railway alone or with Government help, or as a distinct Government road, caused wide and bitter discussion. Finally a compromise was effected by which the Canadian Pacific Railway was to build the road as a part of its own system, but subject to certain defined rates, and in return for Government help was to lower its rates for transportation of Western grain to the seaboard.

The position of the Intercolonial was also a subject of much discussion in connection with a proposed bridge across the St. Lawrence at Montreal, and the purchase of the Drummond Railway as a branch line connecting it with Montreal from Quebec. At the end of 1896 the mileage of the Canadian Pacific Railway was 6,216, the Grand Trunk Railway 3,161, and the Intercolonial 1,360. The total mileage of Canadian railways was 16,387. The total number of passengers carried during the year was 14,810,407, an increase of 800,000; the tons of freight were 24,266,825, an increase of 2,700,000; the earnings were \$50,545,569, an increase of \$3,800,000; the working expenses were \$35,042,655, an increase of \$2,300,000. The total capital of private lines was \$840,800,290, and that of Government lines \$59,017,610. The Canadian Pacific in 1896 carried 3,036,619 passengers and 4,576,632 tons of freight; the Grand Trunk, 5,077,671 passengers and 7,587,148 tons of freight; the Intercolonial, 1,594,452 passengers and 1,426,013 tons of freight. The receipts of the first were \$20,175,385, and expenses \$12,202,360; of the second, \$16,506,878 and \$11,544,625; of the third, \$3,104,117 and \$3,237,966.

Marine and Fisheries.—The report of the marine section of this department up to Jan. 1, 1897, shows that the amount voted by Parliament for marine was \$835,640, and the expenditure for the fiscal year was \$43,326 less than the amount voted. The number of persons employed by the marine branch of the department in the outside service was 1,736. The number of lights in the Dominion is 766, against 625 ten years ago. The expenditure for maintenance and repairs of the Dominion steamers was \$150,599. The total number of wrecks and casualties during the year of British and Canadian seagoing vessels reported to the department was 273, with a loss of \$1,266,761. The number of lives reported lost was 43. The registered merchant shipping on Dec. 31, 1896, was 7,279 vessels, measuring 789,299 tons, being an increase of 17 vessels and a decrease of 36,537 tons compared with 1895. Assuming the average value to be \$30 a ton, the value of the registered tonnage of Canada would be \$23,678,000. During the year 227 new vessels were built and registered, of a value of \$726,000, estimating the tonnage at \$45 a ton.

The fisheries report was submitted on May 27, and was not satisfactory in many respects. While the salt-water inshore area of Canada, not including minor indentations, covers more than 1,500 square miles, the fresh-water area of that part of the Great Lakes belonging to the Dominion is computed at 72,700 square miles, not including the numerous lakes of Manitoba and the Territories, all stocked with excellent fish. For 1896 the value of the Canadian fisheries was computed at \$20,199,338, being a decrease of over \$500,000 compared with the previous year.

With the exception of British Columbia, which shows a surplus of nearly \$500,000, and New Brunswick, which shows a slight increase, all the provinces have yielded less than last year. The figures above do not include the large quantity of fish consumed by the Indian population of British Columbia and the Northwest Territories, estimated at over \$2,000,000.

For the first time in the history of Canadian fisheries salmon, an anadromous fish, has supplanted in the graduated table his deep-sea cousin, the cod. While the value of the latter has declined by over \$500,000, the value of the former has increased by about the same amount, thus reversing the difference of \$1,000,000 which existed in 1894 between the two species. Other most important fluctuations are the large increase in herring and sardines, and the falling off in mackerel and lobsters.

CANNING INDUSTRY. About \$72,000,000 worth of canned goods are put up annually by the canneries of the United States, about one third of this value being in meats, and the remainder in fruits and vegetables. The annual output in cans of all sizes is about 700,000,000, and in ear-lids about 60,000. There are about 2,000 canned-goods-packing firms in the country, and a little more than 2,000 canneries. Maryland is the center of the industry, about 500 canneries being within that State; Maine, New York, and California, in the order named, are the States next most productive of canned goods, but there is hardly a State in the Union that has not some share in the industry. Ohio, Illinois, Virginia, and Indiana are largely represented. During the busy season employment is given to about 1,000,000 persons, directly and indirectly. The number regularly employed is fewer than 70,000.

The history of the industry begins about 1850, when the introduction of machinery began to supplant the hand labor that had been employed in a small way. Shortly after the civil war the Ferracute Machine Company, of Bridgeton, N. J., and

other concerns began the manufacture of presses, dies, and fruit-can tools, and soon then a long line of labor-saving machinery has been developed. The organization of members of the trade for their own protection began in 1882, with the formation of the Canned Goods Exchange, in Baltimore. In 1885 the Western Canned Goods Packers' Association was formed in Chicago. As a result of this came the National Association of Canned Goods Packers organized in Indianapolis in 1890; the Pennsylvania Packers' Association was formed at Dover, Pa., in 1894; and the Atlantic States Canned Goods Packers' Association at Baltimore in the same year.

The list of edibles canned includes nearly every perishable food product, being headed by tomatoes, which is the staple in Maryland and the Middle States. Beef is canned mostly north and west of Ohio river. Sardines and lobsters are the principal features of the pack in Maine, while salmon is put up mostly in California, and oysters in New Jersey, Delaware, and New York. About 3,000 fishing vessels and 25,000 fishermen find employment in supplying the canneries, while 2,000 oyster boats and 20,000 men are engaged in raising oysters for the same purpose. Peas are packed largely in Maryland, New York, Ohio, Indiana, and Delaware. Massachusetts is the State where the most beans are packed, New York being a close second. Corn, milk, apples, pears, pineapples, small fruits generally, pumpkins, squashes, etc., are put up in large quantities wherever they are plentifully grown.

About \$30,000,000 of capital is invested in the canning industry in the United States, and about \$12,000,000 is paid out annually in wages. The raw material costs about \$40,000,000. Almost all the goods packed are for domestic consumption, though the export trade is increasing, the canned-fruit export for 1896 being \$1,346,381, against \$871,465 the previous year. The canned-meat export is known to be larger than that of the fruit, but the exact figures are not obtainable, owing to the method of classification of the exports. Great Britain takes the greater part of the export. Canners engaged in packing fruit and vegetables are obliged to do most of their work during a few months of the summer, being comparatively idle the remainder of the year. They generally engage all the floating cheap labor in the vicinity during their busy months, paying from \$2.50 to \$1 a day in wages, a great deal of the work being done by women and children, who are paid by the piece.

A large portion of the tin plate produced in the country is used in making cans, and many of the tin-plate concerns are also manufacturers of cans. The cans are mostly round, though square and oblong cans are common. All the work is done with automatic machinery, the tin being stamped out with presses and dies, and put together with seamers and headers. For many years it was necessary to use hand labor for sealing or closing up the cans after filling, but a practical mechanical capper was introduced about 1883, and there are now several capping machines in the market. An efficient capper will solder 40,000 cans in a day.

The machinery of a canning factory devoted to fruit and vegetables includes usually a steam boiler for heating a water bath, this being connected by pipes with various tanks and kettles used in scalding and blanching. Scalding assists the skinning operation, and tomatoes or the like, held in wire baskets, are dipped in the kettles just before skinning. Cookers are made in a great variety of forms, according to the nature of the goods and the capacity required. They usually have a screw as an attachment, for supplying a definite amount of sirup to each can, and frequently an automatic can-filling attachment constitutes a part of the

most common. A double-filler cooker, with stirrer, should have a capacity of about 5,000 cans an hour. Process kettles or tanks are used in "processing" or cooling the fruit. Exhaust tanks and kettles are employed to exhaust cold air from the cans just before the final closure. Crates, formed of strap iron and arranged to be hung from cranes, are used for handling the cans in the operations of processing, exhausting, etc. For special work there are such machines as green-corn cutters, which will handle 4,000 ears an hour; corn mixers; corn-silking machines, for removing silk and refuse from the corn after its separation from the cob; pea-hulling machines, some of which will hull 100 bushels in an hour; rotary pea-separators, grading the peas into half a dozen sizes, at the rate of 60 bushels an hour; pea sieves, for grading peas in small quantities; pea blanchers; pumpkin fillers; pumpkin-crates; pumpkin peelers; besides various wipers, papers, rollers, graters, seeders, etc.

CAPE COLONY AND SOUTH AFRICA. The Cape of Good Hope was settled by the Dutch in the seventeenth century. In 1806 the colony was annexed by Great Britain. It then extended eastward as far as the Great Fish river. Many of the descendants of the original Dutch and Huguenot settlers, dissatisfied with British rule, founded a new colony in Natal, on the east coast, in 1835. Other discontented Boers migrated northward across the Orange river in 1836 and succeeding years and established the settlements that were declared independent and organized into the Orange Free State in 1854. The Natal settlements were annexed by Great Britain, and the Boer colonists abandoned their farms and traveled far into the interior, where they established, in 1849, on the farther side of the Vaal river, a new commonwealth called the Transvaal Republic, whose independence was recognized by Great Britain in 1852. Natal was separated from Cape Colony and erected into a colony in 1856. British Kaffraria was incorporated in Cape Colony in 1865, and Tembuland, East Griqualand, the Transkei territories, and the harbor of Walvisch Bay, on the southwest coast, were annexed subsequently. Griqualand West was originally a part of the Orange Free State, but after the discovery of the diamond mines it was annexed by Great Britain, and now forms an integral part of Cape Colony. Basutoland was annexed to Cape Colony in 1871, but was detached in consequence of difficulties with the natives, and was placed under direct British imperial administration in 1884. In 1884 Germany declared a protectorate on the southwest coast of Africa over Damarraland from Cape Frio, the southernmost point of Portuguese West Africa, to Walvisch Bay and over Namaqualand from Walvisch Bay to the Orange river. British Bechuanaland was annexed by Great Britain in 1884 after the suppression of the Government established in Stellaland at Vryburg by Transvaal Boers, and in 1885 a British protectorate was proclaimed over independent Bechuanaland, the country still ruled by Chief Khama. Zululand was divided after the Zulu war, a section next to the Natal border being set apart as a reserve for loyal Zulus who aided the British in the war. The rest was restored to Cetewayo in 1883. In 1887 about two thirds of this territory, together with the Zulu reserve, were formally declared British territory and were placed under the administration of the Governor of Natal. The Transvaal Republic was annexed by Great Britain in 1877, and a British administrator was appointed, but in 1880 the Boers took up arms after expelling the British officials, and after successfully resisting the British troops that were sent to conquer them obtained by the treaty of 1881 the restoration of self-government in

internal affairs, the control of external affairs being reserved to the British Government under the title of suzerain. A subsequent convention, signed at London in 1884, recognized the new style of South African Republic adopted by the Transvaal and abandoned the assertion of suzerainty, but reserved to Great Britain the right to review and reject any treaty made by the Government of the republic with foreign powers or with independent native chiefs to the north or east of the Transvaal. The new republic, founded by Boers in Zululand, was subsequently incorporated as the district of Vrijheid in the South African Republic with the assent of Great Britain. By the convention of 1890 a part of Swaziland also was added to the republic. All the territories north of the Transvaal, including Matabeleland, ruled by King Lobengula, with the neighboring countries of the Mashonas, Makalakas, and other tribes paying tribute to him, and comprising all the region north of 22° of south latitude, east of 20° of east longitude, and west of the Portuguese province of Sofala, were declared to be within the British sphere of influence. In 1889 a royal charter was granted to the British South Africa Company, which was authorized to organize an administration for these territories. The company was empowered to take under its administration, subject to the approval of the Imperial Government, the regions north of the Bechuanaland protectorate, and west of it to the German boundary. Portugal claimed the banks of the Zambesi and a continuous zone of territory across the continent from its colony of Mozambique, on the east coast, to Angola, on the west coast, but, yielding under threat of war to superior force, agreed in 1891 to recognize as a British protectorate the countries south of the Zambesi, including the Manica plateau, and also the Barotse kingdom and all the regions north of the Zambesi up to the border of the Congo State, including the Lake Nyassa region, where British missionaries were active. In 1891 the British Government extended the field of operations of the British South Africa Company so as to include all the territories north of the Zambesi, known as Northern Zambesia or British Central Africa, with the exception of the Nyassaland districts, which had been declared in 1889 to be within the British sphere, and were now proclaimed a British protectorate. Pondoland was annexed to the Cape in 1894, and in 1895 the Crown colony of Bechuanaland was incorporated in Cape Colony.

Cape of Good Hope.—Cape Colony has possessed responsible government since 1872. The legislative power is vested in a Legislative Council, elected for seven years and containing 23 members, and a Legislative Assembly of 79 members, elected for five years. The colony is divided into 7 districts, each electing 3 members to the Council, while Griqualand West and British Bechuanaland are each represented by 1 member. Members of the Assembly are elected by single country districts and towns. The members of both houses are elected by voters able to register their names, occupations, and addresses and qualified by the occupation of house property worth £75 or the receipt of a salary of £50. The law of 1892 provided that elections should be held by ballot after July 1, 1894. The number of registered electors in 1895 was 91,875.

The Governor is Lord Rosmead, formerly Sir Hercules Robinson, who was Governor before from 1881 till 1889, and was reappointed in 1895. The ministry in the beginning of 1897 was composed as follows: Prime Minister and Treasurer, Sir J. Gordon Sprigg; Colonial Secretary, Dr. T. N. G. Te Water; Attorney-General, Sir Thomas Uppington; Commissioner of Public Works, Sir James Sivewright; Secretary for Agriculture, P. H. Faure.

Area and Population.—The area of Cape Colony, with Griqualand West and British Bechuanaland, is 248,187 square miles, and the population in 1891 was 1,112,596, of whom 371,819 were whites. The area of the dependencies of the colony is about 16,000 square miles, and the population 690,000, of whom 10,379 are whites. The population of Cape Town, the capital, was 83,718 in 1891, including suburbs. There were 7,356 marriages in 1895. The net immigration in 1892 was 4,788; in 1893, 7,005; in 1894, 7,845; in 1895, 15,410. The Government granted £181,371 in aid of education in 1895. Of 90,280 European children returned in the census, 22,080 were taught in Government-aided schools, 17,697 in private schools, and 20,223 at home or in Sunday schools only; of 316,152 native children, 34,133 were taught in Government-aided schools, 4,561 in private schools, and 5,021 at home or in Sunday schools. There were 2,200 aided schools and colleges in 1895, with 106,683 pupils enrolled, and 78,021 in average attendance. Only 28 per cent. of the European population could read and write in 1891.

Finances.—The revenue of the colony for the year ending June 30, 1895, was £5,416,612, of which £1,902,860 came from taxation, £3,069,567 from services, £337,272 from the colonial estate, £80,472 from fines, stores, etc., and £26,441 from loans. The total expenditure was £5,388,157, of which £1,244,749 went to pay interest and sinking fund of the debt, £1,552,445 for railroads, £158,584 for defense, £317,913 for police and jails, £140,448 for the civil establishment, and £236,423 under loan acts. The budget of expenditures for 1897 is £5,827,662.

The debt of the colony on Jan. 1, 1896, amounted to £27,533,978. The debts of the divisional councils amounted to £43,949, and those of municipalities to £1,411,143. The municipal revenues were £437,629 in 1895, and the expenditures £596,048.

Commerce and Production.—The product of wheat in the year ending May 31, 1896, was 2,187,648 bushels; of oats, 1,654,503 bushels; of barley, 668,400 bushels; of mealies, 1,728,231 bushels; of Kaffir corn, 1,009,503 bushels; of rye, 607,536 bushels; of tobacco, 4,579,759 pounds; of wine, 5,687,232 gallons; of brandy, 1,264,512 gallons; of raisins, 1,636,566 pounds; of wool, 45,521,508 pounds; of mohair, 7,210,915 pounds; of ostrich feathers, 294,479 pounds; of butter, 3,204,440 pounds. There were 387,590 horses, 94,570 mules and asses, 2,303,582 cattle, 14,409,434 sheep, 4,939,258 goats, and 224,953 ostriches in the colony in 1896.

The total value of the imports in 1895 was £19,004,880. The merchandise imports amounted to £13,285,005. The total exports were £16,904,756 in value, the exports of colonial produce, £16,798,137. The imports of textiles and apparel were £4,080,865; of food and drink, £2,449,788. The exports of gold were £7,975,637, not including specie; of diamonds, £4,775,016; of wool, £1,695,920; of Angora hair, £710,867; of ostrich feathers, £527,742; of hides and skins, £475,398; of copper ore, £246,597; of wine, £20,289; of grain and meal, £9,565. Of the total imports, £10,427,201 came from Great Britain, £736,584 from British possessions, and £2,448,620 from foreign countries; of the exports, £16,316,001 went to Great Britain, £68,011 to British possessions, and £414,125 to foreign countries.

Navigation.—During 1895 there were 851 vessels, of 1,974,576 tons, entered in the ocean trade, of which 641, of 1,777,417 tons, were British; and there were cleared 810, of 1,905,500 tons, of which 617, of 1,735,027 tons, were British. In the coasting trade 1,167, of 3,141,932 tons were entered, and 1,170, of 3,153,895 tons, cleared.

The merchant marine of the colony in 1896 con-

sisted of 8 sailing vessels, of 508 tons, and 22 steamers, of 2,322 tons.

Communications.—The Government owns all the railroads except 205 miles. The Government railroads have been built since 1872 when there were only 63 miles. In 1895 they had a length of 1,089 miles, and on Jan. 1, 1896, the total length was 2,353 miles. The system extends into the South African Republic through the Orange Free State and from Kimberley northward to Mafeking, where the line is being continued for the British South Africa Company. The section from Vryburg to Mafeking, 96 miles, was also built for this company, and is operated for it by the Cape Government. The capital expended in the Government railroads to Jan. 1, 1896, was £20,487,072. The gross receipts for 1895 were £3,380,063, and the expenses \$1,590,013. There were transported during the year 6,703,088 passengers and 1,158,614 tons of freight.

The number of letters passing through the post office in 1895 was 16,600,576; of newspapers, 7,562,400; of postal cards, 518,560; of books and samples, 1,533,720; of parcels, 360,020; receipts, £331,637; expenditures of postal and telegraph service, £341,703. The receipts from telegrams were £97,453, not including Government messages worth £90,705 to dispatch at regular rates; expenses, £90,603. The telegraph lines have a length of 6,346 miles. The Government acquired from the telegraph company 781 miles in 1873, and has built the rest of the system. The number of dispatches in 1895 was 1,798,061.

Politics and Legislation.—Cape Colony has enjoyed great prosperity through the development of gold mining in the Transvaal and the influx of capital into South Africa and of a new population to consume its products. The depression of the gold-mining industry reacted on the commercial and agricultural interests of the Cape, and in 1897 the expansion received a sudden check. The imports at the South African ports in 1896 amounted to £36,000,000, and the exports to only £13,000,000. As capital ceased to flow in the balance could only be settled by shipments of specie, which began in the spring and continued at the rate of \$4,000,000 a year. The rinderpest, in spite of quarantine regulations, at last invaded the colony. The railroads still paid 84 per cent. in 1896, and the Government felt justified in extending the system. By an agreement with Mr. Rhodes, the Cape Government obtained the exclusive right to work all railroads in Rhodesia, with the exception of the Beira road, for three years, with the option of four years more. A railroad convention was concluded whereby the Orange Free State took over the lines built within its borders of the Cape Government.

In the Parliament, which began its session on April 2, bills were introduced to amend the mining laws, to encourage the development of the resources of the country, to promote public health, to amend the lunacy law, and to give greater responsibility to communities for the support of education and grant more liberal aid toward the maintenance of certain public schools. The customs union act was ratified. The seab act was extended to the Transkei, and opposition to the measure was diminishing throughout the colony.

On April 15 Mr. Du Toit, President of the Afrikaner Bond, moved a resolution deprecating war between European peoples, expressing the conviction that peace can best be attained by the faithful and reciprocal observance of all obligations under treaties and conventions, and suggesting that means should be devised to obtain a settlement of any differences arising as to the interpretation of those obligations, so that by the adoption of a policy of

moderation, mutual conciliation, and fairness the peace of South Africa might be secured. Mr. Rose-Inness, leader of the regular Opposition, presented as an amendment a moderate declaration of imperial policy and a demand for the redress of the grievances of the Uitlanders in the Transvaal. In the end the Bond resolution was adopted by 41 votes to 32, but with an amendment deprecating the intervention of any foreign powers in disputes between the Imperial Government and the South African Republic. In the Legislative Council this resolution in the interest of peace in South Africa and non-interference in the affairs of the Boer Republic was carried by a two-third majority. A few days later Mr. Merriman, representing the friends of the Transvaal Government, offered a motion of no confidence in the Government. Although Mr. Rose-Inness and 14 of his party now voted with the extreme Dutch party, most of his English followers supported the ministry, and 8 members of the Progressive Dutch party also stood by the Government. The result was a tie vote of 36 votes on each side, and the speaker gave his casting vote to retain the Government in office. Mr. Rose-Inness then resigned as leader of the Opposition, taking, with his immediate supporters, an independent position, while the Dutch party, which for years under Mr. Hofmeyr's lead, had been able to control legislation and dictate policies by giving or withholding its vote, became the regular Opposition under the leadership of Mr. Sauer. The Assembly resolved to limit the introduction of undesirable immigrants. A bill was carried giving licensing boards power to prohibit the sale of liquor to natives, but it was thrown out by the Legislative Council. The surplus revenue for the past year was £500,000, and for the coming one Sir J. Gordon Sprigg estimated a revenue of £6,715,000 and an expenditure of £6,488,000, leaving a surplus of £227,000. He asked that the whole surplus be reserved for the extinction of the rinderpest, which had already consumed £667,000. The cost of suppressing the Bechuanaland revolt was estimated at £95,000. A resolution was passed authorizing the Prime Minister, who was about to depart for England to represent the colony in the diamond jubilee, to take provisional steps to arrange some basis of contribution by the colony toward the imperial navy. Accordingly, Sir J. Gordon Sprigg offered the gift on the part of Cape Colony, subject to ratification by the Cape Assembly, of the cost of a first-class battle ship to be added to the British navy without conditions.

Basutoland.—The native territory of Basutoland, lying between Cape Colony, Natal, and the Orange Free State, has been administered by a Resident Commissioner under the direction of the High Commissioner for South Africa since March 13, 1884. The area is estimated at 10,293 square miles, and the population at 250,000. European settlement on the land is prohibited. There are 99 Europeans in Maseru, the chief town. The natives raise wool, wheat, meadles, and Kafir corn, and have many horses and cattle. The exports, consisting of grain, cattle, and wool, were valued at £139,500 in 1896. The revenue is derived from a hut tax of 10s., trading licenses, and the post office, and is supplemented by a contribution of £18,000 from Cape Colony. The whole amount was £45,653 in 1896, and the expenditures amounted to £42,970. The Resident Commissioner is G. Y. Langden.

Kafir Disturbances.—As soon as the Cape mounted rifles departed from Bechuanaland a body of armed and mounted natives collected at Umzimkulu and presented their demands to the magistrate. When the unruly chief at the head of the movement was arrested, the natives assembled at Kokstad to discuss a plan of action, while the whites

and trusty natives guarded the magazine, and a force of Cape mounted rifles was dispatched to the spot from the south. The threatened disturbance was thus averted. On June 21 the Cape Assembly passed a bill under which a disobedient chief or any dangerous white can be arrested by proclamation. The followers of Sigcau in Pondoland became restless and insubordinate, and in Basutoland serious troubles were threatened. Tribal quarrels had resulted in bloodshed, and the contending chiefs were accordingly summoned by the Resident Commissioner, Sir Godfrey Langden, to appear before him. One chief refused to attend, but ultimately appeared with an imposing cavalcade of followers.

Bechuanaland Protectorate.—The area of the Bechuanaland Protectorate is about 386,200 square miles. When British Bechuanaland was annexed to Cape Colony in November, 1895, new arrangements were made for the government of the protectorate. The chiefs Khama, Sebele, and Bathoen rule their respective tribes under the supervision of a resident commissioner. The chiefs receive the hut tax. Outside of the boundaries fixed for them the administration was committed to the British South Africa Company. The natives are peaceable and industrious, devoting themselves to agriculture and the rearing of cattle. The Resident Commissioner is F. J. Newton.

Native Rebellion.—The natives of the British Bechuanaland reserve, reduced to a deplorable condition by locust plagues, rinderpest, and other disasters, persuaded themselves, or were persuaded, as they afterward said, by a Boer intriguer named Bosman, who was, however, fully exculpated by his Government after an investigation, that the Cape Government intended to take their lands, which the annexation act of 1895 declared should not be alienated or in any way diverted from the purposes for which they were set apart. The forcible killing of their cattle, as a precaution against the spread of the rinderpest, they were led to believe was nothing but a device for wiping out the people. The relaxation of the liquor regulations and other actions tolerated by the Cape Government strengthened their suspicion that they were to be got rid of in order to hand over their lands to white settlers. Rendered desperate by distress and this belief in their impending doom, they began to plunder the outlying farms, and committed several murders, and soon the tribes concerned in these outrages found themselves in open rebellion against the Government. This movement spread till it involved about one seventh of the Bechuana nation. First, in December, 1896, the chief Galishwe, in the Taungs reserve of British Bechuanaland, revolted. His tribe numbered 2,000 fighting men, and against them were sent 165 Cape police, 384 mounted riflemen from Kimberley, and 400 Cape volunteers, while the burghers of the disturbed district defended themselves. Lukas Jantje's followers joined the rebels, who murdered several settlers and storekeepers. Molalla, who disputed the supremacy with Galishwe, offered his aid to the Government, while Tooti and the rest of the Batlaras tribe joined the rebellion and committed outrages southwest of Vryburg. These natives, who had never been troublesome before, were quickly defeated by a strong force of burghers and volunteers. The natives of East Griqualand also became restless, and the farmers throughout these regions placed their families in security and went into *laager*. A field force was organized at the Cape, but volunteers were not summoned from the eastern districts, for there also there was danger of native disaffection. Meanwhile Galishwe's following increased largely. The colonial force, numbering 1,067 men, advanced on his position in Langeberg, toward the end of March,

in three columns. Lukas Jantje's village of Gamasiap, at the foot of the mountains, was burned by Col. Dalgety's column, and the kraals of the whole district were destroyed and the natives driven into the mountains in order to starve the rebels into surrender. The rebel chief Toto's stronghold was captured on May 10. The rebels in the mountains were short of food, but they still held out. Galishwe's position was once surrounded, but he slipped out with his followers and escaped northward. In June a larger expedition was organized for the purpose of a simultaneous advance on the five *kloofs* in Langeberg held by Galishwe, Toto, and Lukas Jantje. The reinforcements consisted of 600 Cape volunteers, 400 of the Cape mounted rifles, and 400 natives. The burgher force of 500 men, operating with the troops already in the field, was disbanded as being unfit for this kind of warfare, some of them having fired on friendly natives. Active operations were not begun till late in July. The field force attacked Langeberg at all five points, the principal attack being on Galishwe's town. Gamasiap and Gamalane were taken. Lukas Jantje was killed, and Dokwe, his successor, surrendered. The commander of a corps from Cape Town was afterward punished for having the head of the chief Lukas Jantje cut off for the purpose of presenting the skull to a museum. Galishwe was wounded, but escaped. Twaai's *kloof*, to which the rebels retreated in confusion, was stormed on Aug. 1. Toto surrendered unconditionally. The mountain column, 1,000 strong, marched upon Pudu-hushe, the last stronghold in Langeberg, and found it deserted. Galishwe was captured after several weeks and placed on trial at Kimberley.

Sir Gordon Sprigg brought in a bill to confiscate the land of the rebellious Bechuannas and devote it to European occupation, collecting the natives into three locations small enough to enable the Government to keep them under supervision. The bill was passed on June 10. The area taken from the natives was 483,000 acres, about one sixth of the Bechuannaland reserves, with a population of about 8,000 out of the total native population of 57,000. After the rebellion was crushed by the storming of Langeberg, the Government made provision for the Bechuannas, who were likely to starve in their own country, having lost everything in consequence of the rinderpest and the failure of the crops. It was decided to place them as indentured laborers with Cape farmers to work for stipulated wages. Government agents were to visit the farms to see that the men were treated humanely. The rebels had in many instances surrendered on condition that they be allowed to return to their homes. The Government of Cape Colony, however, resolved that there should be no more wars in Bechuannaland, decided to deport the population of the disturbed district. Several thousands were carried off to the south and distributed among the farmers on five years' contracts with wages at the rate of 10s. a month for able-bodied men. Philanthropic societies in England protested against this form of veiled slavery as a violation of the emancipation act of 1834.

German Southwest Africa.—The German protectorate, extending 130 miles along the coast and inland to 20° of east longitude in the south and 21° north of 22° of south latitude, with a strip running along the Chobe river down to the Zambezi north of 18° of latitude, has an estimated area of 390,000 square miles and a population of 200,000 Hottentots, Bushmen, Damaras, and Kaffirs. The white population in 1896 was 2,025. The Imperial Commissioner is Major Lentwein. The revenue for 1895, including an imperial contribution of 1,000,000 marks, was 1,027,740 marks. The expenditure

was 2,457,580 marks. The budget for 1898 makes the revenue 3,015,000, and the expenditure 3,505,000 marks. The imports by sea in 1894 were valued at 944,665 marks, exports 100,843 marks. The trade overland is minor ground. A harbor is being built at Swakop river mouth, the English port of Walvisch Bay, which is now the only practicable harbor. Copper and gold have been found, but they have not yet been worked with profit. The natives raise large herds of cattle in Damara land. Sheep and native goats are bred also.

The native risings in Bechuannaland and other British territories stirred the warfare spirit of the Hottentots of Damara land. On July 5 a band of 200 in a well-fortified *kloof* repelled a German force near the British border. Early in August the Germans attacked the position with artillery and dispersed the rebels. Their leader, Keyishah Afrikaner, fled into British territory, where he was arrested in September. The Government, by means of disciplinary and other measures, endeavored to prevent the entrance of the rinderpest, but in 1897 it swept through German Southwest Africa with disastrous effect. The dearth of cattle determined the Government to build light railways on which the cars will be drawn by mules, hundreds of which were imported for the purpose from the Argentine Republic. A harbor is to be constructed at the mouth of the Swakop river that will render the Germans independent of Walvisch Bay, and from the new port to Windhoek, the capital, a line of railroad will be built.

Natal.—The Constitution of 1893 vests the legislative power in a Legislative Council of 11 members appointed for ten years, half being replaced every five years, and a Legislative Assembly of 37 members, elected for four years by voters qualified by possessing real property of the value of £50, or paying £10 rent, or having an income of £26. The number of electors in 1896 was 9,483. The assent of the Governor, revocable within two years, is required before any bill can become law. The Governor is Sir Walter Francis Hely-Hutchinson, appointed in 1893. The ministers at the beginning of 1897 were: Premier and Colonial Secretary and Minister of Education, Sir John Robinson; Attorney-General, Harry Escombe; Treasurer, G. M. Sutton; Minister of Native Affairs, F. R. Moor; Minister of Lands and Works, T. K. Murray.

Area and Population.—The area of Natal is estimated at 20,461 square miles. The population in 1891 was 543,913, consisting of 46,788 Europeans, 41,142 Indians, and 455,983 Kaffirs. Durban, the capital, had a population of 27,984 in 1894. The attendance in the aided and inspected schools for whites in 1896 was 7,840, and about 2,000 children attend private schools. About 96 per cent. of the white children receive instruction. The Government expenditure on education in 1896 was £41,000. The native schools have an attendance of 6,790 and receive £5,200 from the Government, which granted £1,825 to Indian schools with a daily attendance of 2,919 scholars.

Finances.—The revenue of the colony from ordinary sources in the year ending June 30, 1895, was £1,169,780, of which £436,469 came from railways, £189,926 from customs, £290,349 from excise, £45,320 from land sales, £54,729 from the post office, £15,767 from telegraphs, £23,297 from stamps and licenses, and £84,868 from the ration-hut tax. The total expenditure was £1,148,000, of which £203,176 represent railroad expenses, £64,796 public works, and £116,234 salaries. The expenditure from loans was £147,487. The public debt on June 30, 1895, was £8,654,000. There is a body of 259 European mounted police, the cost of which and of the jails of the colony was £78,820.

for the year, besides which the Government contributed £34,325 to the expenses of the volunteers, who number 1,531 men.

Commerce and Production.—There were 203,293 acres cultivated by Europeans in 1895. The leading crop for export is sugar, of which 20,401 tons were exported. Of tea 737,000 pounds were gathered from 2,297 acres. Corn, wheat, oats, and green crops are grown. The natives had 376,780 acres under cultivation. Europeans owned 27,758 horses, 229,512 cattle, 950,187 sheep, and 60,582 Angora goats, and natives 30,871 horses, 508,938 cattle, 19,282 sheep, and 285,517 goats. The coal output in 1895 was 160,115 tons. The total value of imports in 1895 was £2,469,303. The principal articles are haberdashery and apparel, iron manufactures, leather goods, flour and grain, cottons, woollens, machinery, and beverages. The value of the exports was £1,318,502. Gold, wool, and other products of the Dutch republics make the bulk of the exports. The export of wool was £452,412; of gold bars, £203,623; of coal, £72,345; of sugar, £56,961; of hides and skins, £46,270; of Angora hair, £28,610; of bark, £21,345.

Navigation.—During 1895 there were 540 vessels, of 788,495 tons, entered, and 536, of 781,571 tons cleared. The shipping of the colony consisted of 13 sailing vessels, of 674 tons, and 12 steam vessels, of 820 tons.

Railroads.—The railroads, which belong solely to the Government, have a length of 402 miles. There is a line from Durban to the border of the South African Republic, 307 miles, connecting with a railroad that runs through to Johannesburg and Pretoria, the total distance from the port of Durban to Pretoria being 511 miles. Branches have been built to Verulam, Isipingo, and Harrismith, in the Orange Free State. The capital expenditure up to the end of 1895 was £6,117,211; gross receipts for 1895, £526,494; expenses, £278,756, leaving a net revenue equal to 4.05 per cent. on the capital.

Cabinet Changes.—On Feb. 13 Sir John Robinson resigned the premiership on the ground of ill health. Harry Escombe, the Attorney-General, reorganized the ministry. In September the Government, in compliance with a request of the South African Republic, granted rebates amounting to the whole customs duty on numerous articles of the transit trade. The general elections took place near the end of that month, and the ministry sustained an unexpected defeat. Mr. Escombe and his colleagues resigned, and on Oct. 5 Mr. Binns formed a new ministry, in which he took the post of Colonial Secretary, with the premiership, Mr. Bale became Attorney-General and Minister of Education, Mr. Hime Minister of Public Works, Mr. Hulett Minister for Native Affairs, and Mr. Arbuckle Treasurer.

Indian Immigration.—The people of Natal were greatly excited at the beginning of the year by the arrival of two ship-loads of East Indians. The importation of coolies to work on the plantations on time contracts has long been permitted, but the settlement in the country of Indians whose contracts have expired or the immigration of free Indians has always been unpopular, and various restrictions and regulations, based ostensibly on sanitary or other legal grounds, have been adopted to deter Indians from remaining in Natal. An Indian is liable to be arrested at any time unless he can produce a pass to show that he is a free Indian and not an indentured laborer. An indentured Indian on becoming free pays a poll tax of £3 a year as long as he continues to live in the colony. Although British subjects, they are denied the electoral franchise under a law withholding it from natives of all countries not endowed with parliamentary institutions. The Government high schools

are closed to Indian students. To prevent the landing of the Indians from the ships the inhabitants of Durban organized themselves to obey leaders and to assemble at the wharves prepared to resist their landing by force. They demanded that the Government send them back to India at its own expense, and that a law be made forbidding the further immigration of free Indians. The ships were held in quarantine, and meanwhile a bill was passed conferring powers on the Government to impose quarantine indefinitely on ships with Indians on board. Another bill established new licensing restrictions upon traders on the pretense of preventing unsanitary conditions. A law to exclude undesirable immigrants was not directed exclusively against Indians.

Zululand.—The territory that was formally annexed by Great Britain in May, 1887, extending north of the Tugela river, the boundary of Natal, to the border of Tongoland and to the South African Republic on the northwest, has an area of about 12,500 square miles and a population estimated in 1895 at 1,246 whites and 165,121 natives. The Resident Commissioner, Sir Marshal Clarke, administers the country under the direction of the Governor of Natal, who is also Governor of Zululand. The police force is composed of 250 natives. The Zulus, who raise cattle and till the soil, pay a hut tax of 14s. Gold, silver, lead, copper, tin, iron, asbestos, and coal are found. Companies organized for gold mining have not yet met with success. There are 87 miles of telegraph. The revenue in 1895 was £51,746, and the expenditure £66,172.

Orange Free State.—The Constitution proclaimed on April 10, 1854, and amended on Feb. 9, 1866, and May 8, 1879, vests the legislative power in the Volksraad, consisting of 58 members, elected for four years, half of them retiring every two years, by the votes of the burghers possessing real property worth £500, or paying £36 a year for leased property, or having an income of £200, or owning £300 worth of personal property. The executive power is vested in a President elected for five years. The President is T. Steyn, elected Feb. 21, 1896.

The area of the republic is estimated at 48,326 square miles. There was in 1890 a white population of 77,716, consisting of 40,571 males and 37,145 females. The natives numbered 129,787, of whom 67,791 were males and 61,996 females, making the total population 207,503. Education is controlled by the Government, but is not compulsory, nor is it free, except for the poor. There were 162 Government schools in 1895, with 220 teachers and 4,867 pupils.

The revenue for ten months ending Dec. 31, 1895, was £259,589, and the expenditure £271,935. Of the receipts, £93,190 were import duties, £41,618 stamp duties, £28,576 transfer duties, £26,347 post-office and telegraph receipts, £10,425 quit rents, and £7,810 the native poll tax. Of the disbursements, £40,169 were for salaries, £40,000 for public works, £36,755 for education, £23,905 for posts and telegraphs, £10,043 for police, and £3,900 for the artillery.

Every able-bodied man in the country between sixteen and sixty years of age can be called into military service by the field cornet of his district in case of war. The number of burghers fit for service in 1896 was 17,381. There is an artillery corps, which was doubled in 1896, when a new fort was built for the protection of the capital, Bloemfontein. The present strength is 102 men, besides a reserve of 350 men who have served their term.

The land is divided into about 6,000 farms, having a total area of 24,675,800 acres, of which 250,600 acres are cultivated. Most of the land is only

adapted for grazing. There were 248,878 horses, 276,073 draught oxen, 619,026 other cattle, 6,619,902 sheep, 858,155 goats, and 1,461 ostriches in the country in 1890. There are good coal mines, and gold is found. The diamonds of the Orange Free State are usually of fine quality; the product in 1894 was 282,598 carats, valued at £428,039.

Foreign commerce passes through the Cape and Natal ports. The imports for 1895 were estimated at £926,567, of which £676,716 came from Cape Colony, £168,966 from Natal and the South African Republic, and £80,885 from Basutoland. The estimated value of the exports was £1,515,845, of which £519,987 went to Cape Colony and £961,890 to the South African Republic. Wool is the chief export, and hides, diamonds, and ostrich feathers come next in order. The railroad from Norval's Point, on the Orange river, to Bloemfontein, 121 miles, and the continuation to Viljoen's Drift, on the Vaal river, 200 miles, were built by the Cape Government, and have been transferred to the Government of the Republic. Bloemfontein is connected with the telegraph systems of Natal, the South African Republic, and Cape Colony by 1,500 miles of telegraph lines.

Politics and Legislation.—The railroad built through the Orange Free State by the Cape railroad administration, connecting the colonial lines with those of the South African Republic, became the property of the Free State Government for the price of £850,000, and passed into its possession on Jan. 1, 1897. An aliens bill revoking the franchise exercised by resident foreigners was discussed in May. The members of the Raad were equally divided on the question, though the bill involved an amendment of the Constitution, which conferred on aliens the full franchise denied to Uitlanders in the Transvaal. Another bill was passed in June granting the franchise to Uitlanders only after three years' residence, but not requiring them to forswear allegiance to their native country. To make this a law three fourths of the Volksraad must ratify it in the succeeding year. A treaty of amity and friendship with Germany was ratified. A commission was appointed to revise the Constitution and submit the proposed amendments at the next session of the Volksraad. The Raad agreed to the principles of closer union with the Transvaal, and afterward ratified the political treaty negotiated by the two Presidents. The customs union with Cape Colony was ratified on June 20.

South African Republic.—The legislative authority is vested in two houses, each consisting of 24 members elected in as many districts. The members of the First Volksraad are elected by the first-class burghers, comprising white male citizens who resided in the country prior to May 29, 1876, or who took part in the war of independence in 1881 or the Malaboch war of 1894, and their sons from the age of sixteen. The Second Volksraad is elected by the second-class burghers, comprising naturalized aliens and their sons from the age of sixteen. A white alien can become naturalized after residing two years in the country by registering his name, taking the oath of allegiance, and paying a fee of £2. Naturalized citizens of twelve years' standing may be made first-class burghers by special resolution of the First Volksraad. Sons of aliens registered at the age of sixteen may become naturalized at the age of eighteen and acquire the rights of first-class burghers at the age of forty. Aliens entering the Republic since Jan. 1, 1897, must be provided with means of identification and prove that they can support themselves, and must further have traveling passports good for three months, or for one year if they intend to remain. The executive power is vested in a President, elected for five

years by the votes of the first-class burghers. He is assisted by an Executive Council, consisting of 4 official members and 2 nonofficial members, elected by the First Volksraad. The State President is S. J. P. Krüger, elected for his third term on May 12, 1896. The Vice-President is Gen. P. J. Joubert. The Executive Council in the beginning of 1897 was composed as follows: Commandant-General Gen. P. J. Joubert; State Secretary, Sir W. J. Leyds; Superintendent of Native, Commander P. Cronje; Minute Keeper, J. H. M. Kock; nonofficial members, M. A. Wolmarans and S. W. Burger.

The revenue for six months in 1896 was £2,976,000, more than double that of the full year 1891. The increase is due to the receipts for horses, royalties, etc., from the gold fields. The expenditure for the six months was £1,490,008, leaving a balance of £1,510,945 in the treasury on June 30, 1896. Besides the revenue from the gold mines, the income of the Government is derived from land sales and quit rents, customs duties, a native hut tax, transport dues, and stamps. The revenue from the gold mines in 1895 amounted to £1,848,571 out of a total of £3,539,955. In the estimates for the full year 1896 the revenue was taken at £3,862,193 and the expenditures at £4,216,657. In the latter sum are included the extraordinary expenditure of £300,000 for preventing the spread of the rinderpest, £730,000 for public works, £243,510 for the purchase of war material, and £585,650 for other purposes. The public debt amounted in September, 1896, to £2,690,579, consisting principally of a loan of £2,500,000 contracted with the banking house of Rothschild and a debt of £156,662 due to the British Government on account of the British occupation in 1870-'80. The only permanent military force is the horse artillery, numbering 32 officers and 368 men. There is a force of 1,150 volunteers. In case of war every able-bodied citizen is called to arms.

The area of the South African Republic is 119,139 square miles. The census of 1890, which made the white population 119,128, divided into 66,408 males and 52,630 females, was very incomplete. In 1896 the white population was estimated at 180,000 and the native population at 609,879. Pretoria, the capital, has about 8,000 inhabitants. Johannesburg, the center of the mining district of Witwatersrand, had a population on July 15, 1896, of 192,714, of whom 51,225 were whites, 7,093 of mixed race, and 44,396 natives. The Government schools, in which Dutch is the language of instruction, had 7,679 pupils in 1895, in which year the Government expended £63,778 on education. In Johannesburg and other places the alien residents maintain separate English schools.

The soil is well adapted for agriculture as well as grazing, but the latter has been heretofore the chief industry, while grain and other produce has to be imported. There are 12,245 farms, of which number the Government owns 3,636, resident owners and companies 6,097, and alien owners and companies 1,612. The principal exports are gold, wool, cattle, hides, grain, ostrich feathers, ivory, brandy, and minerals. The dutiable imports in 1895 were valued at £9,816,304, of which £6,440,215 came from European countries and £3,336,677 from the neighboring countries and others. The duties collected were £1,085,419. The incorporated mining companies in 1895 numbered 170, with a total nominal capital of £43,544,989 and a working capital of £12,037,325. The output of the gold mines, situated principally at Witwatersrand and Barberton, was £8,569,555 in 1895, against £7,667,169 in 1894, £5,636,122 in 1893, £4,628,879 in 1892, and £2,917,702 in 1891. In six months of 1896 the product was £4,067,976.

Coal is mined in the Witwatersrand district and in the eastern part of the Transvaal. In 38 mines, employing 286 whites and 3,702 natives, 1,152,206 tons were produced in 1895, valued at £516,215. Silver, copper, and lead have been found, but mining is not now carried on. Tin is obtained from alluvial deposits in Swaziland, the product having increased from 30 tons in 1893 to 246 tons in 1895.

There were 424 miles of railroad in operation, 384 miles in process of construction, and 381 miles projected in September, 1895. The railroad traversing the Orange Free State and connecting with the railroads of Cape Colony has been continued by the Cape Government, by agreement with the South African Republic, through Germiston to Pretoria, 78 miles from where it crosses the Vaal river and 1,040 miles from Cape Town. The railroad from Natal has been built through to Johannesburg and Pretoria. The Delagoa Bay Railroad, which has been continued for 295 miles from the Portuguese boundary to Pretoria, has been in operation since Jan. 1, 1895. Of the Selatje line of 191 miles, 54 miles have been completed.

There are 1,952 miles of telegraphs in the republic.

Constitutional Conflict.—A constitutional conflict arose out of the decision of the High Court in the case of Brown vs. Dr. Leyds, delivered on Jan. 22, 1897. The plaintiff, an American prospector, had staked out gold claims within what had been proclaimed as public diggings, but when he applied for the licenses, he was informed that the proclamation had been withdrawn, and this was subsequently confirmed by a resolution of the Volksraad. One of the judges held that the resolution had no *ex post facto* effect, and did not extinguish Brown's rights acquired under the proclamation before it was revoked. Chief-Justice Kotze and Justice Ameshoff found for the plaintiff on constitutional grounds. The Government attorney contended that the second proclamation, after it had been confirmed by a resolution of the Volksraad, could not be brought into question, and quoted a statute of 1890, according to which the legal validity of any law or resolution duly promulgated can not be questioned in a court of law. The Chief Justice laid down the proposition that a mere resolution of the Volksraad can not alter a law that has been properly passed, and the further doctrine that neither a law nor a resolution has binding force in so far as it is contrary to the *Grundwet*, or Constitution of the Transvaal. This doctrine, derived from the principles of the Roman Dutch law and the analogy of the United States Constitution, was new in the Transvaal, directly contradicting a previous opinion given by the Chief Justice in a similar case in 1884, and it was regarded by President Krüger and by Dr. Leyds, his State Secretary, and Dr. Coster, the Attorney-General, as an encroachment on the powers of the Volksraad, which had itself enacted the *Grundwet* in the same manner as all other laws. They drafted a bill setting forth that the Volksraad is the supreme power in the state, that its resolutions have the force of law, that it has power to alter the *Grundwet*, that courts of justice are bound to respect and enforce whatever it has enacted or may enact, that the power of the courts to test laws or resolutions by the *Grundwet* has not existed and does not exist, and therefore enacting that existing and future laws and resolutions shall be acknowledged by courts of justice, which shall have no right to refuse to apply any law or resolution of the Volksraad on the ground that either in form or substance it is contrary to the *Grundwet*; further, prescribing a form of oath for all future judges, by which they shall declare that they will not arrogate to themselves the testing power; providing that a

judge who does so is guilty of malfeasance in office; and empowering the State President to ask the present judges whether they deem it in accordance with their oath and duty to dispense justice according to the existing and future laws and resolutions of the Volksraad, and not to arrogate to themselves the testing power, and furthermore empowering him to dismiss those judges from whom he receives a negative or unsatisfactory answer or no answer at all. The judges addressed a letter to the President in which they collectively declared that the proposed measure was a violation of the independence of the High Court, and urging him to postpone action until the ordinary May session of the Volksraad. In spite of their remonstrance the President pressed the Volksraad to pass the bill immediately, arguing that Cecil Rhodes and other enemies of the Republic had been kept at bay for years only by Volksraad resolutions, and that if the supremacy of the Volksraad were undermined the convention with England might be broken and then war would ensue. The bill was passed on Feb. 25, and the President put the prescribed interrogatories to the justices, demanding an answer by March 17. Sir Henry de Villiers, Chief Justice of Cape Colony, went to Pretoria and arranged a compromise by which the judges undertook for the present not to test the constitutionality of laws and resolutions of the Volksraad by the provisions of the *Grundwet* on the promise of the President that he would introduce without delay a measure providing that the *Grundwet* can only be altered by special legislation in a special manner, similar to the provisions of the Orange Free State Constitution, and that guarantees for the independence of the judiciary should be inserted in the *Grundwet*. The President requested the Volksraad to appoint a committee to act in conjunction with the Government in drafting proposals for a revision of the *Grundwet* and a codification of all existing laws, but the judges would not accept this as a fulfillment of his promise, which was to draft one himself, with their assistance and as speedily as practicable. In deference to their remonstrance the President agreed that the revision of the *Grundwet* should precede codification, which would be a task of two or three years. The committee of the Volksraad invited the judges to appoint some of their number to advise with other experts as to the procedure of revision. Chief-Justice Kotze and one of his colleagues declined the invitation, on the ground that the experts whom they were asked to confer with were the authors of the bill attacking the independence of the judiciary. Judges Morice, Gregorowski, and Esser were willing to give every assistance to the commission.

The Uitlanders.—It is estimated that the deposits of gold already discovered in the Transvaal contain £700,000,000 of the metal, and still more mines are located every month in the Lydenburg, Zoutpansberg, and Barberton districts. Coal and iron exist in inexhaustible quantities. The coal may not compete with the Welsh for use on ocean steamers, except perhaps on freight steamers in the Indian Ocean, but it is good enough for railroads and iron foundries. The healthy climate and productive soil of the Transvaal are sufficient, with its extraordinary mineral resources, which include also silver, lead, copper, and other baser minerals, to attract a large immigration, to which gold mining has given only the first impetus, and make it in time the most populous state in South Africa. Its gold production has been of late years the chief support of Cape Colony and Natal as well as of its own inhabitants. The grievances of the Uitlanders on the Rand are often at direct variance with the interests and sentiments of the governments and people of the British colonies. For instance, to enable the

low-grade mines to pay dividends the Uitlanders would diminish freight rates on the railroads and abolish all import duties on necessities of life, and in these demands they are likely to have the support of the Transvaal Government. The agriculturists of Cape Colony and Natal, on the other hand, induced their governments, in June, 1897, to raise the railroad rate on imported grain 50 per cent. The Cape Colonists complain that under the pass law respectable colored people from their colony are required to wear badges and to be in their houses by nine o'clock at night, but the Uitlanders desire to apply the pass law more stringently. In August the Volksraad modified the pass laws by exempting ministers, teachers, and tradesmen from wearing badges, but requiring them to carry passes costing £3 a year. The Dutch Afrianders of the republics as well as of the British colonies find fault with the Transvaal Government for importing from Holland men to fill Government posts and to teach in the Government schools. Yet it would be impossible to find in South Africa many persons trained to official life and capable of carrying on correspondence in English, German, and French, as well as Dutch, or teachers who can teach all those languages, as the new school law for the Witwatersrand requires. Since the Government of the Republic has agreed to grant subventions to the English schools on the Rand, the great educational grievance of the Uitlanders has dwindled to small proportions. The Government paid out £46,893 for education in 1896, and school fees and voluntary contributions amounted to £18,413, making the cost of educating an average number of 7,738 children in 395 schools £65,305, very nearly 25 per pupil. Of the total number in average attendance 93 per cent. were in the elementary grades, leaving only 7 per cent. in the intermediate schools. Only 20 per cent. received instruction in English, showing the preponderant position of Dutch as the language of the country and of the courts of law. In pursuance of a law passed in the latter part of 1896 for the education of children of poor parents and foreigners in the gold fields, the Government offered to grant £30,000 for this purpose in 1897 in the way recommended by the Superintendent of Education after consultation with a committee representing the English, French, German, American, and Dutch nationalities, on condition that Dutch-speaking children receive their education in the national language, and that the whole scheme conform to the educational laws and resolutions of the Volksraad. It is proposed to teach English-speaking and other foreign children in their own language only in the primary grades. In the middle education Dutch will continue to be the medium of instruction. The total sum appropriated for education in 1897 was £150,000, giving four times as much to Boer children as to Uitlanders. The actual proportions of the British and Afriander nationalities are variously estimated. The French consul, M. Aubert, estimated the population of Johannesburg itself in 1897 at 136,000 persons, of whom 50,907 were whites. The number of actual Europeans, apart from immigrants from British South African colonies and the Orange Free State, was ascertained to be 24,489, of whom 16,265 were English, Scotch, and Irish, 3,335 Russians, 2,263 Germans, 819 Dutch, 443 French, 311 Swedes and Norwegians, 206 Italians, 139 Swiss, and 709 from other countries.

In the autumn of 1897 the Government decided to promulgate a law passed in 1896, establishing a municipality in Johannesburg, which had hitherto been held back at the request of the Uitlanders themselves, who were not satisfied with the act. Half the members of the municipal council are to

be burghers, and the burgomaster, who has the casting vote, is appointed and paid by the Government and has power to suspend the operation of any resolution deemed to be in conflict with the law of the land, the final decision resting with the Government, not with the High Court. The council has power to make regulations for safety, public order, morality, and health, to issue loans, and to enter into contracts for public works, subject to the sanction of the Government. A bill to prohibit the working of stamp mills and mines on Sunday failed to pass the Volksraad, to the disappointment of the Doppers, who charged members with receiving bribes to vote against the measure. Notwithstanding the decrease of revenue and the necessity of borrowing £600,000 to meet the year's expenses, the Volksraad increased the salaries of its members to £1,200 a year. The Uitlanders and others raised a protest against the granting of the full burgher franchise to 800 Johannesburgers who took up arms for the Republic at the time of the Jameson raid. The Volksraad adopted a motion for the alteration of the qualification of members, with a view to exclude undesirable and disloyal persons. A law introducing voting by ballot will come into force in 1898. The Volksraad resolved that no state official shall be a candidate for the presidency without first resigning office.

The commercial and financial crisis in Johannesburg, that was aggravated by the Uitlander revolution at the beginning of 1896, was rendered more formidable in 1897 by a heavy decline of mining shares in the market, and extended throughout the Transvaal, owing to the ravages of the rinderpest and scarcity in the northern districts. The primary cause was overtrading and overstocking, such as had preceded a similar crisis in 1890. The excessive competition of importers, encouraged by the unrestrained granting of credit, resulted in a commercial collapse, which involved the banks and mercantile houses of Cape Colony and Natal and reacted on the banking and mining concerns in London, depressing still more the speculative value of mining stocks. The check given to importations and mining activity affected the finances of the Transvaal Government, causing its surplus to disappear, and even necessitating recourse to temporary loans, for expenditures went on increasing and votes for the relief of burghers impoverished by the rinderpest constituted an additional drain on the treasury. There were 4,803,000 tons of ore extracted in 1896, yielding on an average a little less than half an ounce of pure gold per ton. Though this yield was slightly inferior to that of former years, it is not found that the ore of the deeper levels, except in some localities, is poorer than the surface outcroppings. The machinery represents 138,000 horse power and was valued at £5,330,000, an increase of 21·6 per cent. over 1895. All the Transvaal mines, gold and coal, represented at the end of 1896 a nominal capital of £67,333,000, of which only 37 per cent. had been actually invested in the purchase of the mines and plant.

An industrial commission was appointed to report to the Volksraad on the measures of relief required from the Government. This commission, which began its investigations on April 15 and made its report on Aug. 6, sifted out the practical grievances of the Uitlanders that affected the gold-mining industry. There were 183 gold mines in the Transvaal in 1896, of which 79 produced gold of the total value of £8,603,821, while 104 yielded no gold, most of them being in a state of development and equipment, and only 25 companies declared dividends, the total amount being £1,718,781. The high cost of production prevented many of the

mines from paying dividends and caused some to cease operations. The commission found that whatever had been the mistakes in the past, most of the mines were controlled and engineered by financial and practical men, who devoted their time, energy, and knowledge to the interest of the mining industry, and who had introduced the latest machinery and mining appliances and the most perfect methods and processes known to science. If the Government neglected to lighten the burdens of the mining industry and refused to co-operate in devising means to work lower-grade mines at a profit, there was danger that 100 mines, which had cost from £200,000 to £500,000 to equip and develop and averaged £10,000 a month in working expenses, would have to close down, taking the annual amount of £12,000,000 out of circulation. The encouragement of agriculture would have a beneficial effect on the industry by reducing the cost of living, but the granting of concessions hampered the industrial prosperity of the colony. The question of labor was a vital one for the mines, for the cost of labor is from 50 to 60 per cent. of the total cost of production. Miners earn from £18 to £30 a month, according to ability, and these wages are not excessive, considering the cost of living at the mines. In fact, they are only sufficient to cover daily wants, and consequently it can not be expected that white laborers will establish their permanent abode in the Republic unless their position is ameliorated. The commission recommended that labor contracts signed in Europe be recognized as legal in the Transvaal, and that the cost of living be reduced for the white miners by removing all import duties from necessities of life and transporting these to the mines at the cheapest possible rates. In respect to Kaffir labor, the industry must draw its chief supply from the Portuguese territory on the east coast, and the commission suggested that fares to the mines on the Kaffirspoor Railroad be reduced by two thirds, the difference to be recovered from the laborers on the return journey, and that premiums be paid to Kaffir chiefs for the supply of laborers. The present requirement of the Witwatersrand mines is 70,000 black laborers, and within three years 100,000 will be needed on account of the development of deep-level mines. It is recommended that the native commissioners receive extra pay for the purpose of visiting Kaffir chiefs in the Transvaal to obtain laborers for them, and that laborers so obtained be conducted to the mines under supervision and lodged in compounds on the way. The Minister of Mines has recommended a law compelling all idle natives to work. The illicit sale of liquor to the natives at the mines constitutes a real grievance, and a much stronger application of the liquor law of 1896 is required. It is also desirable that the number of licenses be gradually reduced. Transit duties are unfair and ought to be abolished. Yearly the Republic pays £600,000 to the neighboring British colonies. It is recommended that the Government negotiate to have these duties abolished, previously removing its own duties on goods destined for the north. All import duties on food stuffs should be removed, as it is impossible to supply the population of the Republic from the products of local agriculture. The price paid at the mines for explosives of all kinds is twice as high as it might be, and the excess charge of 40s. to 45s. per case goes to enrich individuals for the most part resident in Europe. The commission recommends that the monopoly be canceled, if it can be done legally, and that in the mean time the Government avail itself of its reserved right to take into its own hands the importation of dynamite and other explosives and supply them to the mines sub-

ject to a duty of not more than 20s. per case; also that the manufacture of explosives in the Republic be allowed and protected by the same import duty, and that the importation of detonators be free.

On the matter of railroads, taking the gross revenue from traffic at about £2,000,000, as in 1896, the commission advised the Government to secure such a lowering of rates as will reduce the railroad earnings by £500,000, or 25 per cent., and not to proceed to the expropriation of the Netherlands company if such reduction can be obtained on its line. The reduction ought to be largest on the coal traffic, and the facilities for the delivery of coal and goods in general should be greatly improved on the Netherlands line. The greatest facilities should, moreover, be given to the transport of all agricultural produce at the lowest prices, and by night trains if required, to the principal markets of the Republic.

To check thefts of gold and amalgam, which are found to be on the increase, the commission recommended a stringent law on the model of the illicit diamond law of Kimberley. The pass law might be improved, but what is really required is that it should be applied more stringently, and it is suggested that its execution be placed under the control of a local board on the gold fields and the administration transferred from the Ministry of Mines to the Superintendent of Natives. The commission recommended the appointment of a board or commission in Johannesburg, consisting of 5 members nominated by the Government and 4 deputed by the mine associations and merchants of the city.

The people representing the mining interests of the Rand signed a petition urging expropriation of the Netherlands Railroad, abolition of the dynamite monopoly, vigorous administration of the liquor law, protection against gold thefts by a special detective force, better enforcement of the pass law and facilities for dealing with natives obtaining badges and arresting deserters, native locations for the procurement of a regular supply of labor, and a reduction of customs duties in order to cheapen the general cost of living. The Volksraad declined to receive this petition, as it has a rule forbidding the acceptance of memorials comprising more than one subject. It has been computed that under favorable laws the mining industry might save 40 per cent. in explosive gelatin and dynamite, 31 per cent. in coal, 15 per cent. in transport, 50 per cent. in native labor, and 37½ per cent. in white labor, representing a total annual loss of £1,600,000. The wages of white labor, including all employees from the manager down to the gangers in charge of the native boys, form on the average 30 per cent. of the total cost of production; native labor, 28 per cent.; explosives, 10 per cent.; coal, 8 per cent.; stores, 19 per cent.; general charges, 5 per cent. There are about 8,000 employees in the mines, receiving about £24 per month, while the black laborers, who outnumber the whites eight or ten to one, cost £4 a month each, including pay and food. Dynamite, which an American firm offered to deliver for 42s. 7d. per case of 50 pounds, costs from £5 to £5 15s. Coal costs 8s. per ton at the pit's mouth, and 20s. 8d. in the gold fields, about 30 miles distant. The Netherlands Railroad, with a capital of £1,165,000, earned £1,330,000 in 1896 over and above working expenses and the guaranteed interest on its loans. Of the profits the state received £514,000 as its share. The state can expropriate the railroad after a year's notice, and the company bargained for an extension of the concession for ten years as the price of a reduction in tariffs. In September the Natal Government removed most of the transit duties, practically rendering Durban a free port.

The South African Inquiry.—The parliamentary investigation of the Jameson raid promised by Mr. Chamberlain was put off for a year, and finally, at the beginning of the session of 1897, he moved for the appointment of a select committee to inquire into the origin and circumstances of the incursion into the South African Republic by an armed force, and into the administration of the British South Africa Company, and to report thereon, and further to report what alterations were desirable in the government of the territories under the control of the company. Before the inquiry began Cecil Rhodes returned to South Africa, and there received ovations from the South African League and other partisans of imperialism, while a large part of the Afrikaner population showed disapprobation by counter-demonstrations. Mr. Rhodes confessed that he had furnished money and arms for the rising in Johannesburg, and stationed the forces of the South Africa Company on the border for the purpose of invading the South African Republic and aiding in bringing about a revolution. Telegrams that were published showed that the design was to raise the British flag. He pleaded in justification that the Boer Government intended to introduce foreign, specifically German, influence into South Africa. The English directors of the company were not cognizant of the plot, nor was it shown that Mr. Chamberlain or Lord Rosemead was aware of it, though Dr. Rutherford Harris, the secretary of Mr. Rhodes, testified that in an interview with Mr. Chamberlain he spoke guardedly of an expected revolution in Johannesburg and of the desirability of there being a force on the border, but that Mr. Chamberlain demurred to the turn that the conversation had taken. Mr. Chamberlain hastened to give his version of the conversation, which was that Dr. Harris had offered to make a confidential communication relative to proceedings in Johannesburg, but that he had at once stopped him and refused to receive any confidential information. Letters of Mr. Fairfield, since deceased, who had to do with these matters in the Colonial Office, showed that he was partly informed of the revolutionary purposes of the Cape Premier, Sir John Willoughby and other British officers who took part in the raid were hoodwinked by Jameson and Rhodes into believing that the British Government was secretly abetting the design of overthrowing the Pretoria Government and annexing the Transvaal. The convicted officers were released before serving their full term of imprisonment, but they were deprived of their commissions. Sir John Willoughby pleaded with the War Office to restore the junior officers to the army, saying that he had guaranteed their commissions, having been informed by Dr. Jameson that the expedition was undertaken with the knowledge and assent of the imperial authorities. Other reasons for his belief that it was so Sir John Willoughby declined to tell the committee, on public grounds. There were people in England who knew of the plot, but whose names Mr. Rhodes refused to reveal. A number of cablegrams, believed to implicate men of high station, perhaps the heir to the throne, he and, after his departure, his counsel, B. F. Hawksley, refused to produce, nor did the committee exercise its power to compel their production. These telegrams Mr. Rhodes had in the previous year exhibited to Mr. Chamberlain; Sir William Vernon Harcourt was also aware of their contents, and it was stated by one of the counsel that it was owing to reasons of state that they were not made public. Henry Labouchere, after being challenged by Alfred Beit and Dr. Harris to prove his statements that the raid was accompanied by profitable bull and bear operations in mining stocks by its promoters, withdrew his accusations

because the stock brokers on whose evidence he relied refused to testify. On account of the missing telegrams Mr. Blake declined to join in the committee's report, while Mr. Labouchere gave a minority report. The report of the committee exonerates the directors of the British South Africa Company from complicity in the raid, with the exception of Alfred Beit and Rochfort Maguire, and with the further exception of Lord Grey, about whom the committee could form no opinion, owing to his absence in South Africa; but the committee considered that the board, in giving to Mr. Rhodes power of attorney to do what he liked without consulting his colleagues and committing to him the whole of the administration and everything connected with Rhodesia, did not fulfill the objects for which it was created nor offer sufficient security against the misuse of the powers delegated to the Chartered Company by the Crown. The committee found that grave discontent existed in Johannesburg, but that, whatever justification the Uitlanders may have had for action, there was none for the conduct of Mr. Rhodes, who as Prime Minister of Cape Colony, managing director of the British South Africa Company, and director of the De Beers and Gold Fields Companies had used his position and those interests to promote his policy in subsidizing, organizing, and stimulating an armed insurrection against the Government of the South African Republic, and had employed the forces of the Chartered Company to support such a revolution. He seriously embarrassed both the imperial and colonial governments, and his proceedings resulted in the invasion of a friendly state and in breach of the obligation in respect to the right of self-government of the South African Republic under the conventions. Although Dr. Jameson at the last moment invaded the Transvaal without his authority, it was always a part of the plan that those forces should be used in the Transvaal in support of an insurrection. Such a policy once embarked upon inevitably involved Mr. Rhodes in grave breaches of duty to those to whom he owed allegiance. He deceived the High Commissioner, he concealed his views from his colleagues in the colonial ministry and from the board of the British South Africa Company, and led his subordinates to believe that his plans were approved by his superiors. The committee expressed in conclusion an absolute and unqualified condemnation of the raid and of the plans which made it possible. The result caused for the time being grave injury to British influence in South Africa. Public confidence was shaken, race feeling embittered, and serious difficulties were created with neighboring states.

Diplomatic Disputes.—In October, 1895, the Government of the South African Republic closed the drifts which constituted the two ports of entry on the Vaal river to overseas goods in order to stop the illicit importation of arms, although the pretext put forward was that the Cape railroads were damaging other railroads leading into the Transvaal. Sir Jacobus de Wet, the British consul general, denounced this as an unfriendly act intended to divert trade from the Cape ports. W. P. Schreiner, then the Cape Attorney-General, considered it a violation of the London convention. When the British Government protested on this ground, President Krüger said that if the exportation of colonial goods made the closing of the drifts a violation of the convention he would shut out colonial goods as well. Mr. Chamberlain telegraphed that the extension of the proclamation to colonial goods was almost an act of hostility, and he informed the Cape ministry that the British Government was determined to insist on compliance with its demands, even if it should be necessary to

and a warlike expedition into the Transvaal, the cost of which the Cape Government would be expected to share. The Cape ministry acquiesced, agreeing to bear half the total expense and to furnish a fair contingent of the fighting force. The Prime Minister, Mr. Rhodes, believed that he could count on a majority of the Cape Parliament to support such action. In response to the threatening message of Mr. Chamberlain, the Transvaal Government opened the drifts on Nov. 6, 1895, and announced that they would not again be closed without consultation with the British Government, but protested in a subsequent communication that it had a right to regulate the ports of entrance, offering to submit the question to arbitration. The Cape ministers requested that the assurances they had given with reference to hostile action be regarded as strictly confidential. Nor was it ever known how ready the Cape Government had been to go to war with the Transvaal until Mr. Merriam on April 6, 1897, demanded the production of the papers in the Cape Parliament in order to show that the Rhodes ministry promised on a paltry matter of trade to support with arms an ultimatum of the Imperial Government.

When the British Minister for the Colonies, Joseph Chamberlain, finally proposed a parliamentary investigation of the Jameson raid and the South Africa Company he declared that the situation in South Africa had not improved, that President Krüger, though he had stated that his desire was "to heal sores, to forget, and to forgive," still withheld the promised full and favorable consideration to the friendly representations of the British Government, and that recent laws of the Volksraad were contrary to the London convention and would create, if they were enforced, a situation that would require "all our prudence, all our impartiality, and all our patience." The British Secretary of State affirmed that the raid was indissolubly connected with the discontent in Johannesburg, which was founded on the grievances of the Uitlanders, and any inquiry into the origin of the raid would be a sham unless it went carefully into this question of grievances and determined how far these afforded a justification for that discontent and agitation in Johannesburg which made the raid possible.

In consequence of the Jameson raid and the Johannesburg revolution the Volksraad had passed a law for the expulsion of any foreigner who by word or writing excites to disobedience or transgression of the law or takes any steps dangerous to public peace and order. Another law empowered the President to prohibit the circulation of printed or published matter the contents of which are in his judgment contrary to good morals or a danger to the peace and order in the Republic. There was also a law establishing a censorship over press telegrams. Another law required aliens traveling in the South African Republic to take out passports. An alien immigrants law, based more upon the economic conditions prevailing in South Africa, required of aliens intending to settle in the Republic that they should bring a certificate from their home authorities that they possessed the means or the ability to support themselves and would not become a burden upon the community.

Mr. Chamberlain found in these new laws violations of the convention of 1884. The alien immigrants law, he said, imposed a new condition on the entrance of British subjects into the Transvaal besides that of conforming to the laws of the Republic, which alone was defined in the London convention, and this new condition it would be difficult for many of the poorer though perfectly respectable immigrants to satisfy. The other alien

law imposed burdens upon aliens traveling or residing in the Republic in excess of the condition laid down in the convention. The State Secretary, Dr. Leyds, contended that these were police laws, but this Mr. Chamberlain would not admit. The State Secretary wrote that the Government of the South African Republic would be grateful if the British Government would propose some other practical measure for the exclusion of undesirable immigrants. Eventually the immigrant law was repealed without any admission that it was an infraction of the convention, after an agreement with the governments of Natal and Cape Colony, in conformity with which the latter enacted in the summer a law restricting immigration. Mr. Chamberlain, in the correspondence, alleged six violations of the convention. A treaty of extradition with the Netherlands, signed on Nov. 9, 1895, had not been submitted to the British Government for approval until attention was called to the omission after the exchange of ratifications. The extradition treaty with Portugal, signed on Nov. 3, 1893, had not yet been submitted for the Queen's approval. On Sept. 30, 1896, the South African Republic, without waiting for the invitation of the British Government, formally communicated to the Swiss Government its act of accession to the Geneva convention. The aliens expulsion law was, like the immigration law, declared to be contrary to the convention. Like exception was taken to the press law, and when the "Critic" and "Star," the Uitlander papers, were suppressed, the British Government demanded explanations.

The claim of the South African Republic upon the British South Africa Company for damages on account of Dr. Jameson's raid amounted to £1,677,938, of which £677,938 represented expenses connected with putting *commandos* in the field and compensation for the commandeered burghers, and £1,000,000 represented "moral or intellectual damage." President Krüger insisted on the right of the South African Republic to submit to arbitration the question of indemnity and other matters of controversy. Mr. Chamberlain asserted in Parliament that arbitration on the convention was out of the question, such being unprecedented between a suzerain and a subordinate power. This fresh assumption of suzerainty, which was expunged from the convention of 1884 by the omission of the clause contained in the convention of 1881, raised a storm of protests in Pretoria, and drew from President Krüger an explicit denial that the relation of suzerainty still subsisted.

Treaty with the Orange Free State.—In view of the menacing attitude of the British Government, President Krüger negotiated in Bloemfontein a defensive alliance between the South African Republic and the Orange Free State and the preliminary arrangements for a closer political union between the two Boer republics. One article of the treaty provides that the burghers of each state are to have the franchise in the other. If either state is attacked the other agrees to come to its assistance with its full fighting force, which would give a combined army of about 44,000 men between the ages of eighteen and fifty, the Transvaal contributing 27,000 and the Orange Free State 17,000. This treaty was ratified by the two Volksraads. Each state undertakes to help the other whenever its independence is threatened either from without or from within. Interstate laws about *commando* and other subjects connected with the alliance shall be passed by the legislatures of both countries. A federal council shall be created, consisting of 10 delegates, half of them nominated by the President of the Orange Free State and half by the President of the South African Republic, and this council is

to sit every year, alternately in Bloemfontein and Pretoria, for the discussion of subjects of common interest, especially the mutual protection, the commercial relations, and proposals touching the federal union of the two states and objections that may be raised thereto, recommendations tending to favor the unification of the laws of the two countries, and such other questions as the respective governments deem proper to submit. The State Presidents and their representatives shall always be able to take part in the deliberations. The decisions of this council of delegates are to be reported to the representatives of the two governments, to be submitted to the respective Volksraads for their action. The ultimate object of the new political treaty is to create a federal union between the two states.

Warlike Preparations.—At the same time that Mr. Chamberlain was demanding the repeal of Transvaal laws and discovering a series of breaches of the London convention in the acts of President Krüger's Government and defiance in his protestations, a menacing naval demonstration was made in Delagoa Bay, where a squadron of British vessels suddenly gathered in April without any known cause or object, unless it was to intimidate the President and Volksraad in the matter of the immigration bill. Mr. Goschen declared that they were there as a guarantee that British supremacy would be maintained. The sum of £200,000 was put into the military budget for an increase of the forces in South Africa, and it was announced that their strength would be permanently increased. The garrisons were largely augmented during the spring, and troops were stationed near the frontiers. The reinforcements consisted of 115 officers and 2,700 men, making the total force of imperial troops in South Africa 545 officers and 8,240 men. Meanwhile, the Transvaal Government proceeded with the construction of the two forts at Pretoria, and imported Krupp field and fortress guns, Maxims, hundreds of thousands of rifles, and millions of cartridges.

Cape Colony decided on the recommendation of English military experts to create a permanent military force of 11,500 men, including the already existing Cape mounted rifles, numbering 1,100 men. The colony is to be divided into 5 military districts, and service is to be compulsory on all white males between eighteen and sixty years of age. The forts are to be provided with heavy guns, and a burgher reserve of 2,000 men is to be formed.

The warlike feeling had subsided in England and South Africa when Sir Alfred Milner arrived in Cape Town in May to succeed Lord Rosmead, formerly Sir Hercules Robinson, as Governor of the Cape and High Commissioner for South Africa. The Transvaal Volksraad repealed the aliens bill on May 6, not in acknowledgment of an infraction of the London convention, but as an act of deference to the wishes of the Orange Free State and the British colonies. The outcome of the peace debate in the Cape Parliament showed that a forward policy would receive little support. On May 17 the British fleet in Delagoa Bay was dispersed.

On the occasion of the Queen's jubilee President Krüger ordered the release of W. D. Davies and Capt. Woolfs Sampson, the two Uitlander prisoners remaining in Pretoria jail, who had declined to make application for pardon, holding that they were entitled to the protection of the British Government, which was promised by Sir Hercules Robinson when they laid down their arms, but was afterward denied to them. The attitude of the British Secretary of the Colonies, though less aggressive, did not grow less imperialistic. After the South African Committee made its report he said: "Though Mr. Rhodes was in about as great a fault

as a politician or a statesman can be, nothing has been proved, and, in my opinion, there is nothing which affects Mr. Rhodes's position as a man of honor."

Swaziland.—In accordance with the Swaziland settlements, arranged between the British and Transvaal governments on Dec. 10, 1893, and ratified on Feb. 14, 1895, by the Volksraad, Swaziland, which was declared independent in the convention of 1894 and placed by the convention of 1893 in respect to the white settlers, under a Swaziland government committee, was finally placed under the protection and administration of the South African Republic. The territory is not to be incorporated in the Transvaal, and the natives retain their right to govern themselves after their laws and customs, but after three years they must pay a hut tax to the Boer Government and other taxes borne by the Swazis within the limits of the Transvaal. Customs duties shall not exceed those of the Transvaal. English and other white settlers can obtain full burgher rights. The sale of intoxicants to natives is forbidden. Swaziland is about 8,500 square miles in extent, with a native population estimated between 40,000 and 70,000 and 750 white settlers. The people are closely akin to the Zulus, and speak a different dialect of the same language. Ngwane, or Ubunu, the paramount chief, has an army of 18,000 men. The local revenue for 1896 was estimated at £3,000, the expenditure at £40,650.

British South Africa Company's Territory.—Rhodesia has proved disappointing as a gold-mining country, although indications of gold have been found over wide areas in both Mashonaland and Matabeleland, and innumerable claims have been filed and shafts have been sunk at Umtali, Salisbury, Victoria, Bulawayo, Gwelo, Tati, and other places. The whole amount of gold taken out from the beginning till 1897 has been less than 6,000 ounces, worth about £20,000. Machinery has been ordered, but the cost of transportation has been prohibitory hitherto. The railroad from Beira was completed to Massi Kessi in the beginning of 1897, and was expected to reach Salisbury by the middle of 1898. The railroad from Cape Colony through Bechuanaland to Bulawayo was opened on Nov. 4, 1897. Coal has been found near Salisbury, about 60 miles west of Bulawayo, and in Bechuanaland. The agricultural resources of the country are excellent, and water is abundant. But agriculture must depend entirely on the development of the gold-mining industry. Drought and locusts have affected agriculture here, as in other parts of South Africa, and there are peculiar endemic diseases that interfere with the raising of horses, cattle, sheep, and poultry. Malarial fevers make the low country almost uninhabitable for white men, but the elevated plateaus are cool and healthful. There are 26,500 square miles of territory, having an elevation of 4,000 feet or over, and 72,500 more over 3,000 feet above the sea. Companies have been formed to farm on a large scale. Cecil Rhodes, who has brought millions of capital into the country, and has large investments into railroads and other property, has given much attention to the development of agriculture and stock breeding. The rinderpest has almost exterminated the cattle.

After the suppression of the rebellion of the Matabele and Mashonas that began when Jameson's raid into the Transvaal left the country without military protection, Lord Grey, the Administrator who succeeded Dr. Jameson, and his new staff of officials decided on the policy of native administration for the future. The Matabele chiefs, 85 in number, were summoned to Bulawayo in the beginning of January, 1897, to hear how the country should henceforward be ruled. Instead of five dis-

tribes, as under Lobengula, there were to be twelve, over each of which would be placed a chief, who would be paid by the Government and be held responsible for the good conduct of the district. A native commissioner and assistant would be stationed in each district, and over all would be the chief native commissioner in Bulawayo. As the population of Matabeleland is about 150,000, the average population of a district is over 12,000. Some of the chiefs chosen were friendly, and others had taken part in the rebellion.

The parliamentary investigating committee failed to report on the administration of the British South Africa Company, or to suggest any alterations in the government of Rhodesia, leaving the matter to be dealt with by Mr. Chamberlain, who called into consultation the directors and officers of the South Africa Company. Sir Richard Martin, who was commissioned to investigate affairs in Rhodesia, made a report so damaging that the board of the Chartered Company asked time to put in an answer. This answer was given in a report by Earl Grey, which in no way removed the gravamen of the charges. Sir Richard Martin reported that compulsory labor undoubtedly existed in Matabeleland, if not in Mashonaland. The native commissioners procured such labor for the various requirements of the Government, mining companies, and private persons, endeavoring to obtain it through the *indunas*, if they could, and, failing in this, using force. As regards the cattle question, Sir Richard Martin was of the opinion that the fatal mistake made by the company in claiming all cattle as the property of the king immediately after the war, and the uncertainty that must have existed in the native mind regarding the proprietorship of the cattle previous to the distribution, together with the irritation caused by the frequent drafts made by the native police, and finally the unsatisfactory division, could not fail to produce widespread discontent and distrust. Many who were entitled by native law to cattle were left without, though others received more than their share. In new regulations issued in 1885 the company deprived natives of a part of the cattle that had been given to them in the first division. The company had, contrary to the charter, granted a monopoly of the mealie trade to a single trader. The causes of the insurrection Sir Richard Martin believed to have been the fact that the Matabele had never been thoroughly subdued in conjunction with labor and cattle regulations and the rinderpest and forcible slaughter of cattle, while the withdrawal of the police by Dr. Jameson afforded the opportunity. At the close of the war of 1893 scarcely any arms were surrendered to the Government; most of them were buried by the natives with a view to utilizing them again in the endeavor to reassert their independence as soon as a favorable opportunity presented itself. After the war of 1893 certain of the chiefs agreed to supply labor, but soon ceased to do so, and the Government, finding the supply cut off, introduced the practice of seizing the natives and carrying them off to labor in the mines, which to the Matabele, a wild and unbroken people, seemed nothing less than slavery. The native police were guilty of many acts of cruelty and extortion. The officials were in some cases too young and inexperienced for the important posts they held, and men not calculated to inspire the natives with respect for themselves, or the Government that they represented. A large section of the Matabele nation, notably the Matopos natives, whose chiefs played an important part throughout the rebellion, were not dealt with at all in 1893, and the operations of 1896 might be considered, so far as they were concerned, a continuation of the war rather than a rebellion.

The company agreed in 1894 to return to the natives cattle sufficient for their needs, but this was never done. Instead of this the staff of native commissioners and police organized for the purpose of carrying out the system of compulsory labor, seized and branded cattle belonging to the natives, besides forcing natives to enter into the service of the whites, or compelling the chiefs to furnish laborers. Whenever a native commissioner went to one of the *indunas* and said that a certain number of men were required at a given place, the chief was obliged to require the men to go, and these were taken from their homes and compelled to go and to work for wages in the fixing of which they had no voice.

The chiefs who took part in the rebellion of 1896 were thoroughly conquered, and not likely ever to contend against Maxim guns again. Not only did they lose heavily in men killed, wounded, and taken prisoners, but their kraals were burned and nearly all their grain and cattle carried off or destroyed, so that they were left on the verge of starvation, and their people only saved from famine by the bounty of their victors.

In Mashonaland the rebels were not yet completely subdued. The police patrolled the country, punishing those who attacked friendlies or whites. Near the end of January Major Gosling captured and burned the kraal of the chief Seka, whose people fled to inaccessible caves. In the beginning of May more active operations were undertaken. Shangwe's stronghold, which the Matabele had always failed to take in their raids against the Mashonas, was captured by Col. de Moleyns. When the rebels were cleared from the plains the troops had to hunt them out of the caves in the hills, whence they descended to lift cattle and destroy crops. The transcontinental telegraph wires were torn down to be converted into bullets. The troops established cordons and built forts round the hills, as was done in Matabeleland, and demolished the caves with explosives. On July 10 Chicumba's kraal, on the Unyani river was captured, and the remaining rebels fled from this district. In the vicinity of Fort Charter fighting still went on. The Matabele at Marandella rose, but were soon suppressed. Sir Richard Martin took command of operations against Mashingombi, whose kraal was taken by a combined movement of police and hussars on July 25. The Hartley district was cleared and the rebels trekked northward toward the Zambesi. It was supposed that the Matabele, though generally quiet themselves, incited the Mashonas to rise. After some more vigorous fighting the rebellion exhausted itself early in September, when most of the rebel chiefs offered to surrender, and all were evidently anxious for peace. They were given to understand that they would be treated leniently if they surrendered promptly and gave up their guns.

Portuguese Possessions.—The Portuguese possessions in Africa south of the equator are reduced by the Anglo-Portuguese arrangement of June 11, 1891, to Angola and Benguela, on the west coast, with Ambriz, Mossamedes, and Portuguese Congo, having a total estimated area of 457,500 square miles and 2,000,000 inhabitants, and Portuguese East Africa, comprising the provinces of Mozambique and Lourenço Marques, which have an estimated area of 261,700 square miles and a population of 1,500,000. In Angola, which had in 1895 a revenue of 1,634,800 milreis, and expended 1,532,637 milreis, the imports amount to 2,870,000 milreis and the exports to 3,250,000 milreis. There are 180 miles of railroads in operation, and 230 miles more are partly built. The length of telegraph line is 260 miles. The boundary between Angola and the British sphere in Central Africa is the western limit of the Barotse kingdom. This kingdom is

included in the British sphere, and its boundary, according to the provisional agreement that has been extended till July, 1898, will be determined by an Anglo-Portuguese commission. The royal commissioner in Angola is A. de Brito Capello.

The boundary between British South Africa and Portuguese East Africa starts from a point opposite the mouth of the river Arongwa, or Leangwa, runs directly south to 16° of south latitude, which it follows as far as its intersection with 31° of east longitude, runs thence eastward to the point where the river Mazoe is intersected by the thirty-third degree of longitude, which it follows southward to 180° 30' of south latitude, and thence runs along the edge of the Manica plateau southward to the Sabi river, which it then follows down to the Lunte, and from the confluence of the two rivers strikes across in a straight line to the northeastern point of the boundary of the South African Republic, with which the province of Lourenço Marques is contiguous to the border of Amatonga. North of the Zambesi the Portuguese territory extends inland to Lake Nyassa, being divided from German East Africa by the river Rovuma, and extends up the Zambesi to Zumbo, but the British Central African protectorate, or Nyassaland, forms a wedge that takes in the eastern and southern shores of Lake Nyassa and the upper Shire country. The Governor General of Portuguese East Africa is Major Mousinho de Albuquerque. The estimated revenue for 1895 was £296,857; expenditure, £345,587. The imports at the port of Mozambique in 1895 amounted to £95,300, and the exports to £37,122. At Quilimane the imports were £94,537; exports, £76,344. At Beira the imports were £160,570; exports, £17,950; transit trade, £142,060. At Lourenço Marques, which has a European population of 1,700, the imports were £295,203; exports, £28,309; transit trade, £669,213. The principal imports are cottons, spirits, beer, and wine. The exports are oil nuts and seeds, caoutchouc, gum, ivory, and sugar. In Manica Englishmen and others have begun to mine for gold. The Mozambique Company obtained a royal charter in 1891 to administer for twenty-five years the districts of Manica and Sofala. The railroad from Delagoa Bay connecting with the Transvaal line to Pretoria has a length of 57 miles in Portuguese territory, and 290 miles in all. The railroad from Beira in the direction of Mashonaland is open from Fontesvilla to Chimoio, 118 miles. There are 300 miles of telegraph line connecting Beira with Salisbury and Lourenço Marques with the telegraphs of the Transvaal.

Native War.—In March an expedition was sent out against the rebellious tribe of Namarallos, who fled after two defeats. A few weeks later five native chiefs in Gasaland revolted. The revolt extended on both sides of the Limpopo, necessitating the dispatch of fresh troops from Portugal, and the departure of the Governor General, Major Mousinho de Albuquerque, to the scene of action with whatever troops could be spared from Mozambique. He dismissed the Governor of Lourenço Marques, and set out in July with a body of troops dangerously small for the purpose of quelling the rebellion. During his absence natives on the Zambesi under the chief Camuinba seized a Portuguese gunboat, massacring the crew, and also captured two cannon. On July 21 Major Mousinho de Albuquerque won a victory over the chief Maguimana near Chimbuto, the capital of Gasaland, routing 7,000 natives. On Aug. 10 he engaged the rebels again at the foot of the Lebombo mountains, and after severe fighting administered a crushing defeat that ended the rebellion, Maguimana being killed and all the other leading chiefs made prisoners.

CHEMISTRY. In his annual review of pure chemistry, July, 1897, M. A. E. notices as one of the most important events of the year the liquefaction of fluorine by Moissan, Moissan, and Dewar. Of other less important work the author sees nothing but a little more confusion, owing to the monotonous continuity of scientific productions of unequal value. The science of chemistry is extending every year in new directions. It now includes pressure, cold, electricity, etc. It is being enriched principally by the determination of volumes, the measurement of constants, and by more minute work striving to show whether what we have so long admitted is really true. After a long period, during which it has seemed as if science was getting so pure as to be useless, students are coming back to the traditions of Gay Lussac and Berthollet, and are endeavoring to adapt the modern lofty ideas to the wants of mankind. Thus, Lord Rayleigh proposes to make the direct oxidation of the nitrogen of the air commercially practicable by means of the electric current. Mr. Liversidge has tested various deposits of maritime origin for gold, and has found that the Stassfurt salts contain 0.13 of a gramme per ton. It is not only gold that is so widely disseminated, but also, as Mr. Hartley has shown, the rare earths and metals. In 93 different iron ores he found always either silver, rubidium, copper, gallium, iridium, or thallium. Mr. Shenstone has found that the halogens, chlorine, bromine, and iodine combine with mercury in a state of perfect dryness, but that ozone will not do so except in the presence of aqueous vapors. Many other interesting results have been obtained in detailed workings, the general bearings of which have not yet been sufficiently determined to make them of more than technical interest.

Chemical Theory.—The lecture of Prof. Richard Meyer before the German Association of Naturalists and Physicists, on the relations of theoretical chemistry and research to national industry, included a review of the metamorphosis of the theory of chemical types into that of the valence of the elements, which ultimately gave rise to the chemistry of the benzol derivatives. The practical and economical results of these theoretical doctrines were manifested in the rise of the coal-tar industries, which have exercised an immense influence and have contributed to progress in many branches of hygiene and medicine. The long series of coal-tar or aniline colors, "the introduction on a large and cheap scale of carboic and salicylic acids, and the ever-increasing array of synthetic, antipyretic, and other remedial agents, made their victorious and triumphant way to all countries, and the chemical industry of Germany rose to an unprecedented degree of magnitude and prosperity." One of the most remarkable changes in this evolution was that the laboratories of the manufacturing establishments and of the great color works participated with the chemical and clinical research laboratories in this race after scientific and practical achievement, and had important parts in the progress of chemical knowledge and production as applied to sanitary and therapeutical sciences and arts. More recently the discovery and employment of serum therapy have introduced an additional factor into the application of synthesized remedial agents. The influence of modern chemical research and application has been correspondingly great upon other important branches of chemical industry, such as photography, sugar making and refining, tanning, and brewing. As a novel and progressive branch of applied science, electrochemistry is becoming more and more prominent.

Speculations tending to assign a determining properties to particular atoms or groups receive

some support from observations by Prof. Claisen of certain hydroxymethylene derivatives, which he describes as being all strong monobasic acids. They can all be accurately estimated by titration with normal alkali in aqueous alcoholic solution. They dissolve freely, even in the cold, in aqueous solutions of alkali acetates, liberating acetic acid. Among substances composed of carbon, hydrogen, and oxygen only, and not containing a carboxyl group, they appear to be the first that approach the monocarboxylic acids (except formic acid) in strength; and they even surpass some of them.

While it has been generally taught that the alcoholic fermentation of sugar by yeast was intimately associated with and dependent on the living action of the yeast cell, some investigators have believed that, notwithstanding the apparent impossibility of separating an alcoholic ferment from its organism, such a body nevertheless exists, and that alcoholic fermentation is thus, after all, only a special case of ordinary enzyme action, although one of peculiar complexity. These views receive confirmation from the researches of Dr. E. Buchner. By pounding up pure yeast with quartz sand and adding a certain amount of water, this author was able to squeeze out, under a pressure of between 400 and 500 atmospheres, a liquid which, when filtered, presented an opalescent appearance and an agreeable yeastlike odor. Care was taken to exclude all organisms from the liquid, and it was found, under such conditions, able to excite alcoholic fermentation in solutions of suitable sugars. The fermentative process was not inhibited by the addition of chloroform, even up to the saturation point, but a rapid precipitation of albuminous substances from the liquid was caused thereby.

Beginning in the "American Chemical Journal" a review of progress in the chemistry of the carbohydrates during 1896, W. E. Stone says that activity in that field is unabated, and it is becoming more and more evident to the student that the carbohydrates present opportunities for the study and illustration of chemical theories in no way exceeded by their very great practical and technical importance. The continued study and development of new reactions among them has been so fruitful that they may now be fairly regarded as among the most reactive of the general classes of carbon compounds. A large number of characteristic reactions have been well studied, involving the general principles of polymerization, condensation, oxidation, reduction, ether, and ester formations, etc. Contrary to the former view that the carbohydrates were extremely unstable and sensitive compounds, it now appears that they are capable of undergoing the most manifold changes, as regards both their chemical features and their physical properties. The sugars offer the best-known examples for illustrating the principles of stereo-chemistry, while the latest researches indicate that sugar molecules are unstable systems in which a variety of intermolecular transformations may be induced.

In some of his experiments on the formation and transformation of solid bodies Prof. Ostwald used homœopathic trituratives, and determined their activity in a physical chemical matter. In them he applied the well-known property possessed by crystalline bodies of determining the crystallization of solutions of their own substance in the condition called "supercooled" when brought in contact with them. Seeking to discover how small a particle of the crystal substance would be sufficient to determine crystallization, he, in order to obtain very minute crystalline particles, triturated the crystals with powdered quartz or with milk sugar. The proportions of the triturated substance to the indifferent vehicle in the several trituratives are di-

minished by tenths from $\frac{1}{10}$ in the first trituration to $\frac{1}{1000000000}$ in the tenth. Crystallization was induced when no higher than the ninth trituration ($\frac{1}{100000000}$) was used. Several substances, like salol, would work with this trituration only when freshly prepared; when older, the third trituration ($\frac{1}{1000}$) would still induce crystallization, but not the fourth ($\frac{1}{10000}$). Only a single exception to this general law was found in the case of borax, which induced crystallization as far as the seventeenth trituration. This result seemed so astonishing to Prof. Ostwald that he most carefully made another series of triturations, of which the ninth trituration ($\frac{1}{100000000}$) was still active, while the higher triturations were not. Homœopathy goes far beyond the ninth trituration, but Prof. Ostwald's experiments are in favor of the activity of minute medical doses, for when the $\frac{1}{100000000}$ part of a grain is sufficient to produce such visible results as the solidification of a solution by the formation of crystals, we can hardly say that the ninth trituration contains no more of the active substance.

A series of researches have been carried on for six years by Mr. A. E. Tutton into the relation that may exist between the chemical composition of solid substances and the nature of the crystals which they are observed to form. The author sought especially to determine exactly the differences presented by certain well-defined series of isomorphous salts. The investigation was one calling for the use of very careful methods. Certain series containing in their different members the alkali metals potassium, rubidium, and cesium, were chosen as the special objects of the study. The result of the investigation has been to show that all the morphological properties of each of the isomorphous series exhibit progressive variations that follow the order of progression of the atomic weights of the alkali metals which the salts contain. Hence it may be said that these variations are functions of the atomic weight of the alkali metals. Of course, the author explains, atomic weight is only one of the numerous properties of an element, and is employed simply as the most convenient reference constant that could be chosen to express fundamentally the difference in the essential nature of the atoms of different elements, and not because of any virtue in atomic weight *per se*. Expression is given to the principle deduced in the words, "The difference in the nature of the elements of the same family group which is manifested in their varying atomic weights is also expressed in the similarly regular variation of the characters of an isomorphous series of the salts of which these elements are the interchangeable constituents."

Prof. G. Linck had already called attention to the fact that the characteristics of crystals—that is, their geometric and optical constants—stand in direct relation to the atomic or molecular weights contained in them. This is most clearly shown in the eutropic series, by which is meant a series of substances crystallizing similarly, but differing only in that they each contain a different element, though the elements are yet similar according to the periodic system of Mendeleeff. If such a series is arranged according to increasing molecular or atomic weight, then the series, for all characteristics of the crystal, remains unchanged. The author has designated the fundamental law of these phenomena as "eutropy." Tables computed from data embracing the system to which the crystal belonged, its axial relations, the specific gravity, and the atomic weight lead to the conclusions that the actual volumes of the various chemical compounds, if formed into equivalent crystals, stand in a very simple relation to each other; the weights of these equivalent volumes stand in the same rela-

tions to each other as the molecular weight; the volumes in a eutropic series increase with increasing molecular or atomic weights; the weights of equivalent volumes always increase with increasing atomic weights; bodies which are isomorphous but not eutropic likewise stand in a very simple relation to each other according to their crystal volume or their actual volume, as the case may be; many crystals which have heretofore been considered eutropic or isomorphie are not so, since they probably possess a larger or smaller molecular weight, according to the number of atoms.

The presidential address of Prof. William Ramsay before the chemical section of the British Association was wholly devoted to an exposition of his reasons for supposing the existence of an undiscovered gas and to the story of his search for an element of the atomic weight 20, situated in the periodic system between argon and helium. The author observed that many "triads" are found in the periodic system, with a difference in atomic weight of about 36 between the extremes, as fluorine, chlorine, manganese; oxygen, sulphur, chromium; nitrogen, phosphorus, vanadium, etc. If argon has an atomic weight of 40 and helium of 4 a triad might be expected composed of them, with a middle element having an atomic weight of about 20. The search of Prof. Ramsay and his assistant was made for this element, which, it was assumed, would probably be found, like argon and helium, an indifferent gas, by examining the gases from various minerals and mineral springs, and by fractionating helium by diffusion through porous plates without result further than that after 180 diffusions of helium two fractions were obtained, one of which was pure helium and the other helium with a small proportion of argon. The nonexistence of gas is, however, not proved, for if it occurs it is probably in far less abundance than helium, and it will be a work of extreme difficulty to separate it.

Experimenting with argon in order to determine whether it is homogeneous, and using a system of methodical diffusion, Prof. Ramsay and J. Norman Collie found by comparison of the density of the extreme portions that the separation, if any took place, was small. With helium the separation was more distinct, and, while the spectra were identical, the densities of the extreme portions, oxygen being 10, were as 1.874 to 2.133, and the refractions to that of atmospheric air being 1, as 0.1350 to 0.1524. Helium, therefore, if it consists of a mixture of two gases, is formed either of two gases of the densities 2.366 and 1.874, or of two gases of the densities 2.133 and 1.580. "But although this explanation is the most suitable, there exists another which deserves our attention. The spectrum of these two fractions shows no difference. It is not probable that two gases exist the densities of which are so near each other. The different gases do not possess a refraction proportional to their densities. It seems to us that we might admit that we have effected a real separation of the light molecules from the heavy molecules. The idea that all the molecules of a gas are homogeneous has never been submitted to the test of experiment. We do not know of any attempt at a separation of this kind of a gas regarded as homogeneous into two different parts. But our experiments show that this question deserves to be studied. If it can yield us similar results we must change our ideas on the nature of matter."

It has been long observed that during the slow oxidation of a number of substances in oxygen gas, or air, part of the oxygen becomes endowed with peculiarly active properties. Concerning the philosophy of the phenomenon, the tendency of recent investigation has been to show that the oxygen molecules split up into atoms (probably with opposite

electrical charges), one of which brings about oxidation, while the other forms what is called active oxygen. From experiments of his own, which he has described together with previously published results, M. W. P. Jorissen, of Amsterdam, concludes that "a body undergoing slow oxidation converts the same quantity of oxygen into the 'active' state as it itself takes up in the formation of the primary product of oxidation."

M. L. De Launay puts forward the view that agglomerated iron carbonate has not been deposited as carbonate from water, as is generally held, but that, like calamine and cerussite, it has been produced by the action of limestone upon the salts arising from the destruction of iron sulphides. It is pointed out in confirmation of this view that while massive sulphide of iron is always found in schists, the carbonate occurs with limestone.

Chemical Physics.—Mr. Crookes, in his researches on molecular bombardment, demonstrated that on placing diamonds in one of his tubes they quickly lost their luster and were coated with a black layer. M. Moissan, having obtained one of these diamonds which had been completely blackened by the bombardment, heated it to 60° C. in an oxidizing mixture of potassium chlorate and fuming nitric acid prepared from sulphuric acid exactly monohydrated and potassium nitrate fused and free from moisture. The action on the black layer was very slow. Graphitic oxide was produced, which at an increased temperature yielded pyrographitic acid, and this was easily destroyed by nitric acid. Hence the variety of carbon that coated the diamond was graphite. The temperature at which the transformation of the diamond into graphite took place must have been very high. Mr. Crookes had already proved that platinum and iridium could be fused in his tubes, but the temperature obtained in the bombardment was much higher, since the transformation of diamond into graphite requires the high temperature of the electric arc. The higher the temperature to which graphite is raised the greater is its resistance to oxidation.

In his comparative observations on the behavior of oxygen under the influence of the silent discharge of electricity when saturated with water vapor, and when carefully dried, W. A. Shenstone found, contrary to the statements of previous investigators, that oxygen is most freely converted into ozone when wet, and that well-dried oxygen yields only a very minute percentage of ozone. The results obtained also show that the ozone in ozonized oxygen is far more stable in the presence of water vapor than in its absence—that is to say, the change by which ozone is converted into oxygen is very greatly retarded by the presence of moisture. When carefully purified chlorine, bromine, and iodine, dried by very thorough treatment with prepared phosphoric oxide, were presented to the action of mercury prepared for the purpose and thoroughly dried, the metal and the halogen in every case interacted instantly and rapidly. Highly purified chlorine, when submitted to the silent discharge of electricity, did not undergo condensation. The abnormal expansion of chlorine, which has been described by several observers, appears to the author to depend upon the presence of impurities in the chlorine. The results observed by Dr. Budde at Bonn, in which chlorine expanded under the influence of the violet and chemical rays, are regarded by the author as having almost certainly been affected by the presence of moisture in the chlorine.

In his studies of the phenomena of supersaturation and supercooling, William Ostwald found that the temperature range below the melting point in which spontaneous production of crystals is impos-

sible is limited, the liquid being in stable equilibrium except toward a ready formed crystal. To this condition he gives the name *metastable*. At lower temperatures no nuclei are necessary, and the crystals form spontaneously. He concludes that when a system passes from any given condition to a more stable one it will not pass into the state which under the circumstances is the most stable, but into that which is nearest to the original state.

Experiments by Zelinsky with two hydrocarbons obtained by reduction from hexamethylene iodide—one by means of zinc and hydrochloric acid, and the other by zinc and hydriodic acid—prove that the former is the true hexamethylene, while the second is identical with methylpentamethylene. The hexamethylene ring, therefore, under the influence of hydriodic acid at 230° C. changes into a more stable isomeric form. The nature of this change agrees with Baeyer's "tension theory," according to which the pentamethylene ring is more stable than any other.

Experiments on the relative transparency of the alkali metals to the Röntgen rays, recorded by Prof. C. Mavangoni indicate lithium as the most transparent metal; but its transparency does not increase with the thickness. An anomaly exhibited in the greater transparency of sodium relative to potassium suggests that the transparency for these rays is a function of atomic weight as well as of density.

Liquid sulphur at 440° C. absorbs hydrogen sulphide, and gives it out on solidifying. This, M. A. H. Pélabon observes, can hardly be a true case of a solution of a gas in a liquid, for it is found that the amount absorbed increases with the temperature, and is given out only on solidifying, while no gas is given out by the solution in liquid sulphur, even into a vacuum.

New Substances.—In his work on gadolinite and samarskite earths, Delafontaine came to the conclusion, published in 1878 and 1880, that the yellow oxide erbia discovered by Morander in 1843 contained two earths, which he called *terbia* and *philippia*. The individuality of philippia was denied by two English chemists; but M. Marignac mentioned it in a paper on the samarskite earths in 1880, and Mr. W. Crookes, who first rejected it, has mentioned it among some of his fractional products of yttria. The author has since made an investigation of the fergusonite earths, which, though incomplete, enables him, as he believes, to show that the characteristics of philippium are such as to deserve the attention of those who are discussing the periodic law and the necessary modifications to Mendeleeff's classification of elements. Philippium has been found in gadolinite, samarskite, and the Texas mineral described as fergusonite. It is more closely allied to cerium and terbium than to any other of the yttrium and cerium metals. Its equivalent, the color of its subnitrates and that of the philippic salts, and the solubility of its formiate, separate it from terbium. These characteristics and the solution of potassium-philippo sulphate in potassium-sulphate solutions distinguish it from the two ceriums of M. Brauner and M. Schützenberger. It appears in two sets of compounds, the philippous and the philippic, corresponding to a white acid and an orange oxide. The salts of the first series are colorless, quite stable, generally crystallize well, and correspond to the lanthanum and yttrium salts. Philippic oxide has a deep orange-red color. Although philippium shows a very close resemblance to yttrium and cerium, the constitution of its compounds remains to be established by crystallography or otherwise.

G. G. Boucher, of Ulverston, England, has published his reasons for supposing that a new element or new elements other than the substances usu-

ally found may exist in cast-iron and blast-furnace boiler dust. The substance in question obtained from cast iron is a black powder, slightly soluble in cold strong hydrochloric and sulphuric acids, and very little more soluble on boiling in those acids. It is soluble in dilute and strong nitric acid, and very easily soluble in aqua regia. Heated in a current of air it glows and is converted into a yellow oxide. Its properties are further described in the author's paper. The substance in boiler dust is similar to this in every respect but one. It has the same aspect and forms an oxide similar in appearance, which produces the same chemical changes with the reagents experimented upon, except with the bichloride of tin. It is present in boiler dust in so minute quantities as to be more difficult to separate than in the case of cast iron. Several chemists have pointed out similarities in properties and reactions of this substance as described by Mr. Boucher with those of certain other substances whose presence in cast iron is common, and are not disposed to accept the hypothesis of a new element.

The discovery of a new series of compounds of very great interest is announced by MM. Constam and A. von Haussen. It was known that on electrolyzing the alkaline carbonates, M_2CO_3 , we obtain hydrogen and the hydrate of the constituent base at the cathode, and at the anode oxygen and carbonic acid, which recombines with a part of the base to form bicarbonate. The authors have observed that if we electrolyze a saturated solution of carbonate of potash and gradually lower the temperature, the disengagement of oxygen gradually diminishes at the anode, and finally ceases about $-10^\circ C.$; and further, instead of a crystalline bicarbonate being formed, we have a bluish amorphous powder, shown by analysis to consist of $K_2C_2O_6$; this is percarbonate of potassium. In explanation of its formation it is assumed that the carbonate of potassium in saturated solution first becomes dissociated into ions K and KCO_3 ; when electrolysis intervenes the two ions KCO_3 unite to form the body $K_2C_2O_6$. The phenomenon does not occur in dilute solutions, as the carbonate of potassium splits up into the ions K and CO_3 . The carbonate obtained in the manner described above should be quickly thrown on a filter and dried over phosphoric anhydride. From certain reactions described in their paper the authors conclude that the new body is in reality the neutral carbonate of a higher oxide, peroxide of potassium. It besides produces in the presence of acids, like the higher alkaline oxides and the alkaline earths, peroxide of hydrogen.

L. Prunier observes that in the study of the preparation of ordinary ether by means of sulphuric acid and alcohol most workers have omitted to take any notice of the presence of sulphonic acids and their derivatives. This group of bodies is, however, to be found in notable quantities in commercial ethers. It is also found in considerable proportions in the oils that have been used in the rectification of the raw product. By direct experiment it is possible to prove the formation of several sulphonic derivatives, especially toward the end of the operation. To separate the derivatives actually formed by the action of sulphuric acid, it suffices to heat sulphonic acid with dilute sulphuric acid to $140^\circ C.$, then add a little alcohol. By this means a small quantity of ordinary ether is formed, and several sulphonic derivatives of varying volatilities, some of which even distill over with the ether. They are formed in greatest abundance when the temperature exceeds $140^\circ C.$, and, above all, if undiluted sulphuric acid is used.

Metallic rubidium, as observed in the experiments of A. W. Titherley, behaves like the other

alkali metals toward ammonia, displacing one atom of hydrogen, and forming rubidamide, $RbNH_2$. Though not so energetic as in the case of lithium, the action is very rapid and begins in the cold. On heating in a silver boat to between 200° and 300° , oily drops of the amide quickly form and flow to a liquid in which the metal floats and partly dissolves in a deep-blue solution, at once decolorized and converted into rubidamide by the action of ammonia. Rubidamide crystallizes in plates, melting at between 285° and 287° F., higher than sodamide and potassamide, but lower than lithiumamide. At 400° F. it distills undecomposed in a current of ammonia. With water it is violently decomposed, giving ammonia and rubidium hydrate. Alcohol also decomposes it, and its behavior with organic substances is very similar to that of sodamide or potassamide.

Sodamide in its reactions with organic haloid compounds was observed by Mr. Titherley invariably to give rise to complex decompositions without appreciable replacement of the halogen NH_2 . The hydrogen of the sodamide, and not the sodium, reacts, giving hydrochloric acid, which with the amide yields ammonia, while the group NaN remains more or less intact, being found afterward as sodium cyanide and sodium cyanamide. Charring inevitably occurs. Sodamide on treatment with organic substances possessing a weak acid tendency, such as oximes and hydrazines, readily reacts, giving ammonia and sodium derivatives. In benzene solution these are obtained usually as fine crystalline precipitates, which may sometimes be crystallized from boiling benzene. Sodium acetoxime, sodium hydrazobenzene, sodium phenylhydrazine, and other compounds have been thus obtained. A series of substitution derivatives of sodamide formed by the replacement of one or both hydrogen atoms in $NaNH_2$, have also been prepared by the interaction of sodamide with aromatic amines and with amides. Those formed with organic amides are soluble without decomposition in alcohol, and their solutions, on treatment with alcoholic silver nitrate, throw down bright orange-red precipitates of the silver compounds, which are very unstable. From the color of these silver derivatives and the difficulty with which they and the sodium compounds appear to react with alkyl iodides, etc., the author concludes that the silver and sodium atoms, respectively, are directly attached to nitrogen, and that therefore the derivatives are to be represented as possessing the ordinary amide and not the imido-hydroxyl formula; the amides themselves are most probably tautomeric substances.

Among the substances obtained by Prof. William L. Dudley from the action of fused sodium dioxide on metals is a hydrated oxide of nickel, $Ni_2O_3 \cdot 2H_2O$, which was formed by heating nickel with sodium dioxide in a nickel crucible to cherry red. The surface of the melted mixture becomes covered with scaly crystals having the composition indicated. These crystals are almost black, lustrous, apparently hexagonal plates, soft, and bearing a resemblance to graphite. They begin to lose water at 140° —a lower temperature than that at which the substance is formed. Apparently similar compounds are formed by other metals, which can not, however, be conveniently studied on account of the vigorous action of fused sodium dioxide on crucibles of porcelain, iron, silver, gold, or platinum.

Five compounds of nitrogen and hydrogen are described by Dr. J. E. Mackenzie as at present known: NH_3 , ammonia; N_2H_4 , hydrazine; N_3H , azonitride; N_2H_2 , ammonium nitride; and N_3H_2 , hydrazine nitride. All these substances except ammonia are of comparatively recent discovery, and our knowledge of most of them is due to Theo-

dor Curtius. In 1883 Curtius began a series of researches on amido-acids, in the course of which he obtained sulphate of hydrazine and other salts, from which hydrazine hydrate, $N_2H_4 \cdot H_2O$ was separated by distilling with strong bases. The hydrate is a colorless fuming liquid, which boils at 119° C., destroys cork and India-rubber, and is a powerful reducing agent and poison. In 1865 Lœbry de Bruyn isolated free hydrazine by processes which have been described in the "Annual Cyclopædia." This substance is one of the strongest reducing agents, takes fire spontaneously in chlorine with formation of hydrochloric acid and nitrogen, reacts with sulphur in the cold with production of SH_2 and N , displaces ammonia from solutions of ammonium salts, forms two series of salts with acids, and has important condensations with aldehydes and ketone. Other methods of preparing it are described by Peckmann, Thiele, and Duden. Azonitride as described by Curtius is a colorless liquid with an unbearable odor, boiling at 37° C., capable of mixing with alcohol and water, and is frightfully explosive. Its metallic salts very much resemble those of hydrochloric acid, except that they are explosive; and ammonium nitride, N_3NH_4 , is the most perfect explosive known. Hydrazine nitride, $N_3N_2H_4$, is a crystalline substance which behaves like gun cotton, burning quietly on exposure to flame, but exploding on detonation or sudden heating.

In the electrolysis of a mixture of silver sulphide and silver chloride in an atmosphere of nitrogen, using platinum electrodes free from iridium, Theodor Gross found in the liquid a dark-gray powder insoluble in aqua regia and in ammonia. Melting this with alkaline carbonate, a substance resulted soluble in hydrochloric acid, which gave a brown precipitate with hydrogen sulphide. The presence was thus indicated of a new element, to which the author gave the name of bythium. A corresponding loss of sulphur occurring, and also of chlorine in a less degree, the author infers that bythium is formed by the decomposition of one of these substances.

In a paper on "The Chemistry of Methylene," read in the British Association, Prof. J. F. Nef, of Chicago, described the results obtained in studies of compounds containing dyad-carbon. The author has obtained a series of very unstable substances which he regards as acetylidene derivatives. All are violently poisonous. The monobromo derivative bears in its properties a remarkable resemblance to phosphorus, and is termed by its discoverer "vegetable phosphorus." It shines in the dark, burns on exposure to the air, and acts as a violent poison in the same way as phosphorus.

Naphthalene tetrabromide, the corresponding compound to naphthalene tetrachloride, already studied by several chemists, has been prepared by W. R. Orndorff and C. B. Meyer by treating naphthalene, in sodium hydroxide, with bromide. It appeared as a white crystalline substance, melting at 111° C. No isomeric compound could be obtained. The molecular weight was deduced only indirectly, and from this and by analysis the composition of the substance was found to be $C_{10}H_6Br_4$.

Pure carbide of iron, Fe_3C , has been prepared by M. Moissan by heating pure iron for three minutes in a carbon crucible with a current of 900 amperes, at 600 volts, and cooling as rapidly as possible by taking the mass from the furnace and pouring it directly into cold water. The ingot was crystalline in structure, and contained from 3 to 4 per cent. of combined carbon, but no graphite. From this the carbide was separated in brilliant crystals of exactly the composition Fe_3C . Water has no action upon this substance, even at 150° C., but hydro-

chloric acid gives a mixture of hydrogen and methane.

A substance described by G. de Chalmot as a silicide of copper, having the composition Cu_2Si , has been found in further experiments to be a mixture of silicon, copper silicide, and copper. It forms apparently homogeneous pure crystals. A silicide of iron, $FeSi_2$, has also been obtained by the author.

The chlorobromides of tin are formed by M. A. Besson by the action of hydrogen bromide upon stannic chloride, or by the action of hydrogen upon anhydrous stannous chloride in carbon tetrachloride solution, the latter method giving the best yield. $SnCl_2Br$, $SnCl_2Br_2$, and $SnClBr_3$ are thus isolated.

A gold phosphide, Au_3P , has been obtained by A. Granger. It is gray, very brittle, is easily destroyed if heated in contact with air, and is readily attacked by chlorine and aqua regia.

The preparation of alkali cobaltates is described by A. H. McConnell and E. S. Hanes, who show that cobalt forms an oxide, CoO_2 , an acid, H_2CoO_3 , and a series of alkali salts of the type of potassium cobaltite, K_3CoO_4 .

New Processes.—The physical properties of a large number of mineral and organic compounds of fluorine indicated theoretically that the liquefaction of that substance could be effected only at a very low temperature. Experiments for the production of that result were made in May by M. Moissan and Prof. Dewar at the Royal Institution, which possesses unrivaled appliances for the production of intense cold. Liquid oxygen, of which several litres were required, was used as the refrigerant. The apparatus having been cooled down to the temperature of quietly boiling liquid oxygen ($-183^\circ C$), the current of fluorine was passed through it without becoming liquefied, but at this low temperature the element had lost its chemical activity, and no longer attacked the glass. A vacuum having been made above the oxygen, a liquid was seen, as soon as ebullition took place, collecting in the glass envelope, while gas no longer escaped from the apparatus. Stopping with the finger the tube by which the gas had been escaping, so as to prevent air from entering, the glass bulb soon became full of a clear yellow liquid—of the same color as fluorine gas when examined in a stratum one metre thick—possessed of great mobility. According to this experiment, fluorine becomes liquid at $-185^\circ C$. As soon as the little apparatus was removed from the liquid oxygen the temperature rose and the yellow liquid began to boil with an abundant disengagement of gas, having all the energetic reactions of fluorine. Advantage was taken of the experiments to study some of the reactions of fluorine on bodies kept at extremely low temperatures. Silicon, boron, carbon, sulphur, phosphorus, and reduced iron did not become incandescent, and fluorine did not displace iodine from iodides. Its chemical energy was, however, still great enough to decompose benzene and essence of turpentine with incandescence as soon as their temperature rose to $-180^\circ C$. It thus seems that the powerful affinity of fluorine for hydrogen is the last to disappear. When a current of fluorine gas was passed through liquid oxygen, a flocculent white precipitate was rapidly formed, which quickly settled to the bottom. When separated, it was found to possess the property of deflagrating with violence as soon as the temperature rose.

In a subsequent paper ("Chemical News," Oct. 22, 1897) the authors (Moissan and Dewar) express the conclusions that fluorine gas is easily liquefied at the temperature of boiling atmospheric air. The boiling point of liquid fluorine is $-187^\circ C$. It is soluble in all proportions in liquid oxygen and in liquid air. It does not solidify at $-216^\circ C$. Its density is 1.14, its capillarity is less than that of

liquid oxygen. It has no absorption spectrum, and is not magnetic. Finally, at $-210^\circ C$. it has no action on dry oxygen, water, or mercury, but it reacts, with incandescence on hydrogen and oil of turpentine.

A modification of M. Moissan's apparatus for preparing fluorine, introduced by M. Meslans, will probably render it possible to include the preparation of the element in the course of ordinary lecture experiments, and may even lead to its economical production on a large scale, if any industrial application of it should be found desirable. The apparatus is of copper, larger than M. Moissan's platinum apparatus, is charged in the usual way, and is then connected with the positive terminal of a battery, the two electrodes being made the negative pole. Fluorine is thus evolved at the internal surface of the apparatus, and a thin, nonconducting layer of copper fluoride is deposited upon it. The apparatus, after this preliminary treatment, is employed in the same way as Moissan's platinum apparatus, but may be simply cooled by ice and salt. The presence of the nonconducting layer of copper fluoride prevents the passage of electricity from the electrode to the side of the vessel, and thus avoids the consequent loss of fluorine, so that the yield in the new modification of the apparatus is much greater than in the original form.

It is observed by L. Gournitsch that the action of electrolysis on the salts of the fatty acids nearly always gives rise to the formation of alcohols, ethers, acids, etc., in quantities variable according to the conditions of the experiment. Iodoform is now prepared electrolytically by substitution, by passing the current through a solution of iodide of potassium in alcohol or aqueous acetone, and neutralizing the excess of potash formed by carbonic acid; the iodine and the potash formed by the action of the current react with the solvent and form crystals of pure iodoform. The nitrified derivatives of the aromatic series seem best for studying the reduction by electrolysis. In 1882 Kendall patented the manufacture of aniline and toluidine by the action of the electric current on mixtures of nitrobenzene and nitrotoluene with concentrated sulphuric acid; but the return was bad, and the process was of no practical value. Twelve years later the subject was again taken up, and it was shown that aniline was formed even in acid solution. The platinum electrodes were strongly attacked in the experiments on carbonate of ammonia, and a complicated platino-ammoniacal base was formed.

In the chrome tannage process, patented by G. W. Alder, the chrome solution is prepared by dissolving potassium or sodium bicarbonate in an excess of sulphuric acid diluted with two volumes of water, reducing the chromium salt by the addition of sugar or alcohol; then neutralizing and precipitating chromium hydrate and "chromium oxycarbonate" by the addition of sodium carbonate, and dissolving the precipitates without filtering by the addition of hydrochloric acid to the mixture. The resulting liquor is supposed to contain chromium chloride, chromium sulphate, sodium and potassium sulphates, sodium chloride, and either formates or acetates of these metals. The patented process of Hugo Schweitzer consists in the reduction on the animal fiber of bichromate of potash by means of hydroxylamine compounds. Sulphoacids of hydroxylamine are produced, whereby the use is permitted of neutral, weakly acid, or weakly alkaline solutions for the second bath is permitted. In the one-bath processes of Robert Wagner and J. J. Maier chrome alum, saltpeter, muriatic acid, salt, and whiting, in proportions which are specified, are mixed with water.

Great interest was manifested at the Toronto

meeting of the British Association in a demonstration by Prof. Andrews of the plaster-of-Paris method of blowpipe work. In this method charcoal is replaced by a thin, oblong tablet of plaster of Paris, mixed with a little boric acid, which can be employed for all the ordinary tests that are conducted on charcoal or platinum wire. Prof. Andrews has further elaborated a series of delicate and characteristic tests for several metals, which depend on the colored films produced when compounds of these metals are treated with a solution of iodine in potassium thiocyanate. The films consist partly of oxide and sulphide, partly of iodide and oxyiodide, and are of very brilliant color. These iodide films afford a ready method for the detection of the constituents of a metal in the field.

Prof. Dewar has devised an apparatus for ascertaining the proportion of any gas in air that is not condensable at about -210°C . under atmospheric pressure, or is not soluble in the liquid air produced; the air to be examined is cooled in a tube immersed in a reservoir, which can be continuously replenished with liquid air boiling under diminished pressure. The gas which does not condense under these circumstances can be subsequently collected and examined, or the liquid portion of the air can be boiled in the condensing tube and the gas collected over mercury. On thus condensing 70 litres of the gas issuing from the King's well at Bath, which Rayleigh had shown to contain 0.12 per cent. of helium by volume, a liquid was obtained which, when boiled, gave off first a gas containing about 50 per cent. of helium. It is concluded that helium is less soluble in liquid nitrogen than hydrogen is in liquid air, and that by proceeding as above helium can be separated from a gas in which it is present to the extent of only one part per thousand. It would seem, further, that hydrogen and helium have about the same volatility.

John J. Sudborough has obtained benzil as one of the products of the action of zinc dust and acetic acid on benzoin. If the action is continued the benzil disappears and the chief product is deoxybenzoin. The formation of an oxidation product of benzoin by the action on it of zinc dust and acetic acid appeared so remarkable that the author has studied the action of acetic acid alone on benzoin, and he finds that small quantities of benzil are formed if benzoin is heated with six times its weight of glacial acetic acid on the water bath for eight or nine hours. Other reactions, especially those of phosphorus pentachloride on various derivatives of benzoin, are studied. The nature of the oily compounds formed has not yet been determined. The author describes a method by which he proposes to find whether they are merely slightly impure forms of the solid compound, true stereo-isomerides, or structurally isomeric with solid compounds.

In manufacturing albumen from duck's eggs at Chin-Kiang, China, the whites, the yolks having been separated, are stirred until they are uniformly mixed and are then dried in shallow tin pans at a temperature of from 40° to 50°C . The drying occupies about seventy hours. Sometimes the albumen is put into vats and allowed to ferment. The process is sometimes hastened by the addition of some chemical. The impurities rise in the froth or settle, and the clear albumen is drawn off and dried. The yolks are stirred through sieves and mixed with salt, borax, etc., and sent to market for leather dressing. Salt borax, acetic acid, ammonia, boric acid, and calcium chloride, are used in the process, but how is not described in the United States consular reports.

Among the new uses found for acetylene, now that it has become so easily procurable, is its employment by H. G. Söderbaum for the quantitative

precipitation of copper in ammoniacal solution, and the separation of copper from metals like zinc, which are not precipitated by ammonia. Acetylene presents the advantage over sulphuretted hydrogen for such use, in that it yields a precipitate that can be filtered and washed very rapidly, and which does not easily become oxidized and pass into solution. The washed precipitate is finally decomposed by dilute nitric acid, the solution is filtered and evaporated to dryness, and the residue is ignited and weighed as oxide.

For drying substances, like soap and wool pulp, C. C. Parsons recommends an oil bath, putting the substance directly into the hot oil, and weighing before and after the hot oil has driven off the moisture. In practice the best results have been obtained with a straight paraffin oil, with a high fire test—in order that the oil may be so freed from volatile matter—that none of it will be carried off with the moisture in the substance to be dried. Ordinarily the whole operation may be completed in twenty minutes.

The use of coke is suggested by H. W. Clarke as a more efficient material than sand for the removal of iron from certain classes of waters. The results of experiments made in Provincetown, Mass., are cited in favor of the efficiency of the method. For removal of iron from a water which does not yield to simple aëration and filtration Lewis M. Bancroft recommends the use of iron and alum.

A method of coloring crystals of haloid salts of potassium and sodium by purely chemical means, through the action of the vapor of those metals upon them, has been found by Giesel. The color is readily developed by heating in a close tube, and is independent of the particular metal employed. The heated potassium bromide and iodide are colored deep blue, potassium chloride dark heliotrope, and sodium chloride yellow to brown. The color appears to permeate the whole crystal, and is permanent in the air and also in water so long as the crystal is undissolved. The solution is colorless and gives a colorless residue. On heating the color disappears.

The indigo prism, used for the detection of potassium by the flame test, is defective because it transmits the red rays given by lithium, strontium, calcium, and barium compounds, as well as those of potassium salts. An instrument invented by Mr. S. G. Newth, is, however, opaque to the red rays of lithium, strontium, calcium, and barium, while it is transparent to those of potassium salts.

In the Seyfert process for making artificial silk from cotton yarn, the cotton is treated with a cold solution of caustic soda, and then dried on a stretcher reel, under strong tension. The yarn is afterward thoroughly washed and dried. The new artificial silk is very strong and noninflammable; and it is claimed that washing does not injure its luster.

A thermochemical method is proposed by Berthelot, by means of which the equivalent of an acid or a base may be determined, even when the compound is of unknown composition.

Atomic Weights.—The results of 64 determinations of the atomic weight of tungsten from the trioxide, made by W. L. Hardin, show a maximum deviation of one and a half unit—from 183.55 to 184.87. The author believes that a discussion of these results, with a view of arriving at the true atomic mass of tungsten, would be useless, that to take the mean of all the results would be unsatisfactory, and that there seems to be no reason why one result should be accepted in preference to any other. It is added that nothing definite was established in regard to the occlusion of hydrogen by the metal. The results obtained by cooling in a vacuum were

practically the same as those reached when the metal was cooled in hydrogen. It was shown in the observations that tungsten attacked the vessels in which the determinations were made, that the oxidation of the tungsten was either slightly volatile, or that a small portion was carried mechanically by the water formed in the reductions, and that the supposed trioxide of tungsten contains nitrogen, and probably hydrogen. "In view of these facts and of the fact that more than 150 determinations have been made of this oxide and nothing definite established, it is evident that the method usually employed in determining the atomic mass of tungsten must be regarded as unsatisfactory."

The atomic weight of tellurium has been identically determined at 127.6 by Brauner, working with the element in combination with metals; Masumi Chikasige, using specimens occurring in native sulphur of high purity, except for the presence of tellurium and selenium; and by Standenmaier, working by an entirely different method from Brauner. The occurrence of tellurium in Japan in association with selenium in native sulphur is noticed by Mr. Chikasige as a fact of great significance in settling the place of this substance in a natural classification of the elements, showing, as it does, so close a habitude existing between the three elements.

A. Scott remarks upon the unsatisfactory nature of the experimental evidence on which the determinations of the atomic weight of carbon rest; erroneous determinations of the expansion produced by the absorption of carbonic dioxide by potash solutions have been employed. When this and other sources of error have been allowed for, the recalculated values of the atomic weight of carbon are 12.008 from the combustion of carbon and 12.050 from the conversion of the monoxide into the dioxide.

By operating on products strictly pure and employing methods free as possible from error, M. Wronbolloff and A. Verneuil find an atomic weight for cerium, of whatever origin, very close upon 92.7. Considering the indirect character of the method employed, this figure can be considered only as approximative to about 0.2 or 0.3.

The values $Ni = 58.69$ and $Co = 58.93$ have been obtained for the atomic weights of nickel and cobalt from analyses of the very carefully dried and purified bromides of those metals. The separate determinations are represented as having agreed admirably among themselves.

Using the process of the oxidation of the double ammonium oxalate, Prof. Brauner has obtained as the atomic weight of thorium 232.5 ($O = 16$), a number considerably lower than that obtained by Cleve.

In their revision of the atomic weight of magnesium, T. W. Richards and H. G. Parker, with four series of determinations, get results in their final experiments that agree surprisingly with Mari-gnac's value obtained from work upon magnesian oxide and sulphate. They make the value $O = 16$, $Mg = 24.962$.

Joseph Gillingham Hibbs, in his estimates of the atomic weight of nitrogen, finds as the mean of the values given by potassium and sodium nitrates 14.0003.

The atomic weight of arsenic is determined by the same observer, using the hydrogen-chloride method of experiment, as 74.9158.

Chemical Analysis.—In the residual and secondary products resulting in the manufacture of beet-sugar raffinose, by crystallizing with the sugar and modifying its form and increasing the specific rotation, has long caused serious and unexplainable errors. Numerous methods have been proposed for

the isolation of this substance, of several of which W. E. Stone and W. H. Baird have found a combination that has proved successful. From the results of its application the authors conclude that raffinose occurs in appreciable quantities in the juice of the American beet. Certain peculiarities in the crystallization of mixtures of sucrose and raffinose are pointed out in the paper of the authors, who find, when examining crystals under the microscope, that frequently solutions containing apparently but a very small amount of raffinose will completely crystallize into forms that can hardly be distinguished from pure raffinose. This modification of crystalline forms seems to afford a ready means of detecting the presence of small amounts of raffinose.

A very convenient mineral ferment for the destruction of organic matter in toxicological research is described by A. Villiers as produced by the aid of salts of manganese. The material to be treated is placed in a flask with dilute hydrochloric acid. Add a few drops of a solution of a manganese salt and a little nitric acid, which must be renewed as it becomes used up. The mixture must be gently heated. The gases produced are carbonic acid and nearly pure nitrogen, and no disagreeable odors are evolved. Such materials as liver, lungs, etc., are dissolved in a few minutes; muscular fiber takes about an hour, and a fatty mass, seeming to contain products of substitution, remains resisting the oxidizing action of the mixture.

The adoption of albumen in several industries as a clarifier has brought a number of different brands into the market. Some of these can be used with confidence, but others are carelessly made, and even adulterated. Some samples have been found by P. Carles to contain from 12 to 25 per cent. of insoluble coagulated matter, having no clarifying power; gum, dextrine, and gelatin are also used as adulterants. The solution of albumen in water should be transparent if free from coagulated particles. When treated with tannin solution, bitartrate of potash, and grenatine, pure albumen solution should show no change. If the grenatine gives a precipitate, it shows tannin is in excess, and that the albumen is adulterated with some inert body or is overheated in making. If, however, the tannin gives a precipitate in the test tube, it proves the presence of gelatin in the sample.

In samples of fire damp examined by M. H. Le Chatelier for the determination of its chemical composition, the incombustible parts varied from 3.1 per cent. to 44.4 per cent. in volume, and contained from 0 per cent. to 4 per cent. of carbonic acid, 0 per cent. to 0.9 per cent. of oxygen, and 2.2 per cent. to 39.8 per cent. of nitrogen. Nitrogen is invariably present in quantities varying from 0.74 per cent. to as much as 30 per cent. In all cases the nitrogen contained argon, varying in proportions from 0.74 per cent. to 3.28 per cent. of the total nitrogen and argon together. It was concluded that argon in fire damp is not derived from the coal, but is only probably present in fossil air of the Carboniferous period, either absorbed directly or carried in by water.

In a study of the very volatile portions of petroleum obtained by distilling the crude product during the cold winter months the different hydrocarbons were identified by converting them into their chlorine substitution products—an object which was effected by bringing the vapor of the hydrocarbon product together with chlorine. It was found that the petroleum contained no normal butane, but iso-butane; that in isolating the octanes a long series of distillations had to be carried on to obtain pure products, the octanes not beginning to accumulate with any degree of purity until the

twentieth distillation. The petroleum contained no octane boiling above 125°. The distillations in some cases proceeded from the heat of the atmosphere, and were regulated by cooling the still.

As a simple and rapid test whereby chlorine, bromine, and iodine may be recognized with certainty in their organic combinations, J. H. Kastler and W. A. Beatty describe a method by heating such compounds with a mixture of silver and copper nitrates, whereby the organic matter is oxidized and any halogen present is held back by means of silver. The authors have obtained excellent results with this test, and claim for it the advantages of rapidity and certainty; that it makes it possible to determine at a glance which halogen is present; that only very small quantities of the substances are required for its application; and that the reagents needed may be obtained free from halogens without difficulty.

In George Heid's method for determining carbon in iron the sample is treated with copper ammonium chloride and the separated carbon is collected on an asbestos filter, where it is washed successively with water, alcohol, and ether; it is then dried in a crucible and weighed. A stream of oxygen is led into the crucible, which is heated over a Bunsen flame, and the carbon is burned off. The difference in weight is the total carbon. The graphitic carbon is obtained by dissolving the iron in dilute hydrochloric acid, and determining the separated carbon as before.

Experiments by MM. Berthelot and B. André upon the decomposition of sugars under the influence of acids, and especially with production of carbonic acid, were partly conducted in sealed tubes at 100° C., and partly in open flasks at the boiling point. Estimations were made of carbonic acid, carbon monoxide, formic acid, levulinic acid, humic acid, and unattacked glucose. Besides glucose, experiments were carried on with levulose, galactose, and maltose. The principal reaction appears to be the formation of humic acid; carbonic acid is also formed in not inconsiderable quantity.

Coloring matters of coal in white wines are distinguished from those of caramel in the process of Alb. d'Aguiar and W. da Silva by the fact that the colors of caramel give, by the usual treatment with amylic alcohol, results very doubtful and sometimes negative, while the coal-tar yellows present a group of very distinct and characteristic colors.

Miscellaneous.—Dr. A. J. Ewart has found that colored bacteria under certain circumstances possess the power of evolving oxygen in greater or less amount. In some the oxygen appeared to be absorbed from the air by the pigment substance excreted from the bacteria. The author did not consider the process a vital one. The substances contained in an alcoholic extract were found to have the same power, though less marked, of excluding oxygen, but the property was soon lost. The purple and green bacteria, in which the pigment forms an integral part of the bacterial plasma, when exposed to radiant energy showed a very weak evolution of oxygen, continuing, under favorable conditions, for an indefinite period. The assimilatory "pigments" are, according to the color, "bacterio-purpurin" and "chlorophyll." The process in this case is a vital one, and the oxygen evolved is apparently derived from the assimilation of carbon dioxide.

Experiments made under the direction of the United States Department of Agriculture to determine in what way the humus of soils influences the nitrogen contents of cereal crops have shown that oats grown on soils rich in vegetable mold contain a larger percentage of nitrogen both in the grain and in the straw than that grown in other soils. The increase was largely in amide nitrogen,

while the percentage in proteins was not greatly augmented, and is therefore not so interesting from an economical as from a chemical point of view. The experiments were suggested by the observation of a large increase in the nitrogen in sugar cane grown in the muck soils of Florida. Since these soils are rich in nitrogen, while they are deficient in nitrifying organisms, the conclusion is drawn that at least a part of the excess of nitrogen which they contain is assimilated directly from the vegetable mold without previous oxidation to nitric acid. The addition of phosphatic fertilizer tended to diminish the actual percentage of nitrogen in the crop harvested.

Thomas slag, or that resultant from the basic Bessemer process, is considered by F. E. Thompson a mixture of chemical compounds, and is regarded as but slightly inferior as a fertilizer to dissolved bone or phosphate rock, and as superior to all insoluble phosphates. Its value as a fertilizer is increased if it is exposed to the weather several years before grinding; but it may be ground as soon as it is cold. The fertilizer value depends on the quantity of phosphoric acid present and on its condition.

In experiments by Prof. C. E. Mabery and L. Goldsmith on the influence of varying quantities of alum on the peptic digestion of blood fibrin the digestive action was retarded in every case by alum, even when it was present in very small quantity. In order to test the action under actual conditions, two loaves of bread were prepared, one with alum baking powder and the other with cream-of-tartar soda powder. Peptic digestion was retarded after taking the bread containing alum. While retardation also took place in experiments made with salicylic acid, boric acid, and formalin, the effect was slight compared with that produced when alum was used.

From experiments on the action of water of various degrees of purity upon lead pipes, C. Antony and T. Benelli have found that the greatest solvent action was with distilled water, and more when saturated with air, while aeration with carbon dioxide retarded the action one half. Water containing calcium or sodium sulphate had about half the solvent power of pure air, and its action was retarded when carbon dioxide was present. Aeration with carbon dioxide, on the other hand, nearly doubled the solvent power of bicarbonate of lime, which without it was only about one fourth that of pure water. Common salt also had little action except when carbon dioxide was present, and seemed often slightly to diminish the solvent powers of other salts. The results, reported in the *"Gazzetta Chimica Italiana,"* are somewhat at variance with the generally accepted ideas.

The antiseptic powers of formic aldehyde, commercially known when dissolved in water as "formalin" or "formol," are described by Dr. Winter Blyth as "extraordinary." One part in 10,000 suffices to preserve milk, soup, and similar articles for a considerable time; and this fact suggested that it might have true disinfecting powers. The aqueous solution called formalin does not give very satisfactory results when exposed in open dishes, as it has the peculiar property of changing by polymerization into a white solid substance, which is far less efficient as a disinfectant. It has been found, however, that when the gas is dissolved in a solution of calcium chloride and afterward heated under pressure, practically dry formic aldehyde is driven off. A comparative trial under similar conditions with sulphurous acid, employing the method commonly used for disinfecting with sulphurous acid, lasting nineteen hours, gave the results: no growth under either disinfectant of diphtheria bacillus, and no growth of typhoid bacillus and anthrax bacillus un-

der formic aldehyde, while the growth of both bacilli under sulphurous acid was good. After the experiments the formic-aldehyde room could be entered with but little inconvenience in a very short time, while an hour was required to make the sulphurous-acid room habitable. Dr. Blyth considers formic aldehyde greatly superior to sulphurous acid as a disinfectant.

In the investigation of the behavior of bacteria toward chemical reagents, by T. Paul and B. Krönig, a definite number of organisms were exposed to the action of a solution of the disinfectant for a definite time; the disinfectant was then completely removed, and the number of organisms still capable of development was determined. The spores of the anthrax bacillus were used in most of the experiments. The different salts of a metal possessing a specifically poisonous character, as, for instance, those of mercury, were found to be very unequally deadly. Other things being equal, those salts most fully susceptible of electrical dissociation are the most active. A solution of mercuric chloride contains many more mercuric ions than a mercuric-cyanide solution of the same concentration, and is correspondingly more deadly. The disinfecting power of a solution of mercuric chloride is greatly diminished by the addition of sodium chloride, a fact of importance in view of the frequent addition of salt to mercuric-chloride solutions to increase their solubility. Similar results are obtained with silver salts. The disinfecting power of solutions of bases or of acids depends, on the whole, on their strength—that is to say, on their degree of electrolytic dissociation. The specific action of the anion and of the undissociated molecule is, however, not to be neglected. Silver nitrate shows the greatest disinfecting power when dissolved in 50-per-cent. alcohol and mercuric chloride in 25-per-cent. alcohol. Solutions of these salts in absolute alcohol are practically without effect on anthrax spores.

In a discussion on "The Teaching of Chemistry," in the International Congress on Technical Education, at London, Dr. Otto N. Witt, of Berlin, said that he could not admit any fundamental difference in the methods of research of pure and applied chemistry, consequently he could not admit the necessity of a difference of instruction for the two. A well-organized instruction in pure chemical science would be the best preparation of any young chemist for his future career. Schools for producing specialists are not wanted; specialism comes as a matter of course in later life. Chemists are needed who embrace their science as a whole, and who are incapable of separating practice from theory or theory from practice.

In their experiments on the direct union of carbon and hydrogen Messrs. Bone and Jordan found that at a temperature of 1,200° C. or thereabouts carbon unites directly with hydrogen to form methane, while no acetylene or other unsaturated hydrocarbon is found at this temperature; that when the electric arc is produced between carbon terminals in an atmosphere of hydrogen methane and acetone are to be found. On continuing the passage of the arc a state of equilibrium between hydrogen, methane, and acetylene is finally established; and that the same state of equilibrium is produced when the electric arc is passed in an atmosphere of either methane or acetylene under similar conditions.

By fractional distillation of pentane from American petroleum, S. Young and G. L. Thomas have obtained pure normal and iso-pentane, the boiling points of which under normal pressure are 36.3 and 37.95 F. respectively. The critical data of normal pentane (temperature, pressure, and volume) as

found by Mr. Young are 197.2°, 25.100 millimetres and 4.303 cubic centimetres; the thermal and other data obtained lead to the conclusion that in the liquid state and at the critical temperature the molecules of pentane are simple ones, as in the gaseous state.

M. Berthelot has found that sulphuric acid absorbs hydrogen completely at 250° C., and even in the cold. During two months, 75 per cent. of the hydrogen present was absorbed, with production of a corresponding amount of sulphur dioxide. This reaction does not take place with the diluted acid. A thermochemical study shows that the dilution of the acid changes the thermal sign of the reaction.

Investigations by Prof. F. H. Storer, of the Bussey Institution, on some of the chemical substances in the trunks of trees show that other substances besides starch are stored up in large quantities as reserve food material in the winter, to be converted into sugar in the spring.

The investigation of the formation of organic bases by plants of the orchid family, begun by M. de Wildemann, has been continued and extended by Dr. E. de Droog. Of the 104 species of orchids examined nine are regarded as producing alkaloids, some in all their parts, and others locally. The function of these alkaloids is believed to be defensive.

The useful products obtained from garbage, where utilization processes of disposal are employed, are, according to W. E. Garrigues, grease and tankage. Grease is used chiefly in the manufacture of glycerin and candle stock, but makes only a very poor soap. Three methods of extraction are in use: By steam, by means of sulphuric acid, and by the use of naphtha. Tankage is used by manufacturers of fertilizers.

The results of studies of the presence of tin in canned goods by J. R. K. Cowan confirm those of previous investigators of the subject. Tin was found present in every can examined, in quantities of from 60 to 150 milligrammes per kilogramme. Granting that this tin is present in a form that can be acted upon in the human system, and considering the large consumption of canned goods, it seems to follow that tin is less toxic than has been supposed, and that it can not be a cumulative poison. The presence of lead was not detected in any instance.

M. C. Friedel, remarking upon the analysis of some fatty matter found in an Egyptian tomb at Abydos, consisting chiefly of palmitic and stearic oxide, and doubtless the tallow of beef or mutton, observed in the French Academy of Sciences that it was interesting to find that the fatty acids, and even their glycoerides, have been capable of preservation for thousands of years. Among the substances found in the small vases were pulverized lead sulphide mixed with a quantity of fatty matter, evidently a cosmetic used as antimony sulphide is still employed in the East.

The sanitation of the manufacture of matches with white phosphorus is regarded by M. Magitot as a problem simple and easy of solution. The method of sanitation contemplated by the author consists of two orders of means based on the two factors of injury, which are phosphorism and necrosis. To phosphorism he would oppose the ventilation of the work by artificial means, powerful enough to withdraw the poisonous emanations from the workers. To necrosis he would oppose the principle of selection: that of recruitment and maintenance from the hands of persons entirely free from any injury of the mouth or the jaws which might furnish an opening for the chemical mischief.

While the carbides obtained from the alkaline earths acting with water produce acetylene, some

other metallic carbides, like those of aluminum and beryllium, give methane, and others, like those of chromium, molybdenum and titanium, are not acted upon at ordinary temperatures. M. Moissan, having prepared uranium carbide, C_2U_3 , finds that, while it does not differ to any marked extent in its other general chemical and physical properties from other substances of the same class, it gives with water a complex series of solid, liquid, and gaseous hydrocarbons. Of these, only the gaseous compounds have been completely examined. They give from 13 to 15 per cent. of hydrogen, from 78 to 80 per cent. of methane, from 5 to 7 per cent. of ethylene, and a trace of acetylene. The author ascribes the presence of the hydrogen to a secondary reaction depending on the power of the lower oxide of uranium to decompose water, and that of the acetylene to the existence of a little calcium carbide as an impurity.

The scope of the work of Dr. L. Marchlewski on "The Chemistry of Chlorophyll" is limited to the consideration of the phase of chlorophyll as a green compound capable of dyeing green. It is not, however, as the author shows, a unitary coloring matter, but a mixture of two pigments with a fatty acid. Pure chlorophyll—that is, the substance which is extracted by alcohol from the green parts of plants—has not yet been isolated. The substance called pure crystallized chlorophyll described in chemical literature consists probably of derivatives of pure chlorophyll. Foremost among such derivatives stands chlorophyll as obtained by the action of weak, especially organic, acids upon chlorophyll. By treatment with stronger acids it is transformed into phylloxanthin and phyllocyanin, which have recently been studied by Schunck. Phyllocyanin, again, by treatment with concentrated acids or by alkalies, is transformed into phylloaenin, the best characterized derivative of chlorophyll. The original unmodified chlorophyll may be transformed by alkalies into alkylchlorophyll, and this, on treatment with acids in the presence of alcohol, yields an alkylether of phylloaenin. On heating phylloaenin with alkalies at a high temperature we obtain phylloporphyrine. Each of these products is described in full in the book, with the method of its preparation, its properties, its chemical composition, its spectroscopic behavior, and its fission products.

It is found by M. E. Vigouroux that the alkali metals, zinc, aluminium, lead, tin, antimony, bismuth, gold, and silver dissolve silicon more or less, but do not combine with it directly. Iron, chromium, nickel, cobalt, manganese, copper, and platinum, on the other hand, form definite silicides.

In his investigations of the physiological chemistry and coagulation of milk, Dr. D. Fraser Harris has found that the small globules, as well as the large, contain fat in direct, and "caseinogen" in indirect proportion to their size. Milk that was heated nearly to boiling point gave the best results with artificial digestion.

The combustion of acetylene in an ordinary fish-tail burner is, according to M. N. Grehant, complete, not the least trace of a combustible gas containing carbon being found in the products. With mixture of acetylene and air, the most violent explosion was produced in the author's experiments, when the volume of air was nine times that of acetylene.

CHILI, a republic in South America. The Constitution is modeled after European parliamentary government rather than the system of the United States that other South American countries have copied. The legislative power belongs to the national Congress, consisting of a Senate and a House of Deputies. The Senate has one third as many

members as the House of Deputies, in which each province is represented by as many members as there are multiples of 30,000 in the number of its population, with one additional member for a fraction over 15,000. Senators serve six and Deputies three years. Every adult male citizen who can read and write has a vote. The proportion of electors is about 1 in 18 of the population. The President is elected for five years by an electoral college chosen by ballot. The President elected on Jan. 25, 1896, is Federico Errazuriz. The Cabinet at the beginning of 1897 was composed as follows: Premier and Minister of the Interior, A. Zanartu; Minister of Foreign Affairs and Worship, H. de Patron; Minister of Justice and Public Instruction, A. Itaque; Minister of Finance, F. Fabre; Minister of War and Marine, M. Bulnes; Minister of Industry and Public Works, Francisco Baiza.

Area and Population.—The area of Chili is 293,970 square miles. The population at the beginning of 1895 was estimated at 2,492,687, on the basis of the imperfect census of 1885. The corrected official estimate is 3,413,576, including 50,000 Indians. The Chilians are mostly of pure Spanish descent. Immigration is encouraged by the Government, which appropriated \$67,000 pesos for the purpose in 1895. The number of immigrants is small, however, numbering from Jan. 1, 1894, to July 31, 1895, only 871, consisting of Italians, French, Spanish, and a few Germans and English. The number of marriages in 1895 was 14,779; of births, 110,154; of deaths, 92,197; excess of births, 17,957. Education is furnished free by the Government. The university and professional schools had 1,490 students in 1894, the provincial colleges 8,710 in 1895. There were in that year 1,248 primary schools, with 2,145 teachers, 114,565 enrolled pupils, and 71,901 in average attendance.

Finances.—The revenue in 1894 was \$3,436,000 pesos, and the expenditures 78,482,000 pesos. For 1895 a revenue of 77,354,000 pesos was counted on, and for 1896 it was estimated at 91,010,000 pesos, and expenditure at \$6,989,000 pesos (1 peso = 91.2 cents). For 1897 the estimate of revenue is 79,200,000 pesos, of which 22,500,000 pesos come from import duties, 38,600,000 pesos from export duties on nitrate, 14,000,000 pesos from railroads, 1,500,000 pesos from sales of public property, 1,000,000 pesos from posts and telegraphs, 550,000 pesos from stamps, 400,000 pesos from rentals, etc., 250,000 pesos from the export duty on iodine, and 400,000 pesos from miscellaneous sources. The expenditures for 1897 were estimated at 79,155,971 pesos, of which 20,013,340 pesos are for public works and industry, 18,035,083 pesos for finance, 11,864,456 pesos for war, 9,348,000 pesos for justice and public instruction, 8,905,713 pesos for the interior, 8,546,983 pesos for marine, and 2,442,896 pesos for foreign affairs, worship, and colonization. The foreign debt on Dec. 31, 1895, amounted to £13,539,760. There was an internal debt, including municipal loans of 36,624,581 pesos. A new loan of £4,000,000, bearing 5 per cent. interest, was raised in London in July, 1896, to build railroads and public works.

The Army and Navy.—The law of Nov. 22, 1895, fixed the strength of the regular army at 9,000 men, organized in 9 infantry, 8 cavalry, and 5 artillery regiments, and a corp of engineers. The militia system was reorganized in 1896, and every able Chilian between the ages of twenty and forty is enrolled in the National Guard. About 25,000 men a year thus receive some military training.

The Chilian navy consists of 4 iron-lads, 5 protected cruisers, an efficient torpedo fleet, and 13 small cruisers and gunboats. The most important are the powerful first-class cruisers "Femoralda," launched in 1896, and "Congress," built in France.

There were 2 second-class cruisers building in 1897. The fastest cruiser "Esmeralda" has a coal capacity of only 550 tons, but is engaged for a speed of 23 knots and has as formidable a battery as any cruiser twice her size. The new second-class cruisers "Presidente Errazuriz" and "Presidente Pinto," built in France, have a displacement of 2,080 tons and a speed of 19 knots. The cruiser "Blanco Encalada," built in England to replace the vessel of that name which was sunk in the civil war, has a displacement of 4,500 tons and a speed of 22 knots. The torpedo fleet comprises 4 new destroyers, constructed in England, 5 first-class and 8 third-class torpedo boats, and some smaller ones for harbor defense.

Commerce and Production.—About half the population is supported by agriculture. The wheat crop is about 28,500,000 bushels a year. Over 500,000 cattle and 2,000,000 sheep are raised annually. Chile is an important mining country, producing 400,000 quintals of copper, 160,000 quintals of silver, 500 kilogrammes of gold, and 10,000,000 tons of coal every year, with manganese and minor products. Most important of all is the nitrate industry. The nitrate fields, embracing 89,177 hectares, are estimated to contain 2,316,000,000 quintals of nitrate. The product was 1,082,285 quintals in 1894. The total value of imports in 1894 was 54,483,616 pesos; of exports, 72,040,420 pesos. Of the former sum 12,058,135 pesos represent articles of food, 10,438,528 pesos raw materials for manufactures, 9,150,441 pesos machinery, 7,352,791 pesos textile manufactures, 3,223,041 pesos domestic articles, 2,629,262 pesos railroad materials, 1,899,417 pesos articles of clothing and personal adornment, 892,820 pesos wines and beverages, 891,311 pesos objects of art and taste, 686,222 pesos drugs, 4,727,477 pesos miscellaneous merchandise, and 489,171 pesos specie and bank notes. The exports of nitrate were 44,727,513 pesos in value; iodine, 3,332,780 pesos; other minerals, 13,265,987 pesos; wheat, 3,302,014 pesos; other agricultural produce, 5,798,032 pesos; manufactures, 36,223 pesos; miscellaneous merchandise, 341,442 pesos; specie, 529,068 pesos; foreign exports, 707,361 pesos. Duties were imposed on 34,007,263 pesos worth of the imports and 48,060,293 pesos of exports. Of the exports of nitrate 39 per cent. goes to Germany, 17 per cent. to France, 13 per cent. to the United States, 11 per cent. to Great Britain, 11 per cent. to Belgium, and 9 per cent. to other countries.

The division of the foreign trade among foreign countries in 1894 is shown in the following table, giving the value of imports and exports in pesos:

COUNTRIES.	Imports.	Exports.
Great Britain	25,491,859	53,255,112
Germany	12,376,327	9,672,403
United States	3,784,456	1,067,745
Peru	3,537,430	1,479,820
France	2,281,334	2,002,852
Argentine Republic	4,169,891	59,969
Italy	556,341	176,487
Brazil	140,053	117,545

Navigation.—The number of vessels in the foreign trade entered at Chilean ports during 1894 was 1,761, of 2,269,860 tons; the number cleared was 1,681, of 2,555,540 tons. The tonnage entered in the coasting trade aggregated 6,254,836. The commercial marine on Jan. 1, 1895, comprised 146 sailing vessels, of 75,711 tons, and 42 steamers, of 29,931 tons.

Communications.—The railroads of Chili in 1894 had a total length of 1,782 miles, of which the Government owned 686 miles, and 600 miles will revert to the Government. The capital expended on Government lines was 64,459,179 pesos, and on

aided lines 13,080,832 pesos. There were 436 miles of new railroads in process of construction in 1895.

The Government telegraph lines had a total length of 6,965 miles on Jan. 1, 1895, with 8,330 miles of wire. The number of dispatches in 1894 was 1,044,065. Railroad and telegraph companies had 4,500 miles of telegraph lines.

The postal traffic of 1894 comprised 22,249,296 letters, 2,092,672 circulars, and 28,537,020 newspapers, etc.; receipts, 849,139 pesos; expenses, 894,688 pesos.

Political and Financial Affairs.—At the beginning of 1897 a general improvement was noticeable in the commercial situation, and a return of confidence that had been wanting since the revolution of 1891. The conversion of the paper money had a favorable influence, especially on the foreign community, although some of the landowners had been obliged to sacrifice their property. The settlement of all the remaining English claims arising out of the revolution removed a source of irritation both to the waiting claimants and to the Chileans, who felt annoyed that foreigners, owing their fortunes to the favorable conditions of the country, should demand compensation from the Government which no Chilean could claim for like injuries. The vexed question of frontiers with the Argentine Republic made marked progress toward an amicable settlement. By the treaty of April, 1896, any dispute arising between the commissioners engaged in marking the boundary line was to be referred to the Queen of England for arbitration. Although the people of each country held tenaciously to their different interpretations of the old boundary treaty, they were disposed to rely on the award of jurists rather than appeal, as they were wont, to the arbitration of war to bear out their pretensions. The new war ships arrived from England made Chili once more the chief naval power of South America. Both exports and imports had been increasing, and considerable foreign capital was brought into the country. This recovery, however, was of short duration. Before a third of the year had passed stagnation in business and contraction of credits ensued, and the Government had to face a probable deficit. The owners of the nitrate mines had ceased shipping for three months, on account of the low price in Europe, which was due partly to overproduction and partly to a decrease in consumption, the place of nitrates being taken in Europe and the United States by artificial manures. As the export duty on nitrates has furnished half the revenue of the Chilean Government, it created embarrassment when this source of income was cut off altogether. To aid in discovering new outlets for this product, the Government remitted the duty on cargoes sent to China and Japan, sent special agents to the United States, and promised to spend \$75,000 a year or more in making its usefulness known in fresh markets. A new commercial treaty was concluded with Brazil in May. By the conversion law all bank notes were to be withdrawn before the end of the year. As a serious restriction of the circulating medium was feared, the Minister of Finance proposed to Congress to allow banks to issue notes against deposits with the Government of 20 per cent. of their face value in gold and 80 per cent. in bonds, while the Government should undertake to redeem any of these notes on demand in gold.

When Congress was opened on June 1 the President of the republic said that there were ample funds to meet the estimated deficit of \$6,000,000. The budget for 1898 showed a prospective surplus, expenditure being cut down by \$3,000,000 to \$79,100,000, while revenue was calculated at \$79,700,000, an increase of \$3,700,000. The currency conversion was already practically completed, the state

notes alone remaining unredeemed. The banks had reduced their debt to the Government from \$34,000,000 in November, 1896, to half that amount. The economic crisis was attributed to want of capital. Just as the congressional session began four of the banks closed their doors. On June 20 the ministry resigned, and five days later a coalition Cabinet was formed by Señor Orrego Luco, in which the Liberal element largely predominated. It was composed as follows: Minister of the Interior, Augusto Orrego Luco; Minister of Foreign Affairs, Carlos Morla Vicuña; Minister of Finance, Juan E. Tacornal; Minister of Justice, Amunátegui Rivera; Minister of War and the Navy, Benjamin Vergara; Minister of Industry and Public Works, B. Prats.

Owing to the balance of parties, the new Cabinet was not a strong one. It promised to follow in the main the policy of its predecessors, and, above all, to maintain the conversion, to which the good faith and credit of the country were declared to be bound. The banking crisis had led to many foreclosures, and a great fall in the value of property was experienced. With the falling off of imports, and the consequent loss of duties collected from them, and the large decrease of nitrate duties, a deficit of at least \$8,000,000, instead of a surplus, was anticipated at the end of the year. On Aug. 9 the ministry resigned. Valdes Cuevas organized a new one, composed of Liberals, which promised to maintain the conversion and to protect national industries.

CHINA, an empire in eastern Asia. The Government, as defined in the collected regulations of the Taing dynasty, is based on the Government of the family. The Emperor exercises supreme paternal authority. The acts of the Government are largely regulated by precedents extending back thousands of years. The chief governmental body is the Grand Council. The imperial administration is directed by the Cabinet, consisting of 2 Chinese and 2 Manchu members, assisted by 2 members chosen from the Hanlin College, who watch against any contravention of the regulations of the dynasty or the laws of Confucius. Subordinated to the Cabinet are the Boards of Civil Appointments, Revenue, Rites and Ceremonies, Military Affairs, Public Works, Criminal Justice, and the Admiralty, each having a Chinese and a Manchu presiding jointly over it. The Board of Censors, consisting of 40 to 50 learned mandarins with a Chinese and a Manchu at their head, acts as a supreme advisory body, and the censors are privileged individually to present memorials of criticism or remonstrance to the Emperor on any public matter. One censor must be present at all meetings of Government boards. The reigning Emperor is Kwangsu, born Aug. 2, 1872, son of Prince Chun, the seventh son of the Emperor Taokwang, who succeeded his nephew, the Emperor Tsaichun, on Jan. 12, 1875, and reigned under the regency of his aunt and adoptive mother, the dowager Empress Tshui, till March 4, 1889, and then assumed full powers of Government.

Area and Population.—The area of the Chinese Empire is estimated at 4,218,401 square miles, and the population between 350,000,000 and 400,000,000. Official estimates for the provinces of China proper are given in the table above. The dependencies of China are Manchuria, having an area of 362,310 square miles and about 7,500,000 inhabitants; Mongolia, the area of which is 1,288,000 square miles and the population perhaps 2,000,000; Tibet, with an area of 651,500 square miles and an estimated population of 6,000,000; Tsungaria, with an area of 147,450 square miles and 600,000 inhabitants; and Chinese Turkestan, estimated to cover 431,800 square miles, with 580,000 inhabitants. The prevailing religious system

PROVINCES	Area, square miles	Population
Peichin	36,000	1,000,000
Shantung	50,000	30,247,825
Shensi	70,000	12,204,455
Honan	50,000	20,115,807
Kiangsu	41,000	20,000,171
Szechuen	40,000	20,500,000
Kiangsi	40,000	24,000,126
Chih Kiang	30,000	10,000,000
Fukien	30,000	20,100,000
Hubei	30,000	24,000,000
Hunan	24,000	20,000,000
Shensi	20,000	10,000,000
Korea	120,000	10,000,000
Manchuria	360,000	10,000,000
Kwangtung with Hainan	70,000	20,100,000
Kwangsi	70,000	10,000,000
Kweichow	60,000	10,000,000
Yunnan	100,000	11,000,000
Total	1,342,000	300,000,000

is that of Confucius. Buddhism and Taoism are also widely expanded. Islamism counts about 20,000,000 adherents in Yunnan and the northeast. In the mountainous districts are savage tribes of aborigines, who practice nature worship. The Roman Catholic Church in 1881 had 1,002,818 parishioners under the ministrations of 41 bishops, 661 European priests, and 550 native priests. The number of Protestant converts in 1887 was estimated at 33,750. Education is very general. A knowledge of the literary language and the Chinese classics is not general, but is assiduously cultivated by a numerous literary class, for appointments to public office are bestowed on those who pass the annual examinations for literary degrees. Since 1887 aspirants to office and honors have been examined in mathematics as well as in the Chinese language, literature, and laws. There are many schools in which the Western languages and sciences are taught. In the foreign college at Peking, which is supported by the Imperial Government, European and American professors teach English, Russian, French, German, mathematics, astronomy, meteorology, physics, chemistry, anatomy, and physiology. The Government has also established military and naval schools for the training of officers in modern warfare. The number of foreigners residing in the open treaty ports on Dec. 31, 1895, was 10,091, comprising 4,084 British subjects, 1,325 Americans, 875 French, 812 Germans, 805 Portuguese, 669 Japanese, 461 Spaniards, 373 Swedes and Norwegians, 125 Danes, 116 Russians, 108 Italians, 75 Austrians, 71 Belgians, 43 Dutch, and 149 of other nationalities.

Finances.—The revenue is mainly collected by the provincial authorities. The Imperial Government calls upon them to transmit to Peking the surplus over their own requirements, usually making a requisition for a fixed sum from each province calculated on the collections for past years. In national emergencies extraordinary contributions are demanded. When owing to famine or poverty the revenue of a province is insufficient for its own needs the Imperial Government remits the provincial contribution, and sometimes gives assistance out of its own treasury. It is estimated that not more than a third of the surplus revenue of the provinces is actually paid over by the officials to the imperial authorities.

A recent estimate makes the present imperial revenue \$9,979,000 taels, equal to \$14,829,000. The land tax yields a little over 25,000,000 taels, which is believed to be much less than the amount actually collected, which itself is capable of a large expansion. Estimating 300,000,000 acres of land in cultivation, and an average tax of two thirds of a tael per acre, the Government receives only 12 per cent. of the amount collected. The salt tax is yielding some-

thing over 13,500,000 taels, has been slightly increased since the war and could be much further increased. The officials and middlemen connected with the monopoly retain two taels for every one that they send to Peking. The taxes levied in kind known as tribute rice would yield 1,000,000 taels more if greedy officials did not control the transportation. The actual yield is 5,000,000 taels. The revenue from native-grown opium is 2,000,000 taels, two fifths as much as is derived from half the quantity imported from India. The imperial customs yield nearly 22,000,000 taels. From the *likin* the Imperial Government derives nearly 13,000,000 taels, and it is constantly demanding larger remittances from the provincial authorities, causing them to increase the aggravating restrictions on internal trade. Three or four different sets of officials collect taxes from the same goods, and sometimes even compete with each other. English merchants suggest that their Government refuse to accede to the revision of the tariff desired by China, except on condition that all the taxes on trade be consolidated, which the Peking authorities might be induced to agree to, since they could thereby derive a much larger revenue from the internal commerce, exceeding as it does tenfold the foreign commerce of the empire. The total expenditure is taken to be the same as the revenue in amount. The chief items are 36,250,000 taels for the general provincial administration and 19,000,000 taels for the administration of the metropolis, including the expenses of the Manchu garrison and of the imperial household. No attempt is made to adjust taxation or expenditure by means of an annual budget, either provincial or imperial. After the demands of Peking are satisfied the provincial authorities are left to dispose of the rest of the revenue in their own way, the auditing of their accounts in Peking being a mere formality. None of the provinces, in fact, furnishes reports of expenditures. Of the revenue collected by the provincial authorities, including all except the imperial customs, about two thirds are applied to the civil and military expenditure of the provinces. The sums actually paid by the taxpayers are believed to be at least three times as much as ultimately reaches the public treasury, the extravagant system of collection costing as much as the net revenue, and the irregular perquisites retained by the officials absorbing as much more. The gross revenue for 1896, as returned by the Board of Revenue, is much less than the above estimate, amounting to 73,300,000 taels, or about £12,000,000, made up as follows: Imperial maritime customs, 15,500,000 taels; grain and land taxes, 10,800,000 taels; salt *gabelle*, 12,200,000 taels; ordinary taxes on home produce, 2,600,000 taels; *likin*, 13,400,000 taels; various license fees, 3,500,000 taels; miscellaneous duties, 15,300,000 taels. The imperial customs collected amounted to 22,500,000 taels, from which must be deducted the cost of collection, about 10 per cent., and the amount of opium *likin*, etc., paid to provincial authorities.

The maritime customs, under European administration, make annual reports. The receipts for 1895 amounted to 21,385,389 haikwan taels (1 haikwan tael = 81 cents), of which 6,039,582 taels were import duties, 9,025,557 export duties, 1,216,361 taels duties collected from the coasting trade in foreign merchandise, 478,817 taels tonnage dues, 520,927 taels transit dues, and 4,104,145 taels the commuted *likin* tax on foreign opium.

The debt of the Imperial Government previous to the war with Japan consisted of a loan of £627,675 contracted in 1874, one of £1,604,276 borrowed in 1878, silver loans of £1,505,000 and £2,250,000 raised in 1884 and 1886, a German loan of £250,000 borrowed in 1887, and a loan of £1,635,000 in silver

raised in 1894; total outstanding on Dec. 31, 1895, £7,871,951. In 1895 a gold loan of £3,000,000 was raised, and about £2,000,000 more were advanced by foreign houses and £5,000,000 raised by domestic loans. The Japanese indemnities amount to about £40,000,000, making the present indebtedness of the Imperial Government nearly £58,000,000. The Japanese war indemnity was fixed at 200,000,000 kuping taels (1 kuping tael = 73 cents), and 30,000,000 taels more were demanded for the evacuation of the Liaotung peninsula. To meet these obligations the Government contracted a new foreign loan of the nominal amount of £15,820,000 in 1895 at 5 per cent., and in March, 1896, an Anglo-German loan of £16,000,000, also at 5 per cent. The total foreign debt now outstanding is about £38,800,000.

China received from these loans about £30,500,000, and up to 1897 had paid £21,500,000, and had a balance remaining in London of £5,000,000, sufficient to pay the installments due in 1897. Of the £4,000,000 applied to other purposes, £1,000,000 has been expended in the purchase of ships and arms and £750,000 was deposited in the Russo-Chinese Bank as a guarantee that China will fulfill the obligations undertaken in connection with the Siberian Railroad through Chinese territory. The sum still due Japan is £16,450,490, being the equivalent of 100,000,000 taels at the agreed rate of sterling exchange, though the sterling value of that sum after Japan adopted the gold standard fell to £15,000,000. Japan desires that the liquidation should be effected at once, being in need of gold, and China was anxious to clear off the indebtedness by raising a new loan of £16,000,000, because £1,850,000 of interest already paid on the part of the indemnity still due will be refunded if the whole is paid before May 8, 1898, instead of dragging along the payments till 1902. For the projected loan China has offered as security the unhypothecated remainder of the imperial customs revenue, which is £600,000 per annum, and the guarantee of the Board of Revenue. The total foreign indebtedness of the Chinese Government is about £38,500,000. In September a contract was made with a British syndicate for a loan of £16,000,000 to pay the Japanese indemnity, which was taken at 94, and for other loans for the construction of railroads. The indemnity loan is secured on the customs, the *likin*, and the salt revenue. The right of foreign control of the *likin* was acknowledged, but the Chinese Government refused to admit of an extension of foreign administration to the collection of *likin* taxes, as advocated by Sir Robert Hart, chief of the imperial customs, and supported by the British minister. The British and other governments have agreed in principle to the revision of the tariff fixed in 1858 by the treaty of Tientsin. The fall in the price of silver has greatly increased the burden of the foreign debt of China, payable in gold, and the amount of the debt has been enormously swelled by the addition of the war indemnity to Japan. The Chinese Government has therefore asked to be permitted to double the present tariff rates. These rates, owing to the fluctuation in market prices, fall considerably short of the 5-per-cent. *ad valorem* basis upon which the tariff of 1858 was framed, and probably do not represent on an average more than 34- or 34-per-cent. *ad valorem*. Three quarters of the present customs revenue has been mortgaged to secure loans to meet the war indemnity and other expenses connected with the disastrous conflict with Japan, and before the indemnity can be cleared off the remaining portion of the revenue now collected from foreign trade must be pledged.

The Army.—The military forces of the Chinese Empire have two separate organizations. The Army

of the Eight Banners is recruited from the descendants of the Manchus, Mongols, and Chinese who put an end to the Ming dynasty in the seventeenth century, and placed the reigning dynasty in power. The other organization is the Army of the Green Flag, the national Chinese army, raised and maintained by the provincial governments. There are besides a number of small independent corps and the irregular troops that are raised and disbanded according to necessity. The troops of the Eight Banners are cantoned in Peking and 25 neighboring towns in the province of Pechili or garrisoned in the Chinese provinces, Mongolia, and Turkestan. Their effective strength is perhaps 100,000 men, armed for the most part with modern weapons and trained in European tactics. The Army of the Green Flag, the separate divisions of which are commanded by the viceroys and governors of the provinces, has a nominal strength of 539,000 men, but they are almost without military instruction, insufficiently armed, and devoid of military spirit and discipline. Since the Japanese war plans have been adopted for organizing new formations on European models, but no results have been obtained so far beyond the extension of the study of the art of war.

The Navy.—The battle-ships formerly belonging to China, and attached to the northern squadron, were lost in the battles of Yalu and Wei-Hai-Wei during the war with Japan. The naval forces are still, like the national army, organized and controlled by the provincial administrations. The only vessel of the Peiyang or northern fleet now is the torpedo-catcher "Fei-Ying," of 850 tons, built in 1895. The Chinese Government in 1896 ordered 3 protected cruisers to be built at Stettin. The Foo-chow squadron consists of an ironclad gunboat, 6 cruisers, built between 1883 and 1890, 2 armed dispatch vessels, 4 transport avisos, and 2 paddle-wheel gunboats. The Shanghai squadron consists of 2 cruisers, 1 frigate, 5 gunboats, 6 floating batteries, and 3 armed transports. A new cruiser is being built. The Canton squadron comprises 3 torpedo cruisers, built in 1890 and 1891, 16 gunboats, 6 revenue cutters, and 42 torpedo boats, and has in construction 1 swift dispatch boat, 4 gunboats, 2 river gunboats, and 1 torpedo boat. The torpedo boats belonging to the other squadrons number 30 of the first and 13 of the second class.

Commerce and Production.—The Chinese are mostly engaged in agriculture, raising a great variety of products by careful and thorough methods of cultivation. Wheat, millet, corn, barley, and other cereals are grown in the northern provinces and great quantities of rice in the south, where sugar is cultivated extensively also. The tea districts are in the western and southern provinces. The silk culture is widespread, the best silk coming from Kwangtung, Kiangsu, Che-Kiang, and Szechuen. Silk mills have recently been established in Shanghai and Canton and large cotton mills in the former place. Coal, of which large beds underlie the whole of central and northern China, is mined at Kaiping and Han-Kow. Copper mines, which have long been worked in Yunnan, have been developed recently by Japanese metallurgists.

The imports in 1895 amounted to 171,696,715 taels, and exports to 143,293,211 taels, taking the prices in the ports of China. Adding to the value of the exports and deducting from that of the imports the duties and other charges, the value of the imports was 150,244,490 taels, and that of the exports 160,696,753 taels. The chief imports in 1895 were opium, of the total value of 29,164,800 taels; cotton manufactures, 53,074,164 taels; raw cotton, 568,917 taels; woolen goods, 3,723,246 taels; metals, 7,189,409 taels; coal, 3,394,272 taels; kerosene, 6,615,297 taels; seaweed and fishery products, 5,135,-

602 taels. The value of tea exported in 1895 was 32,449,862 taels; of raw silk and silk goods, 50,687,102 taels; of straw braid, 2,494,073 taels; of sugar, 2,129,779 taels; of cow and buffalo hides, 980,944 taels; of paper, 1,986,423 taels; of clothing, 2,189,969 taels; of chinaware and pottery, 1,541,132 taels. The total export of tea was 1,865,680 piculs, having declined from 2,217,265 piculs in 1886.

The amount, in hawkman taels, of the direct trade with various countries in 1895 was as follows:

COUNTRIES.	Imports.	Exports.
Hong Kong	99,191,200	54,114,400
Great Britain	33,960,000	16,211,000
Straits and Singapore	2,500,000	1,880,000
East India	16,944,700	2,358,700
Japan	17,196,000	14,921,600
Manco	3,650,000	1,700,000
Siberia	111,000	11,101,000
European Russia	1,791,192	4,611,641
Rest of Europe	7,552,000	29,112,378
United States	5,000,192	15,998,000
All other countries	3,406,700	5,557,921
Total	179,907,000	163,953,000

From the sum of the imports are to be deducted 8,250,285 taels of re-exports, leaving the total net importation 171,696,715 taels. The imports from Formosa, valued at 8,806,328 taels, and exports to Formosa, valued at 1,700,624 taels, are included in the figures for Japan.

The foreign trade in 1896 reached the total of 333,600,000 hawkman taels, the largest ever recorded. Its sterling value was £55,500,000, against £51,500,000 in 1895 and £46,500,000 in 1894. The increase over the trade of 1895 is due to a gain of over 30,000,000 taels in imports, exports having decreased 12,000,000 taels, owing partly to the loss of the trade of Formosa. British imports increased over 20,000,000 taels. The British share in the total trade increased 9½ per cent, and amounted to 70 per cent, of the whole. The trade of all other foreign countries fell off 1,000,000 taels. This corresponds to the decline in the trade with Continental Europe, while trade with Japan decreased by over 3,000,000 taels. There was a decided improvement in the trade with the United States, which increased more than 2,500,000 taels. Opium imports in 1896 showed a further large decline, owing not only to the loss of Formosa, but to decreased demand throughout China. The trade in textiles was unusually large, and there were very heavy importations of American drills, sheetings, and cotton flannels, due to low prices prevailing in the United States market during the summer. American cottons are specially desired in the cold climate of northern China and Manchuria. Indian yarn imports have risen from 628,000 piculs in 1889 to 1,461,000 piculs in 1896. Japanese yarns rose from 19,000 piculs in 1895 to over 100,000 piculs. There was a remarkable increase in the imports of woolen cloth, especially from India. There was a striking decline in the exports of black tea, due to the disappearance of Formosa shipments and to diminished production throughout China. The export of brick and tablet tea to Russia showed an increase. The shipments of black tea to India likewise increased, as they have steadily done for ten years. There was a decline of 22,200 piculs in the silk exports, attributable to large production in other countries, to certain changes in fashion, and to an intermission of the American demand during the presidential campaign.

The foreign merchants who established themselves in the treaty ports are being gradually crowded out by the Chinese, and while the import trade has continuously increased the native traders are monopolizing in an increasing degree the ad-

vantages obtained under the treaties. The native merchants are subjected to official exactions that foreigners are protected from by treaties, but the demands of the mandarins are limited to what the trade can bear, for if they are too onerous it passes into foreign hands and the source of revenue is closed. The native merchants obtain their goods from the foreign houses in Hong-Kong and Shanghai, in Shanghai the foreign importers are becoming more and more the commission agents of the Chinese importers who supply the manufacturing centers of the West. Thus half the cotton imports are obtained in this way, and the Chinese take the risk of exchange as well as of the market. Of the imports other than cotton and woolen goods three fourths arrive in Shanghai on Chinese account.

The hopes raised by the terms obtained by the treaty of peace with Japan, increasing the manufacturing and trading privileges of foreigners in China, have not been realized. The cotton mills and silk filatures that have been established in the neighborhood of Shanghai are liable, according to the interpretation put upon the Shimonoseki treaty by the Chinese Government, to be impeded by the exaction of excise and *likin* duties on the manufactured products as well as excessive *likin* duties on the raw materials. The treaty distinctly provided that goods thus manufactured by machinery shall, for all purposes of internal taxation, stand on the same footing as imported goods, enjoying the same exemptions "in respect of inland transit and internal duties, charges, and exactions of all kinds, and also in respect of warehousing and storage facilities in the interior of China," as imported merchandise that has paid 2½ per cent., half the customs duty, in lieu of transit duties. The Tsung-li-Yamen, disregarding the treaty stipulation fixing the maximum duty at 2½ per cent., proposed that the goods manufactured in these steam factories at the treaty ports by foreigners shall pay a duty of 10 per cent., 2½ per cent. more than the total duties on imported goods, including 5 per cent. import duty. This 2½ per cent. the ministers thought ought to be added to counterbalance the charges of lighterage, freight, insurance, coolie hire, etc., that imported goods have to bear. Japan was willing, in return for land concessions at certain of the treaty ports, to agree to an interpretation of this clause of the treaty that will permit the Chinese to tax the products of factories as they desire, for the Japanese have repented securing for Europeans the right to establish cotton mills to compete with their own in their best market, with the advantage of abundant cotton at their doors and cheaper labor than in Japan. The Tsung-li-Yamen subsequently decided to levy on the manufactured goods only the same rate of duty that is paid on imports, without interfering, however, with the *likin* imposed on raw material. It is feared that an excessive growers' tax will be placed upon raw cotton sent to these mills in order to maintain the monopoly hitherto enjoyed by the Chinese mills, in favor of which the prohibition against the importation of spindles was formerly enforced by the Chinese Government. The cotton-spinning factories compete at present only with the mills of Japan and Bombay, turning out the coarser kinds of yarns. But there is no reason to suppose that this will continue to be the case, or that the manufacturing industry of China will be confined to spinning alone, and not embrace weaving, or to cotton rather than to wool or silk. Those interested in these undertakings hope from the demonetization of silver in Japan that China will become one of the principal manufacturing countries of the world. It is computed that a Chinese laborer does about half the work of the British operative at one fourth of his wages, and that the wages now paid

in Shanghai are higher than what the operatives can afford to take and hence will not rise, whereas the efficiency of the hands is likely to increase considerably in time.

The Chinese Government is negotiating for the right to increase the present scale of foreign customs duties to enable it to meet its obligations due in Europe, which have become heavier in proportion to the fall in silver. In default of such an arrangement it must increase the export duties in order to obtain the money to meet the heavy liabilities contracted abroad, although some of these specific duties, fixed when prices were higher, are a crushing burden on some of the most important branches of the export trade. The most flagrant instance is the export duty on tea, fixed by the Tientsin treaty of 1858 at 2½ taels per picul, the equivalent at that time to 5 per cent. *ad valorem*, but now a duty of 20 per cent., while the *likin* taxes are at least 20 per cent. more. The total taxation on tea before it leaves the port of export is in many cases not less than 80 per cent. This has greatly assisted the competition of Indian and Ceylon teas in Great Britain, which took only 37,500,000 pounds of China teas in 1896 against 169,000,000 pounds in 1881, and that of Japanese green teas in the American market. The trade in raw silk, of which China no longer enjoys the monopoly, is also crippled, though in a less degree, by the excessive export duty.

The commutation of the *likin* duties, by which the payment to the maritime customs, with the foreign import duty of half its amount additional, exempts goods from all barrier duties in the interior, has in a greater or less degree been evaded by the local authorities. They no longer levy *likin* duties as such on merchandise accompanied by the transit pass, but they exact their equivalent under the names of excise and *octroi* duties. Kerosene oil, for example, has to pay in Canton a municipal tax amounting to nearly 40 per cent. *ad valorem*. The commutation of the *likin* on foreign opium under the Chifu convention of 1886 has been strictly observed by the provincial authorities because Great Britain reserved the right to revoke that convention in case of any evasion of its provisions, and in that event the Pekin government would lose the large revenue that comes from the commuted *likin* on opium. Other merchandise has been practically taxed at the inland barriers the same as before, although the 2½ per cent. duty exempting it under the Tientsin convention from *likin* charges has been paid at the port of entry. The Central Government has not exerted its authority to check these treaty evasions, and has been less disposed to do so since its demands on the provincial treasuries have increased. These abuses have been greatest in the Kwang provinces, where the officials have simply ignored transit passes when in the hands of native merchants and have exacted excessive *octroi* and destination duties from foreigners. Finally, the British minister at Pekin, Sir Claude Macdonald, being desirous of removing obstructions to British trade in this part of China in order to meet the competition threatened by the French Tonquin Railroad, peremptorily challenged the Chinese Government to require the authorities of Kwangtung and Kwangsi to observe the international engagements. Accordingly a proclamation was issued in January, 1897, forbidding officials to collect barrier duties in any form from goods provided with transit passes or any *octroi* or destination duties except such as may be imposed on similar goods which have paid *likin* in transit.

The ports of Hangchow and Soochow, which were to be thrown open to foreign trade by the

terms of the Shimonoseki treaty, have not yet been opened. The opening of the West river was promised to Great Britain in 1895, and an imperial edict was issued declaring it open, but tedious negotiations had yet to be gone through with as to what ports on the river were to be opened and within what limits and under what regulations was navigation to be allowed in foreign bottoms. The West river was at last opened to steamers as far as Woochow-Foo on June 4, 1897. The opening of this water way is the compensation exacted by Great Britain for the cession to France in 1895 of a part of the Kiang-Hung district to the south of the Yunnan province in spite of an engagement made by China when the district was assigned to her by Great Britain under the Burmah frontier treaty that it should not pass to any other power without the consent of the British Government. By the waters of the West river and its tributaries access is obtained to the eastern part of Yunnan, the southern part of Kweichow, the province of Kwangsi, and the western part of Kwangtung, but the part of the river opened to foreign commerce only reaches into Kwangsi for the distance of ten miles beyond the border of Kwangtung province. Besides Woochow the only port opened is Samshui.

The French have been compensated for the opening of the West river to British commerce by receiving permission to extend their Tonquin Railroad to Yunnan-Foo, the capital of Yunnan, by way of Kwangsi. French engineers will be allowed to work the mines near the frontier.

Navigation.—There were 8,956 sailing vessels, of 1,033,670 tons, and 28,176 steamers, of 28,683,408 tons, entered and cleared during 1895. Of the total number of 37,132, of 29,737,078 tons, 19,579, of 20,525,798 tons, were British; 13,014, of 5,220,121 tons, Chinese; 2,684, of 2,442,185 tons, German; 266, of 341,345 tons, French; 108, of 121,691 tons, Japanese; and 92, of 86,427 tons, American.

Communications.—The internal commerce of China is exceedingly large, although roads, canals, and natural water ways afford all the means of transportation, except the railroad originally built from the Kaiping coal mines to deep water on the Petang river and now extended to Tientsin and beyond in the direction of Shan-Hai-Kwan. The extension of the Northern Railroad from Tientsin to Peking was completed in the summer of 1897. A Belgian syndicate, supported by the French and Russian ministers, in return for a 4-per-cent. loan of £4,000,000 sterling, running ninety years and taken at 90 per cent., obtained a concession for the construction of the trunk line from Peking to Han-Kow, on the Yangtse-Kiang. This railroad, to be completed by 1903, is 700 miles in length. An American syndicate also bid for this concession, but could not obtain the contract. The syndicate was to have a hand in the construction of the rest of the projected railroad system of 2,000 miles and to receive a 5-per-cent. commission on all material purchased. Of the material half is to be supplied by China and the other half by tenders from abroad. The other projected railroads were a continuation of the Han-Kow line to Canton, a line from Shanghai to Soochow and Hangchow, and the extension of the Northern Railroad to Kirin and Moukden. The British, German, and American ministers protested against this arrangement as infringing most-favored-nation rights, and consequently the monopoly clauses were not confirmed. British and German capitalists would not invest in the projected system of railroads because they were to be under the control of a Chinese official, while Sheng-Tajen, the Chinese Director General of Railroads, found it difficult to raise 13,000,000 taels of native capital that he promised. The obstacles were

sufficient to prevent the Belgian scheme from going through, and railroad construction, except the Peking-Han-Kow line, was postponed. The Manchurian railroad from the Onon station of the Transsiberian section of the Great Siberian Railroad, through Tsitsihar, Kulanchen, and Nangtchen, Manchuria, to Nikolsk, on the South Ussuri Railroad, will have a length of 1,273 miles, of which 945 miles will be in Chinese territory. It deflects the Siberian route nearly 400 miles southward into the fruitful valley of the Sungari river, and shortens it by 341 miles. Work has been begun on a railroad from Shanghai to Woosung. Sheng's extensive scheme of construction, in addition to the difficulty of raising money, met with a serious obstacle in the unwillingness of owners of land to grant the right of way, which they have never been compelled to do under Chinese law by the process of expropriation. When certain landowners refused to allow the Woosung line to cross their property Sheng and the Nankin viceroy issued proclamations quoting the imperial authority for enforcing sales of land at valuations to be determined by local officials. A British syndicate in September, 1897, offered to advance £2,000,000 for the construction of a line from Shanghai to Soochow and Nankin, and at a future date £3,000,000 for its extension through Honan, both advances to be on the same terms as those of the Belgian contract.

The Imperial Government has telegraph lines connecting the capital with all the ports and the frontier provinces, and connecting with the Russian system in Manchuria and with the British Indian system at Manwyne, on the border of Yunnan and Burmah.

The post carts and runners of the imperial postal system hitherto prevailing have been insufficient, so that private messengers have been employed frequently, and the Maritime Customs Department has maintained in the winter months a special service between Peking and the seaports. The Government issued an edict on March 20, 1896, to expand this service into a national post office of the European type, which will be under the direction of the Inspector General of Customs. The Swiss Government received notice that China intends to join the postal union.

Relations with Russia.—A convention concluded with China by Count Cassini, the Russian minister at Peking, in the summer of 1896, in the form in which it was made public, conceded to the Russian Government the privilege of building a branch of the Siberian Railroad from some city in Siberia to Aiyun, in the Amur province, thence southwestward to the provincial capital of Tsitsihar and to Petune, in Kirin, and thence southeastward to the provincial capital of Kirin; also to make a prolongation from the Russian port of Vladivostok to Hunchun, in Kirin province, and thence to the provincial capital of Kirin. The object of connecting the Russian Railroad with the railroad system projected for the three eastern provinces, Fengtien, Kirin, and Heilung-Chiang, is stated to be not only that of facilitating the transport of goods and promoting international commerce between the two empires, but also the strengthening of the frontier defenses and seacoasts. The privileges conceded to Russia are said to be a response for loyal support at the close of the war between China and Japan and aid in securing the retrocession of Liaotung and its dependencies. The railroads are to be built by Russia at her own expense, and are to remain under the control of Russia for thirty years, at the end of which China is disposed, may purchase the railroads, rolling stock, and machine shops. If China fails voluntarily in extending the existing railroad from Shan-Hai-

Kiaochow, Moukden, the provincial capital of Fengtien, and thence to the capital of Kirin province, Russia is authorized to provide funds and undertake the construction, following the Chinese survey from Kirin to Moukden, Newchwang, etc., and China may redeem this railroad at the end of ten years. The railroad to be built by China from Shan-Hai-Kwan to Newchwang, Kaiping, Chinchow, and Lushenkow, or Port Arthur, and thence to Tachenwan, shall follow Russian railroad regulations in order to facilitate commercial intercourse between the two empires. In the settled districts the local civil and military officials will protect the railroads built in Chinese territory by Russia, but in barren and sparsely inhabited districts Russia shall be allowed to place cavalry and infantry guards at the various important stations. The interdiction on the exploitation of mines in Kirin and Heilung-Chiang will be removed. Should China require to reorganize and train on the Western system the territorial army of the three eastern provinces, Russia will furnish qualified military officers on the same conditions as German officers in the Liang-Kiang provinces. Russia has never possessed a seaport in Asia that is free from ice and open all the year round. If, therefore, military operations should suddenly arise in Asia, China is willing, in order to enable the Russian fleets in the eastern seas and the Pacific to move about freely and at pleasure, to lease temporarily to Russia the port of Kiaochow, in the province of Shan-Tung, the period of the lease being limited to fifteen years, at the end of which China shall buy all the barracks, godowns, machine shops, and docks built by Russia. But should there be no danger of military operations Russia shall not immediately enter into possession of the port, in order to obviate the chance of exciting the jealousy or suspicions of other powers. As the Liaotung ports of Lushenkow, or Port Arthur, and Tachenwan are important strategic points, it shall be incumbent on China to fortify them properly, and Russia shall lend all necessary assistance in helping to protect them, and shall not permit any other power to encroach upon them. China, on her part, binds herself never to cede them to another country; but if Russia should find herself involved in a war, China consents to allow Russia temporarily to concentrate her land and naval forces within these ports.

The terms of this treaty were modified in various particulars, but not to the detriment of Russia's position in northern China. The treaty was the outcome of negotiations begun with Li-Hung-Chang in Peking, and continued by him with Prince Lobanoff in St. Petersburg. The Eastern Chinese Railroad Company was organized with its chief office in St. Petersburg, having a Chinese official for president, but Russian directors and a vice-president in real control, who is appointed by the Russian Minister of Finance. None but Russian and Chinese subjects can acquire shares in this company. The company has received the sanction of the Chinese Government to construct telegraph lines from the Liaotung peninsula to Helampo, on the Chinese frontier, and from Aiyun to the eastern Siberian terminus.

New Anglo-Chinese Agreement.—The opening of the West river was only part of the compensation exacted by Great Britain for the violation of the provisions of the convention of March 1, 1894, whereby England renounced in favor of China the suzerain rights over the states of Muang-Lem and Kiang-Hung, to which she had laid claim as successor to the King of Ava, on condition that China should not, without a previous agreement with England, cede any portion of these territories to any other nation. China did, on June 20, 1895,

cede to France a large part of Kiang-Hung to the east of Mekong. In consideration of Great Britain's consenting to waive all objections to this cession China, on Feb. 4, 1897, signed an additional agreement, granting territorial and commercial concessions to Great Britain, and the ratifications were exchanged on June 5. The territory ceded is on the border of Burmah and Yunnan. The boundary line from the Mekong to the point where it first strikes the Salween remains unchanged; but, instead of following the *thalweg* of the Salween for a considerable distance, as before, it takes a sweep to the northeast, leaving to Burmah the Shan state of Kokang and a part of Wanting, a territory 60 miles in extreme length and 25 miles in extreme breadth. Between the Shweli river and the northern termination of the frontier there are three smaller concessions, the smallest of which is a triangular tract between the Nam-Wan and the Nam-Mak, which is recognized in the agreement as Chinese territory, but is ceded to England on a perpetual lease for a rent to be determined at some future time. In addition to the Manwyne and Sansi routes for overland trade, which alone were sanctioned in the convention of 1894, any other routes that may be found desirable in the interest of trade will be opened on the same terms as those. England obtains permission to appoint a consul at either Momein or Shunning-Foo, and one also at Ssumao. British subjects and persons under British protection may establish themselves and trade at these places on the same terms as at treaty ports. The Chinese Government agrees to consider whether the conditions of trade justify the construction of railroads in Yunnan, and in the event of their construction agrees to connect them with the Burmese lines. The significance of this stipulation is that if the French penetrate Yunnan with their railroad, England will insist on its being connected with the system of Burmah.

German Seizure of Kiaochow.—The Chinese Government made plans to establish and fortify a naval station in the Bay of Kiaochow, immediately south of the Shan-Tung promontory, which commands the southern approach to the Gulf of Chili. A strong naval base at this point was reported to be necessary to the safety of China's contemplated naval armaments. This is the point mentioned in the published version of the secret treaty with Russia which is to be occupied by Russian forces for the protection of China's capital in the event of fresh hostilities breaking out in the far East. The Chinese Government granted permission for the temporary use of the bay as a winter station by the Russian fleet in the Pacific. In the beginning of November, Germany landed sailors and marines at Kiaochow, and subsequently stores and material were brought, as if a permanent occupation were intended. The ostensible purpose of the seizure was to insist on redress for the murder of two German missionaries.

Attacks on Missionaries.—Whereas the immediate effect of the war with Japan was to occasion fresh outbreaks of popular rage against missionaries as representatives of the outer barbarians from whom the Japanese had learned the art of war, a desire for a nearer acquaintance with Western institutions and sciences began to be manifested by some of the *literati*, and the attitude of the provincial officials toward the missionaries in many places became more friendly and respectful. The existence of famine, political disturbances, and the agitation of secret societies in various parts of the empire, fresh revivals of anti-foreign feeling traceable to the war or diplomatic disputes, and the renewed circulation of the stereotyped slanders against the missionaries caused outbreaks to occur in various

places during 1897. In January shots were fired at an American mission near Fochow. On April 1 Père Mazel, a French missionary, was murdered at Lodi, on the West river, in a region where robbery and disorder were rife. The priest saw the marauders approaching, barricaded the back door, and prepared to defend the front entrance with a rifle; but a part of the mob tore down the barricades in the rear and killed the missionary with shots from behind. These were not robbers, but fanatics, as they left without plundering the house after murdering the priest and mutilating his body. Anti-Christian riots occurred at Lintsing, in Shan Tung province, where a league of fanatics was formed for the purpose of expelling the Roman Catholics and destroying all their property. In one fight 3 missionaries were killed, 8 wounded, and 4 captured. In Chingtu, the capital of Szechuen, the talk of foreigners kidnapping children was revived and Americans and Europeans were accused of having mapped out the country for conquest. In Kiangsi the English mission at Wochien was destroyed in June, and the Catholic mission was saved only by the intervention of troops. Later the French Catholics in the Yaopeng district of Kwangtung requested their Government to interfere because, as they asserted, the Chinese were persecuting their converts, inflicting tortures, and burning houses and crops.

Famine and Plague.—A drought in the gorge district of the Yangtse-Kiang caused a disastrous famine extending from Ichang up to Chungking and into the hill country in the east. The rivers were so low that rice could not be carried to the sufferers, who perished by thousands in the spring months. In Hupeh the maddened people revolted against the authorities. In northern Szechuen and to the north and east of it towns were half depopulated by starvation and hunger typhus. An army of 30,000 starving people gathered in Szechuen, and in the city of Kichow they enforced demands for food with violence. Pitched battles were fought between the mobs and the Government troops, and 120 soldiers were killed or wounded, necessitating the dispatch of fresh troops from Chungking. Smallpox became very prevalent in central and western China, and near the seacoast the black plague broke out in Swatow and other places.

CHRISTIAN ENDEAVOR, UNITED SOCIETY OF. The following statistics of Societies of Christian Endeavor were published in the "Christian Endeavor Bulletin" of Sept. 11, 1897:

In the United States: Young People's Societies, 27,505; Junior Societies, 11,710; Intermediate, 395; Mothers', 68; Senior, 22.

In Canada: Young People's Societies, 2,925; Junior, 468; Intermediate, 5; Parents', 2; Mothers', 1.

In foreign lands: Young People's Societies, 7,306; Junior, 753; Senior, 6; Mothers', 2; Intermediate, 4. Floating societies, 92.

Whole number of societies, 51,264; of members, 3,075,840.

The International Convention of these societies was held in San Francisco, Cal., July 5 to 12. The annual address of President Clark was on the society as "A World-Encircling Religious Movement. How shall it fulfill God's Design?" The secretary's report showed that 5,000 new societies had been added, in all countries, during the year, and the whole number was now 50,747, with a membership estimated at 3,000,000. Of the societies besides those in the United States, 3,925 were in England, 2,124 in Australia, 433 in Scotland, 311 in Wales, 250 in India, 169 in Ireland, 93 in Madagascar, 68 in France, 100 in Mexico, 66 in Japan, 63 in the West Indies, 41 in Turkey, 53 in China, 52 in Africa, 32

in Germany, with, in all, 7,919 societies outside of America; while Canada had 3,300 societies. The denominations most largely represented in the societies in the United States were, in the order in which they are named, the Presbyterians, Congregationalists, Disciples of Christ, Baptists, Cumberland Presbyterians, Methodists, Protestants, etc.; in Canada, the Methodists, Presbyterians, Baptists, etc.; in the United Kingdom, the Congregationalists, Baptists, Presbyterians, Primitive Methodists, etc.; in Australia, the Wesleyan Methodists. The gifts to missions, through their respective church boards, of 10,468 societies, amounted to nearly \$200,000, and it was estimated that the same societies had given an equal amount for other benevolent causes.

Much attention was given to the subject of missions, and many missionaries were present, with speakers from India, Japan, and Australia. Practical questions of methods and work were considered. A "rally" was held in behalf of Sabbath observance. One meeting was given up to mothers. Twenty-six denominational rallies were held. It was announced that changes were under consideration in committee which would give broader denominational and geographical representation to the body.

CHRISTIAN SCIENTISTS. The doctrine of this sect was first promulgated by Mrs. Mary B. Eddy in 1866. Besides the belief respecting God, the Scriptures, man's sinfulness, the atonement, redemption through the suffering of Christ, the forgiveness of sins, etc., it holds as a distinctive tenet that the way of salvation demonstrated by Jesus is the power of truth over all error, sin, sickness, and death; and it exacts from its adherents a promise to pray for that mind to be in them which was in Christ Jesus. Connected with this doctrine is a healing system based upon the theory that all is mind, without which matter is unreal and nonexistent. The society has enjoyed a very rapid increase within the past few years, which, according to one of its writers, has been most remarkable since the cessation of preaching in 1895. Previous to that time, for twenty-nine years, sermons were delivered before the congregations like those usual in the other denominations; but within the past three years the services have consisted simply in readings, responsive liturgy, and exposition of the Scriptures. Two readers are connected with each society and conduct the service throughout. Besides the Bible, Mrs. Eddy's "Science and Health" and the "Key to the Scriptures" are recognized as authoritative text-books. Every member may be a healer and missionary, but there are also professional healers and missionaries who devote their entire time to the work. In 1894 the Christian Scientists had in the United States 300 societies meeting regularly for worship, 26 teaching institutions, and 66 dispensaries and reading rooms. They had at the end of 1897 229 chartered churches, 114 other regularly established Sunday services, 3,500 ministers, and 40,000 members in the United States, with 64 public reading rooms, situated mainly in the larger cities. These figures show an increase during the year of 44 chartered churches, 500 ministers, and 15,000 members. It is believed that the whole number of adherents in the United States and Canada is not less than 250,000, and that the number of attendants has doubled within the past twelve months. Ten churches were built or acquired in the United States, one in the United States, and one in London, England, during the year; and ground and a Christian Science Hall have been acquired in Concord, N. H. The society has also had marked growth in England, Germany, Italy, France, and Norway.

COLOMBIA, a republic in South America. The Senate is composed of 27 members, 3 from each department, elected for six years by indirect suffrage. The House of Representatives is composed of 68 members, elected by direct vote of the people for four years. Any male citizen twenty-one years old and able to read and write, or having an income of 500 pesos or real property worth 1,500 pesos, is entitled to vote. The acting President after the death of President Núñez on Sept. 18, 1894, was Vice-President M. A. Caro, who resigned in September, 1896, handing over the executive authority to Antonio Roldán for the remainder of the term expiring Aug. 7, 1898. The Cabinet in the beginning of 1897 was composed as follows: Minister of Foreign Affairs, G. Holguín; Minister of Commerce and Communications, D. Ferreira; Minister of War, Gen. Molina; Minister of Public Instruction, J. M. Carrasquilla; Minister of Finance, Ponce León.

Area and Population.—The area of the republic is estimated to be 513,938 square miles. The population was estimated in 1895 at 4,000,000, including 150,000 uncivilized Indians. Education is free in the primary schools, of which there were 1,817, with 89,000 pupils in average attendance, in 1894. The Government maintains 15 normal schools, with 600 students, and a university, with 1,600, while 1,000 more attended the universities of the departments.

Finances.—The customs yield nearly two thirds of the revenue, which was estimated in the budget for the period 1895-'96 at 26,226,300 pesos, while the expenditure was expected to amount to 26,305,191 pesos. The estimates for the biennial period ending June 30, 1898, make the revenue 28,224,000 pesos.

The consolidated internal debt on June 30, 1896, amounted to 5,633,046 pesos, and there was a floating debt of 1,892,110 pesos. The paper money in circulation amounted to 30,862,352 pesos, making the total currency obligations of the Government 38,387,508 pesos. The foreign debt consists of a loan of £1,913,500 raised in England in 1873 and arrears of interest on this, bringing the total up to £3,514,442 on Dec. 31, 1896. An arrangement for the settlement of the debt was made with the British creditors, subject to the approval of the Colombian Congress.

After the conversion of 1873 the coupons were paid till 1879, and since then the bonds have been in default. Compromises made with the foreign bondholders in 1881 and 1884 were not ratified by the Congress. Another one negotiated in 1890 was rejected by the bondholders, and the Government would not even consider any arrangement until in 1896 a provisional agreement was made, according to which the Colombian Government undertook to pay the full principal and 43 per cent. of the defaulted interest, giving new bonds bearing 1½ per cent. interest for the first three years, 2 per cent. for the next, and after six years 2½ per cent., with a sinking fund that would extinguish the debt in thirty-six years.

The Cerruti claim for the value of estates and stores destroyed by Government troops in 1885 on suspicion that the owner, an Italian subject, was abetting the revolution then in progress, was referred to President Cleveland, who awarded the claimant £60,000 sterling and a guarantee against debts accruing from the loss of his business. This guarantee the Colombian Government refused to give, asserting that the matter was not submitted for arbitration.

Army.—The army on the peace footing is fixed at 5,300 officers and men. In case of war every Colombian fit to bear arms can be called into the service.

Commerce and Production.—There are 4,961 mines in Colombia, of which 3,398 are alluvial or quartz gold mines in Antioquia. In Cauca and Tolima, where 1,365 of the mines are situated, silver is found associated with gold and other metals. The average annual product of the precious metals is \$4,000,000. There are 30 emerald mines, 14 for cinnabar, 7 manganese mines, and others for the production of copper, platinum, lead, quicksilver, iron, coal, and salt. The Muzo mine produces about \$100,000 worth of emeralds annually. The salt mines at Zipaquirá, belonging to the Government, almost supply the needs of the country. Petroleum and coal are found in several departments. The iron mined at Pradera, near Bogotá, is manufactured into wrought iron, rails, and machinery castings. Agriculture is not carried on extensively, though the soil in many parts is very fertile. The improvement of facilities for transportation would greatly enlarge the opportunities for commerce in agricultural produce. Coffee of fine quality is produced, and its cultivation is extending rapidly. Other products are tobacco, cacao, sugar, vegetable ivory, rubber, and dyewoods. There are 3,465,000 cattle, horses, mules, and asses, and 3,487,000 sheep, goats, and hogs in the country according to official estimates. The total value of the imports in 1895 was 11,528,365 pesos, and of the exports 15,088,406. The principal articles of import are food, drinks, textiles, and iron and steel goods. The exports are gold bars and dust, coffee, peanuts, silver ore, cacao, cotton, dyestuffs, live animals, tobacco, rubber, hides, and timber.

Navigation.—The number of vessels entered at the port of Barranquilla in 1895 was 261, of 392,573 tons, and cleared 258, of 391,668 tons. The merchant marine consisted of 5 sailing vessels, of 1,157 tons, and 1 steamer, of 138 tons. Of 33 steamers that call at the ports of Colombia every month, 15 are British, 9 American, 4 German, 3 French, 1 Spanish, and 1 Italian.

Communications.—There were 346 miles of railroad in operation in 1896. The telegraphs have a length of 6,835 miles. The internal postal traffic in 1893 was 302,410 letters and postal cards, 615,844 samples and papers, and 70,038 registered letters and packets, while 342,440 letters and 206,171 papers and packets were mailed for foreign countries.

The Panama Canal.—The new canal company, formed in Paris in 1894 to complete the ten-lock canal rising to a maximum altitude of 133 feet, in the place of the sea-level canal originally planned by Ferdinand de Lesseps, made fair progress with the limited capital at its disposal, only 62,500,000 francs, of which not more than half was available for work on the canal. The cuttings in the Culebra and Emperador sections have assumed definite proportions. At the beginning of 1897 there were 3,600 laborers at work, recruited in Jamaica and Trinidad, in Sierra Leone, and in the provinces of Colombia. The present work is mainly experimental, intended to prove that a lock canal is feasible. About 1,500,000,000 francs have been expended since the scheme was first launched in 1881. The net receipts of the Panama Railroad, which is owned almost entirely by the canal company, increased from \$266,000 in 1895 to \$396,000 in 1896. The profits of four years have been applied to the purchase of three ocean steamers. The traffic from the Pacific to the Atlantic has decreased, owing to small crops and the competition of tramp steamers, but in the opposite direction, through arrangements with the steamship companies, there has been a large increase of traffic. The Government receives \$250,000 a year from the railroad.

The commission of engineers reported in 1890 that to complete the canal, with a width of 98½ feet at

the surface and half that depth, would cost \$200,000,000 francs, including interest on the investment and an allowance of 20 per cent. for unforeseen expenses. The work already done by the old company and the plant on the grounds could not be duplicated for less than 450,000,000 francs. If no work was resumed in 1894 the engineers surveying the route concluded that the new plan for controlling the Chagres river and the task of preventing landslides in the Culebra cut would be less than they had expected, reducing the first provisional estimates by 150,000,000 francs. The amended plan is to have ten locks, and to supply water to the higher locks from immense reservoirs, which will relieve the floods in the Chagres river. The work done since the resumption of operations has cost comparatively much less than that accomplished under the old extravagant management. The rate of progress has been greatly accelerated. There were five or six times as many men employed in 1897 as in 1895. The excavations extend 16 miles from Colon and 4 miles inland from Panama, and at the present rate, if the engineering difficulties have not been underrated and if the financial means can be obtained, the canal will be completed within the ten years stipulated on the renewal of the concession.

COLORADO, a Western State, admitted to the Union Aug. 1, 1876; area, 103,925 square miles. The population in 1880, according to the census, was 194,327; in 1890 it was 412,198. Capital, Denver.

Government.—The following were the State officers during the year: Governor, Alva Adams, Democrat; Lieutenant Governor, Jared L. Brush, Republican; Secretary of State, Charles H. S.

Dudley, Edwin J. Temple, Oscar J. Pfeiffer and William J. Orange, State Judges, J. S. H. Ford, Commissioner of Mines, H. A. Deane, Registrar, Land Board, L. C. Patton, State Engineer, H. B. Cramer, Fish Commissioner, J. S. H. Ford, Coal Mine Inspector, David H. H. Ford, Attorney, Thomas A. Richard, Chief Justice of the Supreme Court, Charles D. Hays, Recorder, Supreme Justice, Luther M. Gossard, Recorder and J. J. Campbell, Republican, Court of Appeals, President Judge, Charles I. Thompson, Associate Judge, Julius B. Hessel and Adam W. H.

Finances. The report of the Auditor shows the total estimated floating debt of the State, Nov. 30, 1899, to have been \$2,817,600.04. The bonded indebtedness was: Capital building, \$800,000; school deficiency, \$100,000; Apple Creek improvement, \$70,500, making the bonded indebtedness \$970,500; and the total bonded and floating debt \$3,788,100.04. The assets due the State amounted to \$845,190.00, leaving the total net indebtedness \$2,942,910.04.

⁴ The estimated marginal effects for 1997-98 are equal to $\beta_1(1,000,872,740)$. That is, the estimated marginal propensity to consume for 1997-98 is 1.000872.

The appropriations from the Federal Reserve fund for 1895-96 amounted to \$1,187,000, of which \$21,021.90 remained unexpended. The appropriations from special funds aggregated \$134,954.98, of which \$27,450.00 remained unexpended.

The total valuation of the counties amounted to \$206,598,561 in 1896. The railroads, the average of which was 4.487 and the valuation \$11,716,267, are included in this summary.

The fees received at the office of the Secretary of State amounted to \$246,844.92, of which \$229,960.50 was for 3,408 findings of articles of incorporation.

Charities and Corrections.—The report of the penitentiary at Union City shows that there were in prison Nov. 30, 1896, convicts to the number of 607, an excess of 7 over the number two years previously; but the daily average count was increased by 35. The total cost of maintenance for the term was \$169,579.14, making about 36½ cents a day for each convict. This is the lowest per capita since 1876, the highest having been 76½ cents in 1881-82. During the past two years \$8,393 has been expended for improvements and repairs.

At the State Reformatory at Maricao Vista the total number of prisoners, Nov. 30, 1896, was 102; an increase of 48 over those at the close of the previous year. Of the 128 prisoners who have been paroled during the past two years, 81 report regularly, are working, and have good places; 29 reported for a time and then stopped; 13 never reported; and 5 have been returned for violating their paroles. The cost of maintenance for the two years was nearly \$55,000.

The average daily attendance at the Industrial School for Girls was 54, and the average monthly expenses \$590.72.

At the State Home for Dependent Children, nearly 60 were cared for from its opening, March 21, to Nov. 30, 1896, and 19 have been adopted into families.

The average number of inmates at the Soldiers' Home at Monte Vista in 1926 was 161. The estimated cost of maintenance for 1927 is \$60,000. Improvements costing about \$14,000 have been made within the past two years.

The 33 counties that reported to the State Charities and Corrections cared for an average of 349 poor persons at their poor farms, at an expense of \$49,364.41. Other relief cost these counties \$82,674.

The prison census from 1965 to 1970 shows the

ALVA ALAM, GOVERNOR OF CALIFORNIA

Whipple, Democrat; Treasurer, George W. Kephart, Republican; Auditor, John W. Lowell, Republican; Attorney-General, Byron L. Carr, Republican; Superintendent of Public Instruction, Grace E. Patton, Democrat; Adjutant General, C. M. Moses, Republican; Regents of the University, David M. Richards, W. E. Anderson, Charles R.

total number of prisoners in county jails in 1895 to have been 3,530, of whom 225 were females. The maintenance of county jails has cost \$86,873.21; maintenance of the prisoners has cost \$41,763.49; salaries of jailers and guards has cost \$37,628.92; average cost *per capita*, \$258.55. One hundred and fifty-two of the prisoners were under sixteen years of age.

The Board of Pardons considered 332 applications during the last biennial period, and recommended 54 for pardon, 6 for conditional pardon, 15 for commutation, and 4 for respite.

Mining.—The report of the director of the mint for 1896 gives the product of gold of Colorado as 721,320 fine ounces, valued at \$14,911,000. The value of the silver product was \$29,185,293. This is about one third of the output of the precious metals in the country.

The receipts of gold bullion at the Denver branch mint show a large increase of production during the first nine months of 1897 over the corresponding months of 1896. The aggregate in 1896 was \$3,128,436.16; in 1897 it was \$8,388,088.56. The figures represent what is estimated as a little over half the State's production of the yellow metal, because only 2 out of the 7 smelters send their bars to this institution.

"The increase in the gold output," says a Colorado journal, "is general, and comes from all the mining camps of the State, Cripple Creek being in the lead."

An estimate of the output of 1897, made in July and based on the figures for the first six months of the year, was as follows: Cripple Creek (El Paso), \$14,000,000; Gilpin County, \$3,000,000; San Miguel County, \$3,000,000; Clear Creek County, \$1,500,000; Lake County (Leadville), \$1,000,000; San Juan County (Silverton), \$500,000; Boulder County, \$500,000; Ouray County, \$400,000; Summit County, \$250,000; Park County, \$250,000.

The recent introduction of processes for treating low-grade ore promises greatly to increase the output of the State.

Leadville is to have a reservoir on the Lake Fork branch of Arkansas river, where 2,000 acres have been bought for the purpose. The plan is to maintain the reservoir for storage, conduct the water through pipes to the foot of the little gulch leading up to Leadville, and there build a power house. This will furnish electric power to the mines of the whole district.

The product of lead for 1896 was valued at \$3,967,314, and that of copper at \$802,697.

Gold-Mining Convention.—The first International Gold-Mining Convention met in Denver, July 7, 8, and 9. Its objects were "to secure such national legislation as may be calculated to promote the business interests and development of the resources of the mining industry in North and South America; to bring together mining men and investors; to increase reciprocal trade among them; to discuss such questions as are naturally suggested by its objects; to cultivate acquaintance, fraternal feeling, and hearty co-operation among the various mining, commercial, and labor bodies represented, and especially to take under advisement the importance of the creation by Congress of a department to be known as the Department of Mines and Mining, thus securing a Cabinet officer to represent an interest which affects more than one third of the people of the United States."

L. Bradford Prince was president of the convention. The name of the organization was changed to The International Mining Congress, and Salt Lake City was chosen as the next place of meeting. Papers were read on the treatment of ores, the history of various mining camps, and geological

formations of mining districts. A resolution was adopted urging Congress to open to mining locations the Spanish land grants in California, Arizona, New Mexico, and Colorado; but a similar one regarding the gilsonite lands of Utah was laid on the table.

A committee was appointed to take steps for the establishment of a National Department of Mines and Mining, with a Cabinet officer at its head, and one to draft amendments to the mining laws which Congress will be asked to pass.

Decision.—A decision given by the Supreme Court in May in a case from Colorado, involving a controversy over the rights of tunnel-site owners and subsequent locators of veins along the line of the tunnel site or on its territories, settles the contention that a tunnel-site locator has the right to the possession of every blind vein that crosses the line of the tunnel within 3,000 feet from its face, which was not discovered when the tunnel was located; provided, that the tunnel-site owners have prosecuted the work on the tunnel with diligence. And the discovery of a lode or vein from the surface after the location of the tunnel will not deprive the owner of the tunnel of any part of the vein; provided, further, that he has diligently prosecuted his work on the tunnel. The decision also settles the right of the owner of such tunnel to locate 1,500 feet along the vein, and this location may be made partially upon one side of the point of discovery of the tunnel, or entirely upon one side.

Business.—The Denver Clearing-House Association issued an official statement in October showing the increase in business for six weeks of 1897, compared with the corresponding period of the preceding year, indicating the growing activity in business. The total increase for six weeks in September and October was \$1,934,538.

A Denver newspaper said in April: "The deposits of money in one bank in this city have increased by \$3,000,000 within less than a year. In other banks there has been a parallel increase."

The Leadville Strike.—The miners' strike, which began June 19, 1896, continued until March 9, 1897, ending in a victory for the mine owners. Gov. Adams went to Leadville in January and brought about a meeting between managers of mines and leaders of the strike in the hope of effecting a settlement. Both the miners and the owners made propositions, which were rejected. About the middle of January the great pumps that drained the mines on Carbonate Hill, the center of Leadville's wealth, were taken out, allowing the many mines there to fill with water. The Legislature appointed a committee of 2 Senators and 3 Representatives to investigate the strike, which committee in their report proposed a plan of settlement. At a meeting of the Miners' Union, March 9, it was decided by a vote of about 1,100 to 300 to declare the strike off. This action was understood to be owing to the reduction of the weekly relief allowance to an amount barely sufficient for meager existence, and the apparent hopelessness of any change in the attitude of the managers. The expense to the State for protecting property and keeping order by the militia was about \$300,000, and the cost to mine owners and miners of the camp was estimated at \$4,000,000, to say nothing of the cost to labor organizations elsewhere that were taxed for aid to the strikers.

Public Lands.—The amount of vacant public lands in the State is given as, approximately, 4,037,204 acres.

Efforts have been made this year to get the case of the Las Animas grant before the Court of Claims. It is one of those old undivided tracts the title to which, while allegedly perfect, never has been passed

upon by the court, and is in the anomalous position of being neither actually in the public nor in the private domain. It covers 3 counties of southeastern Colorado, takes in the city of Trinidad, the towns of La Junta and Las Animas, is traversed by 2 lines of railway, and is supposed to contain, besides great cattle ranges, valuable deposits of coal and iron. Legislative action is necessary to send the case to the Court of Claims, since by law no claim for more than 11 leagues of land can be brought before that court, and this involves 100 leagues. A bill granting permission to the court to take up the case was sent two years ago to the Committee on Public Lands.

It is complained that hunters are fast exterminating the game in the State and that the laws are not enforced. The Indians, who have had much of the blame for illegal slaughter, are now said to form but a small proportion of the lawbreakers. Meat hunters, hide hunters, and trophy hunters are among them, and in most instances the bodies of the animals are left to rot upon the ground by the hide hunters and sportsmen, who carry off the skins, heads, and feet. The Legislature revised the game laws, and if they are enforced the animals will be protected.

Legislative Session.—The eleventh General Assembly convened Jan. 6 and adjourned April 5. The parties stood on joint ballot: Populist, 34; Democrat, 25; Republican, 16; Silver Republicans, 10; National Silver, 12; Socialist, 1; Single Tax, 1; Nonpartisan, 1.

Francis Carney was president *pro tem.* of the Senate and Edwin W. Hurlbut Speaker of the House. The office of chaplain of the Senate was offered to the Rev. T. H. Malone, editor of the "Colorado Catholic," but he declined in favor of the Rev. Myron W. Reed, who had been associated with him in a movement to secure works of improvement for the laborers of Denver. Rev. W. S. Rudolph was chaplain of the House.

The message of the retiring Governor was read Jan. 9. It explained that the necessity of keeping troops in Leadville ever since Sept. 22 was due to the failure of the sheriff to enforce the laws. The Governor recommended the establishment of a board of conciliation and mediation, and advised the Legislature to memorialize Congress to establish a Government Department of Mines.

Gov. Adams was inaugurated Jan. 12 with conspicuous simplicity, at an expense to the State, according to the newspaper reports, of less than \$5. He walked to the Capitol to take the oath of office, and there was no parade, ball, reception, or demonstration of any kind.

The election for United States Senator to succeed Henry M. Teller took place Jan. 19. Mr. Teller was the candidate of the united silver forces, and George W. Allen was nominated by the regular Republicans. The vote stood 92 for Teller to 6 for Allen.

Among bills that became laws was one abolishing capital punishment and substituting imprisonment for life; one providing for the reorganization of the militia; a new assignment act; a new law relating to negotiable instruments; one requiring all persons trading or doing business under the name of "manager," "trustee," "agent," or in any other representative capacity, and persons using the words "& Co.," or "& Company," or merely one initial letter as part of the business name, and persons doing business under any other name than the personal names of its constituent members, to file with the clerk and recorder affidavits showing who are so represented, and providing a penalty for failure so to do; a new law for regulating the business of pawnbrokers; one declaring bicycles to be baggage

to be transported by railroad on the same terms as other baggage; and one to prevent and punish fraudulent buying agents. The chamber of Denver was attended in regard to colored territory and to special assessments.

Appropriations for State institutions in 1897, 1898 were made as follows:

For the Industrial School for Boys at Golden, \$50,000, besides the cash receipts of the institution.

For the Insane Asylum, Fort Lupton, \$100,000 for payment of a deficit, \$52,818.52, for maintenance, \$2,500.

For the Penitentiary, \$150,000.

For the Reformatory at Buena Vista, Support, \$50,000; deficiency, \$8,645.10; sewerage and farm implements, \$1,500.

For the School for the Deaf and Dumb and the Blind, for insurance, apparatus, etc., \$5,000.

For the Soldiers and Sailors' Home, \$40,000.

For the State Home for Dependent Children, \$20,000.

For the State University, \$40,000.

Other appropriations were for the two years: For maintenance of the Capitol building and grounds, \$65,000; for the completion of the Capitol building and improvement of the grounds, \$140,000, of which \$80,500 is to be used for finishing the interior of the building; for a part of the expenses of the Legislature, \$7,000; for operating the fish hatcheries, \$7,000; for the Board of Health, \$2,500; for deficiencies in the printing fund, 1896-96, \$1,756.77.

Other bills that became laws were:

Creating a State and local boards of arbitration and providing for the adjustment of differences arising between employers and employees and defining the powers and duties thereof and making an appropriation therefor.

Providing that every able-bodied convict be put to the work that is most suitable to him and that will least conflict with free labor, and that the earnings of such convict, after the deduction of sufficient to pay the cost of maintenance and retention, shall be given to the family of such convict, or dependents, if there be any; if there be none, the same accumulated shall be paid to such convict upon discharge, and appropriating \$10,000 to carry out the provisions of the act.

Directing that the Twin Lakes Hatchery be abandoned or sold.

Creating a department of forestry, game, and fish, with a commissioner at a salary of \$1,200 and an allowance of \$500 for expenses.

Providing that no person may acquire property in game; all is to remain the sole property of the State, except, of course, whatever may be killed or caught according to the game laws.

Making it unlawful to kill or take at any time any bison, mountain sheep, elk, or beaver, except that such may be caught for park purposes.

Creating a nonpartisan State Board of Horticulture, consisting of six practical horticulturists, with a secretary at a salary of \$1,000 and mileage; the members to receive \$3 a day for time actually given to the work, and traveling expenses, the limit of time paid for to be thirty days a year.

Providing for the establishment of an Industrial School for Girls at or near Denver.

To prevent blacklisting and boycotting.

Regulating building and loan associations.

Repealing the "Act to provide for the erection and completion of a Capitol building," 1891, and creating a board of management and supervision; and creating a board of capital construction for the purpose of supervising and controlling the construction, completion, and furnishing of the Capitol building.

Authorizing the Treasurer to pay the interest for two years on the "casual deficiency" bonds and the "insurrection" bonds.

Prohibiting druggists from selling cocaine without a physician's certificate.

Creating a board of examiners in dentistry.

To protect employees and guarantee their right to belong to lawful labor organizations, unions, societies, or political parties; and to provide a penalty for coercing or attempting to coerce them.

To provide for the funding of \$225,000 of the indebtedness of the State, to meet expenses incurred in suppressing insurrection during 1896 and 1897, and appropriating money out of the general revenue fund to pay the first year's interest on same by the issuance of registered coupon funding bonds.

Repealing the acts creating a Bureau of Immigration and Statistics, and to promote the organization of fair associations.

Allowing surety companies to give and guarantee official bonds under certain regulations.

Memorials to Congress were adopted asking that "generous provision be made for that branch of the United States Geological Survey which is engaged directly in examining the metalliferous districts of the States and Territories, to the end that needed surveys may be commenced or completed, and the results published at the end of each season in pamphlet form, as much of the value of the information thus received depends upon its speedy publication"; and that the bill for the erection of a Government building at Glenwood Springs be passed.

As the regular session adjourned without enacting a general bill providing an appropriation for the ordinary expenses of the executive, legislative, and judicial departments of the State for the years 1897 and 1898, the Governor called a special session to meet April 6 for the sole purpose of passing such a bill, and it was accordingly passed.

The Governor vetoed a bill regulating the manufacture and sale of oleomargarine on the ground that it was not as good a law for the dairy and farm interest as the present statutes regulating the dairy industry and the oleomargarine traffic.

Political.—The only State election this year was for choosing a justice of the Supreme Court. William Gabbert was the nominee of the People's party on a platform demanding the independent and free coinage of silver and a sufficient volume of paper money to be issued by the Government, and denouncing government by injunction. The returns showed a majority for him of about 3,000.

COMPRESSED AIR, USES OF. The value of compressed air as a convenient means of distributing power was known long ago, but its general introduction is of comparatively recent date, as only within late years has it been practicable to manufacture at low cost air-tight appliances for utilizing it to advantage in a variety of ways. Among the earlier and more familiar uses to which it has been applied are the railway air brake, pneumatic cushions, and pneumatic dispatch tubes. The compressed-air rock drill came into use about 1865, and its employment in forming tunnels, mines, and other excavations has become almost universal. It is used even by the naked African laborers in the Johannesburg gold mines. Compressed air has a conspicuous place in most modern engineering works. The drills and channeling machines and most of the small engines on the Chicago Drainage Canal were air-driven. The rock work at the bottom of Harlem river for the foundations of the bridge at 181st Street was all done in caissons of compressed air. The Blackwall Tunnel, under the Thames, England, was also constructed under air pressure. Compressed air has replaced steam in many mechanical uses, and done away in many cases with such me-

chanical appliances as shafting, belts and pulleys, and gears. It is the active competitor of electricity in a hundred fields of usefulness, and is frequently preferred to the latter as a mechanical agent for transmitting power.

Largely owing to the inroads of electricity in every branch of mechanism, it has come to be recognized that the frictional losses sustained in transmitting power by shafting can be saved by employing other means of connecting an engine with the machines that it is designed to drive; and the electric wire being found to afford a means of transmitting power with small loss, builders of machinery came to understand more fully the fact that pipes or hose filled with compressed air afford an equally economical means of sending power to a moderate distance with little loss. Thus the development of electrical methods of power distribution have opened the way for compressed air and brought about a development of air-operated machinery which is most extensive and is constantly increasing.

The machine that confines the air so as to give it an effective pressure is called an air compressor, and is a form of pump, or rather a steam engine and pump combined. In the usual construction a steam cylinder and an air cylinder are placed end to end, and the steam-cylinder piston is made to drive a piston within the air cylinder so that at each stroke a cylinderful of air is compressed and forced out, as into a tank. The air so stored becomes a reserve of power that may be used at any convenient time at a distant point by transmission through pipes, the power being utilized at the receiving point by means of a cylinder and reciprocating piston, on the principle of the steam engine, or in any other convenient manner. In compressing air a great amount of heat is generated, and the loss of this would mean a corresponding loss in power; hence means have to be provided for saving the heat. The common method is to surround the air cylinder, where the compression is going on, with a water jacket, thus cooling the air and heating the water. As the water is heated it is led away to feed the boiler of the steam engine. Of course the hot water brought to the boiler is turned into steam very quickly, and this saves coal and economizes the loss that otherwise would be sustained. In practice it is found best to compress the air in several stages. All sizes of compressors are built, from those delivering power for operating one rock drill to great mechanisms capable of driving a hundred large machines.

Drills.—The rock drill is simply a percussion drill or chisel driven up and down and forming a hole by repeated blows on the rock. It is also operated by steam, and occasionally by electricity, but for underground work in mines and tunnels compressed air is preferred, as the power delivered to the drills is worth all it costs in the way of furnishing fresh air to the men operating the machines. The compressed-air rock drill has been used on every great tunnel built within the past twenty years, and for such excavations as those at Hell Gate, the Croton Aqueduct, and the tail race for the escape of the water at the Niagara power plant. Drilling in caissons or in front of air locks is the common method in excavating under water. In caisson work, as on river bottoms, the men descend through air locks to the caisson or chamber which has been sunk to the bottom, and there work under a pressure of air sufficiently great to prevent the inflow of the water from the open bottom of the caisson. In excavating the Blackwall Tunnel the work was carried only 8 feet below the Thames bottom, this thin stratum being composed of gravel and mud. The workmen were enabled to prosecute their labors there without being flooded or drowned

only by the maintenance of a heavy pressure of air in their rear, which held back the ooze and gave a temporary support to the undermined gravel. Large metal cylinders were advanced as the tunnel was formed, and in the front of these were maintained air locks with doors through which the men and tools were passed in and the excavated material was passed out. As the air leaked out of the forward part of the work, bubbling up into the Thames, it was necessary to furnish a very large supply, and about 8,000 cubic feet a minute were pumped in during the most critical portion of the work. A pressure of 20 to 48 pounds to the square inch was delivered, the latter being equal to more than 3 atmospheres. This was found to have a somewhat intoxicating effect upon the workmen, and some of them suffered with slight affections, as temporary paralysis, from working under such conditions, but no serious results followed. The men were allowed to remain under the pressure only about two hours at a time. It was essential that they should use care in going into and out of the air locks, to allow the air to pass freely to the inside of their eardrums, else the sudden change of pressure on the outside would produce a sharp pain in the drum. A similar method of excavating was used under the East river, at New York, and under the St. Clair river, and in excavations under Lake Michigan.

Cars.—The driving of street cars by compressed air has made considerable progress. It was first made a success in France, being used on a line between Paris and Nogent-sur-Marne and on the Nantes Railway, and more recently on a line between the Louvre and St. Cloud. A line is also operated at Bern, Switzerland. The air is stored in tanks under the cars, the pressure in the tanks on the Paris line being 2,000 pounds to the square inch at starting. A run of 6 or 8 miles can be made without recharging, but it has been found best to recharge, while stopping at stations, about every mile and a half. The air is used to drive the cars by means of expansion in cylinders like those of a steam engine, being admitted to the cylinders at a reduced pressure of about 150 pounds. The storage tanks employed are known as Mannesman tubes, being flasks or cylinders of mild steel of great tensile strength. They can not explode, in the sense of a general breaking up, but if a burst occurred it would be in the nature of a rip, permitting the escape of the air in a sudden blast, dangerous only to those immediately in front of it.

The Hardie system of compressed-air propulsion for street cars has been tried on the 125th Street line in New York city, and its operation has been highly praised by the technical press. The cost of its operation has not been made public, but it is believed to be greater than that of the electric trolley system. The air is stored in tubes under the car, as in the Paris system, and used in cylinders of the type employed on steam locomotives. The pressure in the tubes is 2,000 pounds to the square inch, and this is brought down by reducing valves to 130 pounds. At this pressure the air is reheated by being passed through a chest of hot water, greatly increasing the pressure, mostly by expansion of the air due to heat, but partly by vaporization of a portion of the water. The car has the advantage of operating without dead centers and running equally well in either direction with very little noise and no smoke or dirt. The system avoids all the difficulties of exposed wires incidental to electrical propulsion and the expense of underground mechanism as with cable railways. Locomotives for underground haulage in mines are built on similar lines.

Pneumatic Tubes.—Transportation tubes for carrying small packages by pneumatic pressure have been established in London, Paris, Vienna, and

Berlin for some years. They have also been employed by the Western Union Telegraph Company in New York, and in Chicago for press dispatches to the newspapers from a central station. All these tubes have a diameter of less than 3 inches. In 1893 a pneumatic-dispatch service was established in Philadelphia with tubes of 6½ inches diameter to connect the main post office with a substation half a mile distant. The operation of this was so satisfactory that a system of large tubes was undertaken in New York city to connect the post office and the Produce Exchange, the 49th Street and Lexington Avenue branch post office, and the main post office in Brooklyn. The system between the first-named points was completed and officially opened Oct. 7, 1897, the first package sent consisting of a copy of the Constitution of the United States, President McKinley's inaugural, and a Bible. The lines are double, so that the service may be continuous in both directions. The carriers are metal cylinders about 20 inches long, and are slightly larger in circumference at the ends than elsewhere so as to allow of rounding curves. They operate very well with a comparatively loose fit, and may be sent under a headway of only a few seconds without interfering with each other.

Guns.—The compressed-air torpedo gun, commonly called the dynamite gun, introduced by Capt. Edmund L. G. Zalinski (see "Annual Cyclopaedia" for 1888, page 796), has attracted wide attention in military circles within a few years. The air gun, an old invention, was revived by Mr. Mefford, of Detroit, about 1885, who suggested the practicability of its use for throwing high explosives. Up to the present time 11 pneumatic dynamite guns have been supplied to different countries, 1 going to England, 1 to Brazil, 3 being placed on the United States man-of-war "Vesuvius," 3 at Sandy Hook, N. J., and 3 at Fort Winfield Scott, San Francisco, Cal. Of these, the 3 on the "Vesuvius," of 15-inch caliber, were designed by Mr. Sewall and Mr. G. Reynolds, with the assistance of other engineers, and one of the Sandy Hook battery, of 8-inch caliber, was designed by Messrs. N. Pratt and Sewall. The last 7 guns, all of 15-inch caliber, were invented and designed by Capt. John T. Rapiéff, who has obtained several patents for the guns. Capt. Zalinski, then a lieutenant, became acquainted with the system, and, upon presentation of the subject to the United States Government, was detached to investigate the matter, and through his efforts, experiments, etc., air guns attracted a proper public interest, which eventually culminated in an order from the United States Government. The maximum range of the dynamite gun is about 6,000 yards; the actuating air pressure is 1,000 pounds or less to the square inch; the storage pressure is 2,000 pounds or less to the square inch. The guns are capable of throwing projectiles containing 50, 100, 200, or 500 pounds of high explosives, using for smaller charges sub-caliber projectiles. The pressure of air does not increase as the projectile moves along the bore of the gun. The test of the English gun, the first of the new type, at Shoeburyness, affords a good idea for the accuracy of fire, being made on land, so that there was no doubt as to the first point of graze or the strike of the projectile. It was found that at a distance of 3,642 yards five successive shots fell in a rectangle 7 yards long by 5-4 yards wide, a result considered phenomenal. At the experiments in the United States the horizontal target given by the Government was 120 by 30 yards (this being almost the size of the United States steamer "Chicago"), into which it was required to place a certain percentage of the number of projectiles thrown. All the projectiles were dropped into a

horizontal rectangle having less than one twentieth of the superficial area of the target.

The disappearing-gun carriages used at Sandy Hook and elsewhere are operated successfully by compressed air. An air cylinder stored at a pressure of about 575 pounds is employed to serve as a spring, and receive the kick or rearward thrust of the gun as it is fired and descends below its parapet. The pressure in the cylinder is utilized later to restore the gun to firing position.

Torpedoes.—Many of the automobile torpedoes, as the Hall and the Whitehead, make use of compressed air. The latter carries the air in a reservoir, stored at a pressure of 1,000 pounds. The air, being admitted to a triple-cylinder motor, drives two oppositely revolving propellers set in the tail of the torpedo. The torpedo is discharged from a gun by means of compressed air, this being the method commonly employed with locomotive torpedoes for naval warfare. The torpedo of Ericsson's "Destroyer" is fired by a combination of powder and compressed air, the advantage in this being that the air cushions the initial shock of the powder on the torpedo, and also aids the efficient combustion of the powder.

Ice Making.—Refrigeration and ice making are now accomplished almost altogether with the aid of air-compressing plants, ammonia gas being usually substituted for air in the compressor and liquefied by pressure. When the liquefied ammonia is allowed to expand it gathers heat to compensate for what it has lost, and in so doing reduces the temperature of its surroundings. Under some conditions atmospheric air is compressed and expanded, instead of ammonia.

Machinery.—A few years ago a large machine shop in St. Louis was equipped wholly with compressed-air mechanism. A 55-horse-power compressor operates the plant, the air being stored in a reservoir and piped to points where wanted. As a rule, the piping is brought directly over each tool. For the larger tools motive engines are employed, and when it is desired to drive them the turning of a cock admits the air, and the engine is stopped in the same simple manner. This avoids the running of idle shafting, there being no consumption of power when the machines are still. The system has been copied in many establishments, notably railroad shops, where air is peculiarly serviceable, because it lends itself to a number of peculiar uses to which no other motive fluid is applicable. In these shops traveling cranes, each bearing its own air cylinder, are used for handling very heavy castings. Smaller weights are conveniently handled by compressed-air hoists, which may be used almost anywhere. Hoists operating from overhead are made in the form of a long cylinder with a hook at each end. This is hooked to an overhead beam and to the article to be hoisted, and compressed air is then admitted to the lower end of the cylinder and slowly raises a piston to which the lower hook is attached, and the lift is made in a most simple manner. Only moderate pressure is required, and any good quality of hose will bear the strain. Lifting jacks, punching machines, riveters, and most of the class of machinery usually operated hydraulically may be managed equally well with compressed air, and with greater convenience where a compressor plant is used. Such a plant also does away with the necessity for blowers or rotary fans, being very convenient for operating a blowpipe, to direct a gas flame, or for fanning a forge. Steam pipes, steam passages and steam ports may be readily cleaned by a blast of compressed air, and in many railroad shops the cars and cushions are cleaned in the same manner, the air being applied through a hose, much as a fireman throws water on a burning building.

Very many of the safety appliances used in connection with railways depend upon compressed air. It is peculiarly adaptable to the operation of interlocking switches and semaphores, being commonly used in conjunction with electric and positive mechanisms.

Pumps.—The air-lift pump is a recent invention, suited to assist the flow of artesian wells. The well has a main pipe, which the water may ascend, and beside this is a smaller pipe, down which the compressed air passes. The smaller pipe enters the bottom of the main pipe below the water level, and carries water with it in its ascent to the surface. The expansion of the air cools the water and aerates it, so that it is in the best possible condition for drinking. The water supplies at Wayne, Pa., and Rockford, Ill., are obtained in this manner, and at the latter place the natural flow of a well has been increased fivefold. A similar mechanism has been employed to drain swamps or pits, and has proved effective and economical.

Various Uses.—Coal-cutting machines are frequently driven by compressed air, at a pressure of about 75 pounds, the exhaust air being valuable for ventilation. Some of these machines are mechanical picks, but the undercutting machine is more usually employed. A great variety of miscellaneous small tools are conveniently operable by compressed air, as the calking machines used in solidifying the joints of steel tanks, boilers, ship plates, etc. Air-operated stone-dressing machines have largely replaced hand labor within a few years, doing better work at a fraction of the cost. The machine delivers rapid, reciprocating blows with dressing tools, and will level off a square foot of granite in two and a half minutes. By regulating the upstroke with a die or pattern, rough carving may be done. A few other uses of compressed air are the operation of fog sirens; the spraying of petroleum, as in the lucifer, or for the operations of welding, japanning, and tempering; agitation of asphalt in process of manufacture; agitation of sirups in refining sugar; mixing of acids in compounding nitroglycerin; painting with an atomizer in place of a brush; manufacture of cellulose silk, the pulp being forced through minute holes by pneumatic pressure; stimulating of natural-gas wells; inflating pneumatic tires; pumping of fluids from barrels; refining of silk ribbon; operation of sand blasts; increasing the pressure in hydraulic elevator tanks; working of indicators and bells; regulation of clocks; aëration of sewage; compression of other gases, as for lighting railway cars; production of oxygen and nitrogen by the Brin process; sanding of railway rails; raising of sunken vessels; and vulcanizing of timber.

CONGO FREE STATE, a sovereign, independent, monarchical state in Central Africa, created with the consent of the great powers and declared perpetually neutral in conformity with the general act of the Congo, signed at Berlin on Feb. 26, 1885. Leopold II, King of the Belgians, was declared its sovereign, and he by his will, dated Aug. 2, 1889, has ceded his sovereign rights to Belgium. By a convention made on July 3, 1890, Belgium acquired the right to annex the State after a period of ten years. By a codicil to the will, dated July 21, 1890, the territories of the state were declared to be inalienable. The convention was ratified by the Belgian Chambers on July 25, 1890. The Government, under King Leopold, is presided over by a single Secretary of State at Brussels, Edmond van Eetvelde, who is assisted by Dr. A. de Cuvelier as Secretary of Foreign Affairs, H. Pocheux as Treasurer, H. Droogmans as Secretary of Finance, and Charles Liebrechts as Secretary of the Interior, Public

Force, and Marine. The Governor General at Boma is Théodore Wahis.

Area and Population.—The area of the territories of the Congo State is estimated from 870,000 to 900,000 square miles, and the population from 14,000,000 to 30,000,000. The number of whites at the end of 1895 was 1,325, of whom 839 were Belgians, 88 English, 79 Swedes and Norwegians, 42 French, 49 Italians, 45 Americans, 39 Dutch, 21 Germans, 12 Danes, and 7 Swiss, Austrians, and Spaniards.

Finances.—The revenue for 1896 was estimated at 7,002,735 francs, of which 2,000,000 francs were advanced from the Belgian treasury, 1,000,000 francs contributed by the sovereign, 1,720,200 francs collected from customs, 40,800 francs obtained from sales and leases of land, 1,200,000 produced from domains and tribute and imposts paid in kind, and 1,041,735 francs received from various sources. The expenditures were estimated at 8,236,300 francs, of which 231,000 francs were for the central administration in Europe, 1,947,120 francs for administration in Africa, 4,820,763 francs for the public force, 596,738 francs for the marine, 614,437 francs for public works, 339,040 francs for agriculture, and 637,152 francs for various expenses. The revenue and expenditure for 1897 was estimated at 10,500,000 francs. The King gives the same contribution each year from his private purse, and the Belgian Government has been authorized to advance the sum of 2,000,000 francs annually till 1900.

The revenue for 1897 was 9,369,000 francs, of which 3,500,000 francs came from ivory and rubber, 2,000,000 francs from customs duties, 2,000,000 francs were advanced by the Belgian Government, 1,000,000 francs were contributed by the King, and 869,000 francs were miscellaneous receipts. The expenditures amounted to 10,141,800 francs, of which war and police absorbed nearly half, administration 1,538,000 francs, marine 941,000 francs, and public works 684,000 francs.

Public Force and Marine.—The armed force of the Free State is composed of native soldiers commanded by 172 European officers and 172 sergeants. The effective force for 1896 was fixed at 6,120 men, of whom 4,000 were recruited within the State.

The Government has 6 steamers plying on the lower Congo from the mouth to Matadi, and 14 on the upper Congo.

Commerce and Production.—The chief exportable products are palm oil, palm nuts, caoutchouc, ivory, orchilla weed, gum copal, ground nuts, and camwood. The imports are cotton goods, firearms, gunpowder, tobacco, and, within a limited territory, spirits. The general imports for 1895 were valued at 11,836,033 francs, against 11,854,021 francs in 1894, and the general exports at 12,135,636 francs, against 11,031,704 francs. The export of ivory in 1895 was 5,844,640 francs in value; caoutchouc, 2,882,585 francs; palm oil, 1,037,000 francs; palm nuts, 1,331,000 francs; coffee, 150,000 francs. Tobacco is grown by the natives in their villages, and plantations have been established by the Government. The cultivation of coffee has been introduced on the upper Congo. The trade is chiefly with Belgium, Great Britain, and Holland. Belgian imports in 1895 were valued at 6,099,938 francs, and exports to Belgium at 8,369,660 francs; imports from the Netherlands at 1,548,000 francs, and exports to the Netherlands at 885,000 francs; imports from Great Britain at 2,312,000 francs, and exports to Great Britain at 593,000 francs; imports from Germany at 920,000 francs, and exports to Germany at 218,000 francs; imports from the French Congo at 2,000 francs, and exports to the French Congo at 251,000 francs; imports

from the Portuguese possessions at 252,000 francs, and exports to Portuguese possessions at 1,189,000 francs; imports from other countries at 702,000 francs. In 1895 the number of vessels that visited Banana and Boma was 571, of 253,911 tons.

The imports in 1896 amounted to 16,000,000 francs, and the exports to 15,000,000 francs. Cotton stuffs and other manufactures come almost entirely from Belgium. Only 5,000,000 francs of the import and an equal amount of the export trade was with foreign countries. The spirit trade has decreased, and in 1896 formed only 1.37 per cent. of the entire value of the commerce. The sale of alcohol is forbidden throughout the State except on the lower Congo, and there it is subjected to the maximum tariff authorized by the act of Brussels. The laborious caravan route from Matadi to Stanley Pool is shortened one half by the railroad, and in 1899 the line will be completed. There were 7,000 men employed on the works in 1897, natives of Sierra Leone and other British West African colonies and of Senegal. In 1897 a decrease was noticed in the export trade, but there was a considerable increase in imports, representing chiefly expenditure by the Government, the religious missions, and the railroad company.

The Congo post office in 1895 forwarded 54,282 internal and 173,564 international letters.

Treatment of the Natives.—From the statements of missionary accusers of the Congo administration it appears that about the middle of 1893 forced labor was imposed on the natives, and this was attended with most inhuman practices. Soldiers are accustomed to shoot or mutilate any native who refuses to gather rubber. The State is said to still be engaged itself in the slave trade and to receive war indemnities in slaves. Prisoners captured in war are carried off to be trained as soldiers and to cultivate the property round the stations. Native armed sentinels, chosen from the wildest tribes, are placed in the towns to force the people to bring in rubber. In one district on the upper Congo, near Equatorville, 45 villages were burned by the black soldiery. Missionaries saw soldiers going to attack the village of Bompanga near Bolengi, their station, and heard the shots by which more than 20 people were killed, three quarters of their number women and children, and they saw the right hands of the killed taken back in a basket, for it is the practice to preserve the hands of such victims with smoke and return these trophies to the authorities to prove that the soldiers have not wasted their cartridges. When missionaries complained to the authorities of the dreadful carnage and devastation perpetrated by the troops in enforcing the collection of rubber, they were put off in most cases with evasions and no investigation was made, the matter being dragged along until the officials could say that it was an old story incapable of being sifted at such a late date. Sometimes, when they were insistent, the missionaries were themselves threatened with trial and penal servitude on the charge of inciting the natives to refuse to pay their tribute of rubber. After Col. Wahis had made a tour of the stations in July, 1896, and had, on asking the missionaries if they had any complaints to make, been informed of the Bompanga affair, which had already been the subject of a slighted investigation by Judge de Baecker, another village of the district, Mandaka-Vaiko, was similarly attacked and about 50 were killed, not because the natives refused to pay the tax but because they were accused of bringing in too much rubber, the supply of good rubber not being equal to the demand. It was a common thing to see sentinels carrying baskets of right hands of men, women, and children to the commissary.

Although the charges of the missionaries were passed over and discredited, their publication in Europe spurred the Governor General to more energetic action for the correction of abuses. Some soldiers and traders were punished for cruelty, and some of the worst officials were got rid of. The Congo State encourages the development of missions, both Catholic and Protestant, and the number of missionaries has increased sevenfold since the State was founded, being 233 in 1897, including 108 Protestants. Something has been done to put a stop to cannibalism and human sacrifice, which are constituted crimes by one of the decrees of the State. On the Ubangi the traffic in human victims has almost ceased; but on the upper Congo even Baron Dhanis is said to have given out rations of human flesh to his troops, and cannibalism has, according to some observers, been on the increase since Europeans appeared in the Congo basin. Some of the decrees of the State are in direct conflict with the Brussels act, such as the decree announcing the confiscation of all lands in which private property has not been recognized, and the one declaring that all products of domain lands belong to the State. There are, however, regulations leaving the natives in possession of all the land that they can cultivate, and allowing them to settle on vacant lands.

The freedom of navigation and commerce on the Congo has become a fiction since the State established a practical monopoly of rubber and ivory. The Government boasts, in spite of the severe criticism to which it has been subjected, that it has accomplished much for the civilization of Africa, summing up its work in the report for 1897 as follows: "The peril of the slave trade averted, a vast territory entirely opened to progress, centers of civilization springing up everywhere, roads being built, communications rendered easy and speedy, a railroad in course of completion, a flotilla sailing over all the course of the river and its tributaries, trade developing, missions flourishing, schools being opened, the population protected by justice and getting initiated to cultivation and handicrafts, their material and moral situation improving, Christian villages forming themselves, barbarous practices disappearing—such is the work of ten years." In September, 1896, six missionaries were constituted a commission that was charged with the protection of natives throughout the territory of the State, and authorized to notify to the judicial authorities such acts of violence of which the natives may be the victims as come within their cognizance. The president of the Court of Appeal has since been charged with the duty of making tours of inspection for the special purpose of enforcing the regulations for the proper treatment of the natives.

Military Operations.—The military forces of the Free State were operating in the early part of the year on the upper Congo and in the Nile territory leased from Egypt by arrangement with Great Britain. In January the guard stationed at Banzville, on the Ubangi, fired upon the French administrator from Mobaye, who crossed the river to secure the return of a woman captured by natives of the Free State. The French returned the fire, and several were wounded on both sides. The administration of the Congo State apologized to the French authorities and promised to punish the offenders.

An expedition under Capt. Chaltin, consisting of 700 soldiers, supplemented by 50 fusiliers and 560 lancers under native chiefs, leaving Dungen on Dec. 14, 1896, reached the site of Bedden, on the Nile, two months later, after engaging in some skirmishes with native tribes, and on Feb. 17 attacked 2,000 Mahdists who occupied a strong position. While

the enemy attempted to inclose the Congo State troops with the two flanks, these charged the center and carried a defile and the neighboring heights at the point of the bayonet, whereupon the Mahdists fled in the direction of Rejaf, abandoning their arms, ammunition, and baggage. The Congo troops marched 18 miles the same day, arriving in front of Rejaf, which was held by 4,000 Mahdists, half of whom were Mohammedans from the north armed with breech-loading rifles. After a severe engagement the dervishes were driven from their position and fled northward. They lost several hundred men. The Congo State troops captured 3 guns, 700 breech-loading rifles, an enormous quantity of ammunition, banners, sabers, the town archives, and many herds of domestic animals. Rejaf was found to be the only fortified place in the Equatorial Province, with spacious, well-built houses. Lado had ceased to exist seven years before, and its site was overgrown with vegetation. Vatako, Longomerri, and other stations had also disappeared. The defeated Mahdists made no attempt to recover the country, and were not seen or heard of more. The people were glad to be delivered from their yoke, and made their submission to the Congo State.

Supporting this expedition was a force of 200 Haussas and a small army of Congo natives, stationed at different points on the northeastern frontier to guard against incursions of the Mahdists. Baron Dhanis had brought up this force while Capt. Michaux with 500 picked troops was engaged in stamping out the rebellion of the Batatelas in the south. Mutilous Batatela troops, after organizing their first revolt at Luluaburg in 1895 and suffering defeat at the hands of Major Gillain and Capt. Lothaire in November of that year, succeeded in making their escape toward the south across impenetrable forests. Baron Dhanis organized a column at Kassongo, which was sent in pursuit under Capt. Michaux. This force proceeded southward to Munza, between the Lualaba and the Lomami, and there encountered the rebels on Nov. 11, 1896. After a preliminary skirmish a battle was fought in complete darkness, which ended in the flight and dispersion of the rebels. Capt. Michaux continued the campaign, coming up with the rebels again in January, 1897, when he gave them another severe defeat.

The bulk of the force taken to the north by Baron Dhanis consisted of Batatelas and Bakussus, impressed troops who were subjected to severe discipline by the trained soldiers from Sierra Leone and the middle Congo in order to keep them in order. The Batatelas were especially restive and morose on account of being taken so far from their homes to fight for the State in a strange country. They expected to be led next against the dervishes, and were afraid that they would never see their native land again. On the same day that Capt. Chaltin attacked Rejaf a battalion of 1,500 Batatelas and Bakussus, under a brother of Baron Dhanis, mutinied and killed their commander. Another column, led by Major Leroi, revolted near Ndursi, and after killing their chiefs the rebels marched off in the direction of the upper Ituri, where they were joined in March by the mutineers of Baron Dhanis's expedition. The rebels carried off 3,000 rifles and all the stores and ammunition of the expedition. They made their way to the south, toward their own country beyond the Arab zone, by way of the valley of the Semliki, occasionally crossing the border into the British sphere. During one of these incursions one of their detachments attacked the English fort of Katwe, which had been strengthened by 40 Congo State soldiers, who aided the small English garrison to repel the assault. The soldiers who remained faithful to Baron Dhanis

had several encounters with the mutineers, in one of which Lieut. Julien was killed. Baron Dhanis first led the loyal remnant of his force, consisting mainly of the 200 Haussas, back to the fort of Avakubis, where Lieut. Henri had a small garrison. Then the commander-in-chief returned by way of Stanley Falls to Nyangwe to organize a fresh force for the repression of the rebellion. Meanwhile the troops left in the north under Lieut. Henri, 600 in number, started in pursuit of the rebels. They were rejoined on June 12 at Mekupa by a force under Lieut. Saunnes, who had followed the traces of the rebels from Kilongalanga, on the Ituri. The Arabs recently disarmed at Stanley Falls were quiet, and the troops of Baron Dhanis held the routes to Nyangwe and to Kassenge in order to cut off the retreat of the Batatele mutineers.

CONGREGATIONALISTS. The following is a summary of the statistics of the Congregational churches in the United States as they are given in the "Congregational Yearbook" for 1897: Number of churches, 5,546, of which 4,250 are registered as "supplied" and 1,296 as "vacant"; number of ministers, 5,405, of whom 3,690 are returned as "in pastoral work" and 1,715 as "without charge"; number of members, 615,195; of members of Sunday schools, 697,373, and the average attendance at Sunday schools, 423,070; number of families, 417,485; of Young People's Societies of Christian Endeavor, 3,892, with 242,546 members; number of additions during the year on confession, 32,147; of baptisms, 14,881 of adults and 11,655 of children. Amount of contributions (4,837 churches reporting): For foreign missions, \$469,731; for education, \$179,238; for church building, \$98,062; for home missions, \$545,977; for the American Missionary Association, \$150,469; for Sunday schools, \$57,852; for ministerial aid, \$23,126; other contributions, \$596,001; total benevolent contributions, \$2,129,450; received from legacies, \$323,081. Contributions for home expenditures (1,758 churches reporting), \$6,871,128. These figures show increase over the previous year of 64 churches, 12,638 members, 4,995 members of Sunday schools, and \$463,575 in contributions for home expenditures, and a decrease of \$57,594 in benevolent contributions. The 7 theological seminaries return 64 professors, 25 instructors or lecturers, 24 resident licentiates or fellows, 23 advanced or graduate students, and 486 undergraduate students.

The receipts of the Congregational Church Building Society for 1896, as reported at its forty-fourth annual meeting in January, were \$132,968, and its available resources for the year were \$221,644. Its total disbursements were \$135,751. Aid had been voted on 140 houses of worship and 45 parsonages. Payments amounting to \$71,867 had been voted direct from the treasury toward the completion of 114 houses of worship, securing church property valued at \$235,975; and payments in the form of loans had been made toward the completion of 45 parsonages, securing \$42,486 of parsonage property. This brought the number of houses of worship aided by the society up to 2,775, and the number of parsonages to 569. Between May, 1892, and the end of December, 1896, the treasurer of the society had received \$97,933 in the form of contributions to the Parsonage Loan fund and \$132,522 in the form of parsonage loans refunded. The purpose of the board was to keep this fund constantly invested in parsonages. On Dec. 31, 1896, the Church Building Loan fund was \$319,759, and 110 churches had received aid from it. Of this fund, \$129,854 had been paid back, and \$189,905 were outstanding.

Education Society.—The annual report of the Congregational Education Society shows that during the year 321 students were assisted—106 in the colleges and 215 in the seminaries—a falling off

of 26, the decrease being mainly in the colleges. The society also gives assistance to a number of Western colleges, including Pacific University and Pomona, Salt Lake, Pacific Lutheran, Ridgeville, Rollins, and Fairmount colleges. Some of the high schools had been discontinued in the West, on account of the growth of the public schools. The receipts of the society for the year had been \$137,413, and the expenditures somewhat less, leaving a balance of about \$10,000.

Home Mission Society.—The seventy-first annual meeting of the Congregational Home Missionary Society was held in Saratoga Springs, N. Y., June 1. Gen. O. O. Howard presided. The receipts of the society for the year had been \$458,193, while the auxiliaries had raised and expended on their own fields \$230,215. The expenditures of the national society had been \$421,275, and of the auxiliaries \$230,215. The debt of the society had been increased from \$51,700, to \$127,505. The Woman's Unions had contributed \$45,550 to the treasury of the society. Two thousand and twenty-six missionaries had been employed in 44 States and Territories, supplying in whole or by preaching at stated intervals 3,691 congregations, of these, 214 had preached in foreign tongues, viz., 47 to German, 107 to Scandinavian, 22 to Bohemian, 4 to Polish, 13 to French, 1 to Mexican, 4 to Italian, 2 to Spanish, 4 to Finnish, 1 to Danish, 4 to Armenian, 1 to Greek, and 4 to Welsh congregations. The number of pupils in Sunday schools and Bible classes was not far from 172,784. Two hundred and thirty-eight new schools had been organized, and 2,638 schools were under the special care of the missionaries. The additions on confession of faith, so far as could be ascertained, numbered 7,942. One hundred and seven new churches had been organized, 38 had assumed entire self-support, 88 houses of worship had been completed, 182 materially repaired or improved, 4 chapels built, 62 parsonages provided, and 115 men in connection with the missionary churches were preparing for the ministry.

American Missionary Association.—The fifty-fifth annual meeting of the American Missionary Association was held in Minneapolis, Minn., Oct. 19, 20, and 21. President Merrill E. Gates, LL. D., of Amherst College, presided. The treasurer reported that the total receipts for the year ending Sept. 30 had been \$320,440, and the payments \$317,812. The debt had been reduced from \$66,572 to \$54,945. The year's receipts from the Women's missionary societies had been \$28,733. Forty-one schools had been aided wholly or in part from the income of the Daniel Hand fund (\$75,858), the accounts of which are kept separate from the general accounts of the association.

The Southern educational work of the association included 6 chartered institutions, 44 normal and graded schools, and 27 common schools—in all 77 schools—with 413 instructors and 12,348 pupils. Of the pupils, 69 were classified as theological, 70 as collegiate, 330 as collegiate preparatory, and 1,439 as normal. The condition of the colored people was represented as being one of steady advancement. Four of the graded and normal schools wholly under the care of colored teachers were mentioned in the report as presenting special features worthy of notice. The higher schools were University, Nashville, Tenn.; Talladega College, Alabama; Tougaloo University, Mississippi; Spelman University, New Orleans, La.; and Texas College, Austin, Texas—each reported a year of exceptional progress. The industrial education of these schools was constantly growing more important, and every year young men were being trained out of negro schools in the South who had been taught carpentry, shoemaking, printing, the general

al use of tools, and scientific farming in addition to the usual academic courses, and young women who had been taught cooking, washing, sewing, dress-making, nursing, and housekeeping. Eighteen mountain schools (included in the total of 77 schools) returned an enrollment of 2,195 pupils. These schools, besides their direct results, were exercising a healthy influence in creating a desire for a better education and larger intellectual growth, and in promoting a higher standard of instruction. The Orange Park School, Florida, was now free from the troubles from which it was suffering in the previous year (see "Annual Cyclopædia" for 1896, article CONGREGATIONALISTS). The church work in the South included 133 ministers and missionaries and 224 churches with 11,317 members. One thousand and sixteen members had been added by profession of faith, and 16,955 pupils were returned in church, mission, and Sunday schools. In all, 18 new churches had been organized, of which 12 were colored churches, 4 in the Southern mountains, and 2 in the Indian field. During the past five years 121 new churches had been added, of which 81 were colored churches, 35 were churches in the mountains, and 5 in the Indian fields. These churches had come into being independent of any direction or suggestion from the association. The 55 mountain churches had 1,619 members. Two local Congregational associations organized within the past few years among the mountain churches—the Cumberland Plateau Association, in Tennessee, and the Cumberland Valley Association, in Kentucky—were maintaining a vigorous existence. Seventeen churches were sustained among the Indians, and returned 971 members, 1,145 pupils in Sunday schools, and \$2,427 of benevolent collections. There were also connected with the Indian missions 26 missionary out stations, 86 missionaries and teachers, 37 of whom were Indians, and 23 schools with 592 pupils. The Indian missions were divided among the departments of Nebraska and the Dakotas—in which the 3 central training schools were situated—Montana (Fort Custer), Washington (Skokomish), and Alaska (Cape Prince of Wales). The churches, of which 2 had been added during the year, were mostly served by native pastors who went out from the Christian schools, while 4 white general missionaries superintended the work of the native pastors in the out stations. The Chinese missions comprised 20 schools, with 32 teachers, 7 of whom were Chinese, and 1,084 pupils, while 60 persons had made profession of faith during the year. The Chinese brethren, since the organization of their Chinese Missionary Society, in 1866, had contributed more than \$15,000 to missions in China. They were carrying on missionary work at Canton, with a property worth \$4,000, at Hong-Kong, where they had property valued at nearly \$10,000, and had organized an aggressive work from their chapel at Ci-Nung. Besides sustaining their three missions they had helped the American Board in China to start a number of chapels and free schools, and had contributed largely to the support of them. Their Christian Endeavor Society in San Francisco ranked as the third in the United States in contributions to foreign missions.

The American Board.—The eighty-eighth annual meeting of the American Board of Commissioners for Foreign Missions was held at New Haven, Conn., in October.

The treasurer's report showed that the total expenditure for the year had been \$688,414, of which \$636,299 represented the cost of missions, and that the board had been left \$45,150 in debt. The permanent fund amounted to \$240,734.

The general survey gives the following numbers: Of missions, 20; of stations, 101; of out sta-

tions, 1,126; of places for stated preaching, 1,501; average congregations, 63,264.

Laborers employed.—Number of ordained missionaries (15 being physicians), 174; of physicians not ordained (besides 10 women), 14; of other male assistants, 4; of women, 10 of them physicians (wives 176, unmarried 175), 351; whole number of laborers sent from the United States, 543; number of native pastors, 234; of native preachers and catechists, 546; of native school-teachers, 1,651; of other native laborers, 525; total of native laborers, 2,056; total of American and native laborers, 3,499.

The Churches.—Number of churches, 470; of church members, 44,606; added during the year, 3,919; whole number from the first, as nearly as can be learned, 138,790.

Educational Department.—Number of theological seminaries and station classes, 17, with 179 pupils; of colleges and high schools for young men, 57, with 3,388 pupils; of boarding schools for girls, 61, with 3,603 pupils; of common schools, 1,049, with 43,221 pupils; whole number under instruction, 54,615. Amount of native contributions so far as reported, \$113,039.

Owing to incomplete returns from Western and Eastern Turkey, the items from those missions in reference to churches and native agencies were taken from previous reports. In European Turkey, notwithstanding the war and the disturbances at Salonica and Monastir, and much hindrance to general travel, the mission work had held its own. In Eastern Turkey it had been more interrupted, and the care of orphans, 2,000 of whom had received protection, had laid heavy burdens on the missionaries. Yet the schools and churches had been thronged, and many places hitherto closed had been seeking spiritual help. The western and central missions in Turkey had held meetings for the first time in three years. The colleges at Constantinople, Marsovan, and Aintab and the high schools reported a successful year. In Bulgaria the work had considerably broadened; it had been very successful in Austria, Spain, and Mexico, and the growth of the Christian Endeavor societies in Spain and Mexico had been very noticeable. In India the doors were open on every hand. Great changes were shown in Japan, which was open everywhere. The East Central African Mission, now in its fourth year, had founded its first church, with 17 members. A revival of great power and extent had marked the progress of the Zulu mission. In Micronesia the situation was much improved, the missionaries had visited Ponape by special invitation of the Spanish governor, and visits had been paid to the Mortlock and Marshall islands. A rapidly and widely extending interest in Christianity was manifest in China; and in the Foochow mission, which had celebrated its jubilee, there had been more than 2,000 inquirers, while the 548 additions to the churches were almost 50 per cent. of the number reported in the previous year, and more than the total number in the mission five years preceding.

The Rev. R. S. Storrs, D. D., president of the board, having expressed a desire to retire from that office on account of his age, a committee was appointed to nominate a candidate to be his successor. The committee unanimously agreed to suggest the name of the Rev. C. D. Lamson, D. D., of Hartford, Conn., and he was unanimously elected president of the board. A special paper was presented by the Prudential Committee calling attention to the stringency in the financial affairs of the missions and the failure of the churches to contribute adequately to the needs of the work, and asking advice as to how the emergency should be met. Should the missions to papal lands be given up? Should some of the older missions be left to take care of

themselves? or should the educational work be reduced? The resolution passed in answer to these questions deprecated the adoption of any policy that should pay less attention to education, and recommended that the questions of contracting the missions to Roman Catholic countries be referred to a large committee which should confer with the missionaries in the field and dispatch deputations to India and China. The meeting was addressed by the Rev. Dr. F. E. Clark, President of the United Societies of Christian Endeavor, John R. Mott, President of the Student Volunteer Movement, and the Rev. Dr. J. H. Barrows, of Chicago, all of whom had lately visited Protestant missions abroad, and gave accounts of what they had observed among them. A committee appointed to inquire concerning the election of women as corporate members of the board and as members of the Prudential Committee reported that no legal or constitutional impediment stood in the way of such election, and the subject was referred for further consideration to a committee which was instructed to report at the next meeting of the board. A subscription taken during the meeting toward paying the debt of \$45,000, resulted in securing pledges for \$31,000.

British Congregationalists.—The annual meeting of the Congregational Union of England and Wales was held in London, beginning May 10. The Rev. Dr. Charles A. Berry presided, and the Rev. Alfred Rowland was chosen chairman for the next year. The report of the committee referred to the improved financial resources of the Church Aid Society, and mentioned the sending out by the Colonial Missionary Society of English ministers to Newfoundland and the native churches of Jamaica. A handbook of the Church history of the early Christian churches had been prepared by Prof. Adeney, and was on sale, and was to be followed by a summary of the story of the English Free Churches, by Mr. Johnson Evans. The Congregational Union lecture, by Dr. John Brown, on apostolic succession, was to be published in the fall. A new constitution for the Young People's Union, which had been approved by the General Committee, was intended greatly to widen the area of operations. It provides for the establishment of a central council and district branches, with the purpose of promoting the formation of such societies and their federation for increased efficiency and co-operation. All Congregational young people's societies formed on a religious basis are included in the scheme. The report of the Church Extension Committee gave a list of new churches begun and arranged for by the county associations. They involved a local expenditure of about £40,000. The Central fund was making less progress than the local funds had done. The income of the Church Aid Society had risen to £1,100 more than in the previous year, and the stipends of the village pastors had been raised in some cases to £100 and in others to £90, while the minimum had not been suffered to fall below £80. The opening address of the chairman, the Rev. Dr. Berry, was on "Congregational Churchmanship." Resolutions were passed concerning the education question and international arbitration, and expressing sympathy with those who were suffering from the burning of the Charity Bazaar in Paris.

The autumnal meeting of the union was held at Birmingham beginning Oct. 12, the Rev. Dr. C. A. Berry presiding. A resolution was adopted affirming that the assembly, pained by many indications of the development of sacerdotal claims and sacramental superstitions in the country, recognized an imperative obligation to reaffirm the judgment respecting those matters which was universal in the Congregational churches. It did not apprehend that the Roman Catholic communion was becoming

more formidable; but it observed, with profound sorrow, that within the pale of the Church of England, which was constitutionally a Protestant body, and was often regarded as a bulwark of Protestantism, there had grown up a conservative party which did not inculcate, but sought to salvert, the scriptural doctrines of the Reformation, claimed for their ministry sacerdotal and sacramental functions belonging of right to the Lord Jesus Christ, and had introduced into the public services of the Church of England a mass of ritualistic observances which as were associated with the services of the Church of Rome. Even the two archbishops, in their reply to the letter of Pope Leo XIII, while rejecting his claims, acknowledged the Tridentine Council, and argued that the ministers of the Church of England were also a sacrificing priesthood. The assembly, while desiring to cultivate unity and co-operation with Christians in every place, regarded these sacerdotal claims and ritualistic practices with stern disapprobation. The assembly earnestly declared its unshaken loyalty to the Protestant faith, which it regarded as being the embodiment of the revelation of God and the palladium of their civil and religious liberties, and called on all Christians to combat and repudiate sacerdotalism. A resolution bearing reference to the dispute which was going on at the time among the engineering trades of the country deprecated the resort to strikes and lockouts, and expressed the conviction of the assembly that the gravest responsibility rests upon the leaders of all trade federations, whether of employers or employed, to seek to submit their differences to arbitration before the dispute has become such as can be settled only by the humiliation of one of the parties. It further expressed gratitude at the growth of public sentiment which had led to an act of Parliament authorizing the Board of Trade to intervene in trade differences. Another resolution emphatically condemned the educational policy of the Government during the previous session as "encouraging the endeavor to put the education of the country into the hands of the Established Church; and repeating the opinion that there could be no settlement of the educational difficulty until all schools supported out of public funds were placed under the control of local boards elected by popular suffrage." A letter conveying brotherly greeting and the wish that the deliberations of the assembly might be guided by the Holy Spirit was received from the Bishop of Worcester, to which a suitable reply was returned.

The John Robinson Memorial Church, so called in memory of the pastor of the Pilgrims of the Mayflower, in the erection of which the Congregational Union had cooperated, was dedicated at Gainsborough, June 9.

London Missionary Society.—The annual meeting of the London Missionary Society was held in London May 10. Mr. Stephen Massey presided. The treasurer's report represented that the society had received a smaller income than in the previous year and yet had had to incur a larger expenditure. The entire receipts for the year had been £146,232, of which £10,639 had been for the Centenary fund and £21,008 had been raised and appropriated at mission stations, thus reducing the free contributions to £115,184. Distinct from these figures were two special funds—the Indian Famine fund, from which £5,606 had been received, and the Bechuanaland Relief fund, which had brought in £603. The missions included 191 men and 70 single women, European missionaries, 24,473 members (omitting the churches in Madagascar), 143,252 adherents, 37,178 children in Sunday schools, and 15 hospitals and dispensaries, treating 117,952 patients.

CONGRESS. The second session of the Fifty-fourth Congress began Monday, Dec. 7, 1896, and on notification that both houses were ready to receive any communication, the President sent in the following message:

To the Congress of the United States:

As representatives of the people in the legislative branch of their Government, you have assembled at a time when the strength and excellence of our free institutions and the fitness of our citizens to enjoy popular rule have been again made manifest. A political contest involving momentous consequences, fraught with feverish apprehension, and creating aggressiveness so intense as to approach bitterness and passion, has been waged throughout our land, and determined by the decree of free and independent suffrage, without disturbance of our tranquillity or the least sign of weakness in our national structure.

When we consider these incidents and contemplate the peaceful obedience and manly submission which have succeeded a heated clash of political opinions, we discover abundant evidence of a determination on the part of our countrymen to abide by every verdict of the popular will, and to be controlled at all times by an abiding faith in the agencies established for the direction of the affairs of their Government.

Thus our people exhibit a patriotic disposition which entitles them to demand of those who undertake to make and execute their laws such faithful and unselfish service in their behalf as can only be prompted by a serious appreciation of the trust and confidence which the acceptance of public duty invites.

In obedience to a constitutional requirement, I herein submit to the Congress certain information concerning national affairs, with the suggestion of such legislation as in my judgment is necessary and expedient. To secure brevity and avoid tiresome narration, I shall omit many details concerning matters within Federal control, which, though by no means unimportant, are more profitably discussed in departmental reports. I shall also further curtail this communication by omitting a minute recital of many minor incidents connected with our foreign relations which have heretofore found a place in Executive messages, but are now contained in a report of the Secretary of State, which is herewith submitted.

At the outset of a reference to the more important matters affecting our relations with foreign powers, it would afford me satisfaction if I could assure the Congress that the disturbed condition in Asiatic Turkey had during the past year assumed a less hideous and bloody aspect, and that either as a consequence of the awakening of the Turkish Government to the demands of humane civilization, or as the result of decisive action on the part of the great nations having the right by treaty to interfere for the protection of those exposed to the rage of mad bigotry and cruel fanaticism, the shocking features of the situation had been mitigated. Instead, however, of welcoming a softened disposition or protective intervention, we have been afflicted by continued and not unfrequent reports of the wanton destruction of homes and the bloody butchery of men, women, and children, made martyrs to their profession of Christian faith.

While none of our citizens in Turkey have thus far been killed or wounded, though often in the midst of dreadful scenes of danger, their safety in the future is by no means assured. Our Government at home and our minister at Constantinople have left nothing undone to protect our missionaries in Ottoman territory, who constitute nearly

all the individuals residing there who have a right to claim our protection on the score of American citizenship. Our efforts in this direction will not be relaxed; but the deep feeling and sympathy that have been aroused among our people ought not to so far blind their reason and judgment as to lead them to demand impossible things. The outbreaks of blind fury which lead to murder and pillage in Turkey occur suddenly and without notice, and an attempt on our part to force such a hostile presence there as might be effective for prevention or protection would not only be resisted by the Ottoman Government, but would be regarded as an interruption of their plans by the great nations who assert their exclusive right to intervene in their own time and method for the security of life and property in Turkey.

Several naval vessels are stationed in the Mediterranean as a measure of caution and to furnish all possible relief and refuge in case of emergency.

We have made claims against the Turkish Government for the pillage and destruction of missionary property at Harpoot and Marash during uprisings at those places. Thus far the validity of these demands has not been admitted, though our minister, prior to such outrages and in anticipation of danger, demanded protection for the persons and property of our missionary citizens in the localities mentioned, and notwithstanding that strong evidence exists of actual complicity of Turkish soldiers in the work of destruction and robbery.

The facts as they now appear do not permit us to doubt the justice of these claims, and nothing will be omitted to bring about their prompt settlement.

A number of Armenian refugees having arrived at our ports, an order has lately been obtained from the Turkish Government permitting the wives and children of such refugees to join them here. It is hoped that hereafter no obstacle will be interposed to prevent the escape of all those who seek to avoid the perils which threaten them in Turkish dominions.

Our recently appointed consul to Erzerum is at his post and discharging the duties of his office, though for some unaccountable reason his formal *exequatur* from the Sultan has not been issued.

I do not believe that the present somber prospect in Turkey will be long permitted to offend the sight of Christendom. It so mars the humane and enlightened civilization that belongs to the close of the nineteenth century that it seems hardly possible that the earnest demand of good people throughout the Christian world for its corrective treatment will remain unanswered.

The insurrection in Cuba still continues with all its perplexities. It is difficult to perceive that any progress has thus far been made toward the pacification of the island, or that the situation of affairs as depicted in my last annual message has in the least improved. If Spain still holds Havana and the seaports and all the considerable towns, the insurgents still roam at will over at least two thirds of the inland country. If the determination of Spain to put down the insurrection seems but to strengthen with the lapse of time, and is evinced by her unhesitating devotion of largely increased military and naval forces to the task, there is much reason to believe that the insurgents have gained in point of numbers, and character, and resources, and are none the less inflexible in their resolve not to succumb, without practically securing the great objects for which they took up arms. If Spain has not yet re-established her authority, neither have the insurgents yet made good their title to be regarded as an independent state. Indeed, as the contest has gone on, the pretense that civil government exists on the island, except so far as Spain is

able to maintain it, has been practically abandoned. Spain does keep on foot such a government, more or less imperfectly, in the large towns and their immediate suburbs. But, that exception being made, the entire country is either given over to anarchy or is subject to the military occupation of one or the other party. It is reported, indeed, on reliable authority that, at the demand of the commander in chief of the insurgent army, the putative Cuban Government has now given up all attempt to exercise its functions, leaving that Government confusedly (what there is the best reason for supposing it always to have been in fact) a government merely on paper.

Were the Spanish armies able to meet their antagonists in the open or in pitched battle, prompt and decisive results might be looked for, and the immense superiority of the Spanish forces in numbers, discipline, and equipment could hardly fail to tell greatly to their advantage. But they are called upon to face a foe that shuns general engagements, that can choose and does choose its own ground, that from the nature of the country is visible or invisible at pleasure, and that fights only from ambushes and when all the advantages of position and numbers are on its side. In a country where all that is indispensable to life in the way of food, clothing, and shelter is so easily obtainable, especially by those born and bred on the soil, it is obvious that there is hardly a limit to the time during which hostilities of this sort may be prolonged. Meanwhile, as in all cases of protracted civil strife, the passions of the combatants grow more and more inflamed and excesses on both sides become more frequent and more deplorable. They are also participated in by bands of marauders, who, now in the name of one party and now in the name of the other, as may best suit the occasion, harry the country at will and plunder its wretched inhabitants for their own advantage. Such a condition of things would inevitably entail immense destruction of property even if it were the policy of both parties to prevent it as far as practicable. But while such seemed to be the original policy of the Spanish Government, it has now apparently abandoned it and is acting upon the same theory as the insurgents, namely, that the exigencies of the contest require the wholesale annihilation of property, that it may not prove of use and advantage to the enemy.

It is to the same end that in pursuance of general orders Spanish garrisons are now being withdrawn from plantations and the rural population required to concentrate itself in the towns. The sure result would seem to be that the industrial value of the island is fast diminishing, and that unless there is a speedy and radical change in existing conditions it will soon disappear altogether. That value consists very largely, of course, in its capacity to produce sugar—a capacity already much reduced by the interruptions to tillage which have taken place during the last two years. It is reliably asserted that should these interruptions continue during the current year and practically extend, as is now threatened, to the entire sugar-producing territory of the island, so much time and so much money will be required to restore the land to its normal productivity that it is extremely doubtful if capital can be induced to even make the attempt.

The spectacle of the utter ruin of an adjoining country, by nature one of the most fertile and charming on the globe, would engage the serious attention of the Government and people of the United States in any circumstances. In point of fact, they have a concern with it which is by no means of a wholly sentimental or philanthropic character. It lies so near to us as to be hardly

separated from our territory. Our actual pecuniary interest in it is second only to that of the people and Government of Spain. It is reasonably estimated that at least from \$30,000,000 to \$50,000,000 of American capital are invested in plantations and in railroad, mining, and other business enterprises on the island. The volume of trade between the United States and Cuba, which in 1889 amounted to about \$54,000,000, rose in 1893 to about \$103,000,000, and in 1894, the year before the present insurrection broke out, amounted to nearly \$96,000,000. Besides this large pecuniary stake in the fortunes of Cuba, the United States finds itself inextricably involved in the present contest in other ways both vexatious and costly.

Many Cubans reside in this country and indirectly promote the insurrection through the press, by public meetings, by the purchase and shipment of arms, by the raising of funds, and by other means, which the spirit of our institutions and the tenor of our laws do not permit to be made the subject of criminal prosecutions. Some of them, though Cubans at heart and in all their feelings and interests, have taken out papers as naturalized citizens of the United States, a proceeding resorted to with a view to possible protection by this Government, and not unnaturally regarded with much indignation by the country of their origin. The insurgents are undoubtedly encouraged and supported by the widespread sympathy the people of this country always and instinctively feel for every struggle for better and freer government, and which, in the case of the more adventurous and restless elements of our population, leads in only too many instances to active and personal participation in the contest. The result is that this Government is constantly called upon to protect American citizens, to claim damages for injuries to persons and property, now estimated at many millions of dollars, and to ask explanations and apologies for the acts of Spanish officials, whose zeal for the repression of rebellion sometimes blinds them to the immunities belonging to the unoffending citizens of a friendly power. It follows from the same causes that the United States is compelled to actively police a long line of seacoast against unlawful expeditions, the escape of which the utmost vigilance will not always suffice to prevent.

These inevitable entanglements of the United States with the rebellion in Cuba, the large American property interests affected, and considerations of philanthropy and humanity in general, have led to a vehement demand in various quarters for some sort of positive intervention on the part of the United States. It was at first proposed that belligerent rights should be accorded to the insurgents—a proposition no longer urged because untimely and in practical operation clearly perilous and injurious to our own interests. It has since been and is now sometimes contended that the independence of the insurgents should be recognized. But imperfect and restricted as the Spanish government of the island may be, no other exists there—unless the will of the military officer in temporary command of a particular district can be dignified as a species of government. It is now also suggested that the United States should buy the island—a suggestion possibly worthy of consideration if there were any evidence of a desire or willingness on the part of Spain to entertain such a proposal. It is urged, finally, that, all other methods failing, the existing internecine strife in Cuba should be terminated by our intervention, even at the cost of a war between the United States and Spain—a war which its advocates confidently prophesy could be neither large in its proportions nor doubtful in its issue.

The correctness of this forecast need be neither

affirmed nor denied. The United States has nevertheless a character to maintain as a nation, which plainly dictates that right and not might should be the rule of its conduct. Further, though the United States is not a nation to which peace is a necessity, it is in truth the most pacific of powers, and desires nothing so much as to live in amity with all the world. Its own ample and diversified domains satisfy all possible longings for territory, preclude all dreams of conquest, and prevent any casting of covetous eyes upon neighboring regions, however attractive. That our conduct toward Spain and her dominions has constituted no exception to this national disposition is made manifest by the course of our Government, not only thus far during the present insurrection, but during the ten years that followed the rising at Yara in 1868. No other great power, it may safely be said, under circumstances of similar perplexity, would have manifested the same restraint and the same patient endurance. It may also be said that this persistent attitude of the United States toward Spain in connection with Cuba unquestionably evinces no slight respect and regard for Spain on the part of the American people. They in truth do not forget her connection with the discovery of the Western Hemisphere, nor do they underestimate the great qualities of the Spanish people, nor fail to fully recognize their splendid patriotism and their chivalrous devotion to the national honor.

They view with wonder and admiration the cheerful resolution with which vast bodies of men are sent across thousands of miles of ocean and an enormous debt accumulated, that the costly possession of the Gem of the Antilles may still hold its place in the Spanish crown. And yet neither the Government nor the people of the United States have shut their eyes to the course of events in Cuba, or have failed to realize the existence of conceded grievances which have led to the present revolt from the authority of Spain—grievances recognized by the Queen Regent, and by the Cortes, voiced by the most patriotic and enlightened of Spanish statesmen, without regard to party, and demonstrated by reforms proposed by the executive and approved by the legislative branches of the Spanish Government. It is in the assumed temper and disposition of the Spanish Government to remedy these grievances, fortified by indications of influential public opinion in Spain, that this Government has hoped to discover the most promising and effective means of composing the present strife, with honor and advantage to Spain, and with the achievement of all the reasonable objects of the insurrection.

It would seem that if Spain should offer to Cuba genuine autonomy—a measure of home rule which, while preserving the sovereignty of Spain, would satisfy all rational requirements of the Spanish subjects—there should be no just reason why the pacification of the island might not be effected on that basis. Such a result would appear to be in the true interest of all concerned. It would at once stop the conflict which is now consuming the resources of the island and making it worthless for whichever party may ultimately prevail. It would keep intact the possessions of Spain without touching her honor, which will be consulted rather than impugned by the adequate redress of admitted grievances. It would put the prosperity of the island and the fortunes of its inhabitants within their own control, without severing the natural and ancient ties which bind them to the mother country, and would yet enable them to test their capacity for self-government under the most favorable conditions. It has been objected on the one side that Spain should not promise autonomy until her insurgent subjects lay down their arms; on the other

side, that promised autonomy, however liberal, is insufficient, because without assurance of the promise being fulfilled. But the reasonableness of a requirement by Spain, of unconditional surrender on the part of the insurgent Cubans before their autonomy is conceded, is not altogether apparent. It ignores important features of the situation—the stability two years' duration has given to the insurrection; the feasibility of its indefinite prolongation in the nature of things, and as shown by past experience; the utter and imminent ruin of the island, unless the present strife is speedily composed; above all the rank abuses which all parties in Spain, all branches of her Government, and all her leading public men concede to exist and profess a desire to remove. Facing such circumstances, to withhold the proffer of needed reforms until the parties demanding them put themselves at mercy by throwing down their arms, has the appearance of neglecting the gravest of perils and inviting suspicion as to the sincerity of any professed willingness to grant reforms.

The objection on behalf of the insurgents—that promised reforms can not be relied upon—must of course be considered, though we have no right to assume, and no reason for assuming, that anything Spain undertakes to do for the relief of Cuba will not be done according to both the spirit and the letter of the undertaking.

Nevertheless, realizing that suspicions and precautions on the part of the weaker of two combatants are always natural and not always unjustifiable—being sincerely desirous in the interest of both, as well as on its own account, that the Cuban problem should be solved with the least possible delay—it was intimated by this Government to the Government of Spain some months ago that, if a satisfactory measure of home rule were tendered the Cuban insurgents, and would be accepted by them upon a guarantee of its execution, the United States would endeavor to find a way not objectionable to Spain of furnishing such guarantee. While no definite response to this intimation has yet been received from the Spanish Government, it is believed to be not altogether unwelcome, and, as already suggested, no reason is perceived why it should not be approved by the insurgents. Neither party can fail to see the importance of early action; and both must realize that to prolong the present state of things for even a short period will add enormously to the time and labor and expenditure necessary to bring about the industrial recuperation of the island. It is therefore fervently hoped that earnest efforts for healing the breach between Spain and the insurgent Cubans upon the lines above indicated, may be at once inaugurated and pushed to an immediate and successful issue. The friendly office of the United States, either in the manner above outlined or in any other way consistent with our Constitution and laws, will always be at the disposal of either party.

Whatever circumstances may arise, our policy and our interests would constrain us to object to the acquisition of the island or an interference with its control by any other power. It should be added that it can not be reasonably assumed that the hitherto expectant attitude of the United States will be indefinitely maintained. While we are anxious to accord all due respect to the sovereignty of Spain, we can not view the pending conflict in all its features, and properly apprehend our inevitable close relations to it, and its possible results, without considering that by the course of events we may be drawn into such an unusual and unprecedented condition as will fix a limit to our patient waiting for Spain to end the contest, either alone and in her own way or with our friendly co-

operation. When the inability of Spain to deal successfully with the insurrection has become manifest, and it is demonstrated that her sovereignty is extinct in Cuba for all purposes of its rightful existence, and when a hopeless struggle for its re-establishment has degenerated into a strife, which means nothing more than the useless sacrifice of human life and the utter destruction of the very subject-matter of the conflict, a situation will be presented in which our obligations to the sovereignty of Spain will be superseded by higher obligations, which we can hardly hesitate to recognize and discharge. Deferring the choice of ways and methods until the time for action arrives, we should make them depend upon the precise conditions then existing, and they should not be determined upon without giving careful heed to every consideration involving our honor and interest, or the international duty we owe to Spain. Until we face the contingencies suggested, or the situation is by other incidents imperatively changed, we should continue in the line of conduct heretofore pursued, thus in all circumstances exhibiting our obedience to the requirements of public law and our regard for the duty enjoined upon us by the position we occupy in the family of nations. A contemplation of emergencies that may arise should plainly lead us to avoid their creation, either through a careless disregard of present duty or even an undue stimulation and ill-timed expression of feeling. But I have deemed it not amiss to remind the Congress that a time may arrive when a correct policy and care for our interests—as well as a regard for the interests of other nations and their citizens, joined by considerations of humanity and a desire to see a rich and fertile country, intimately related to us, saved from complete devastation—will constrain our Government to such action as will subserve the interests thus involved and at the same time promise to Cuba and its inhabitants an opportunity to enjoy the blessings of peace.

The Venezuelan boundary question has ceased to be a matter of difference between Great Britain and the United States, their respective governments having agreed upon the substantial provisions of a treaty between Great Britain and Venezuela submitting the whole controversy to arbitration. The provisions of the treaty are so eminently just and fair that the assent of Venezuela thereto may confidently be anticipated.

Negotiations for a treaty of general arbitration for all differences between Great Britain and the United States are far advanced, and promise to reach a successful consummation at an early date.

During the past year 35 appointments have been made in the consular service, 27 of which were made to fill vacancies caused by death or resignation or to supply newly created posts, 2 to succeed incumbents removed for cause, 2 for the purpose of displacing alien consular officials by American citizens, and 4 merely changing the official title of incumbent from commercial agent to consul. Twelve of these appointments were transfers or promotions from other positions under the Department of State; 4 of these appointed had rendered previous service under the department; 8 were made of persons who passed a satisfactory examination.

The scheme of examining applicants for certain consular positions to test their competency and fitness, adopted under an executive order issued on Sept. 20, 1893, has fully demonstrated the usefulness of this innovation. In connection with this plan of examination, promotions and transfers of deserving incumbents have been quite extensively made, with excellent results.

Seven were appointed to places not included in the order of Sept. 20, 1893, and 4 appointments, as above stated, involved no change of incumbency. The inspection of consular officers, provided for by an appropriation for that purpose at the last session of the Congress, has been productive of such wholesome effects that I hope this important work will in the future be continued. I know of nothing that can be done with the same slight expense so improving to the service. I desire to repeat the recommendation, contained in my last annual message, in favor of providing at public expense official residences for our ambassadors and ministers at foreign capitals. The reasons supporting this recommendation are strongly stated in the report of the Secretary of State, and the subject seems of such importance that I hope it may receive the early attention of the Congress.

We have during the last year labored faithfully and against unfavorable conditions to secure better preservation of seal life in the Bering Sea. Both the United States and Great Britain have lately dispatched commissioners to these waters to study the habits and condition of the seal herd and the causes of their rapid decrease. Upon the reports of these commissioners, soon to be submitted, and with the exercise of patience and good sense on the part of all interested parties, it is earnestly hoped that hearty co-operation may be secured for the protection against threatened extinction of seal life in the northern Pacific and Bering Sea.

The Secretary of the Treasury reports that during the fiscal year ended June 30, 1896, the receipts of the Government from all sources amounted to \$409,475,408.78. During the same period its expenditures were \$434,678,654.48, the excess of expenditures over receipts thus amounting to \$25,203,245.70. The ordinary expenditures during the year were \$4,015,832.21 less than during the preceding fiscal year. Of the receipts mentioned there was derived from customs the sum of \$160,021,751.67, and from internal revenue \$146,890,615.66. The receipts from customs show an increase of \$7,863,184.22 over those from the same source for the fiscal year ended June 30, 1895, and the receipts from internal revenue an increase of \$3,584,537.91.

The value of our imported dutiable merchandise during the last fiscal year was \$369,757,470, and the value of free goods imported \$409,967,470, being an increase of \$6,523,675 in the value of dutiable goods, and \$41,231,634 in the value of free goods over the preceding year. Our exports of merchandise, foreign and domestic, amounted in value to \$882,606,938, being an increase over the preceding year of \$75,068,773. The average *ad valorem* duty paid on dutiable goods imported during the year was 39.94 per cent., and on free and dutiable goods taken together 20.55 per cent.

The cost of collecting our internal revenue was 2.78 per cent., as against 2.81 per cent. for the fiscal year ended June 30, 1895. The total production of distilled spirits, exclusive of fruit brandies, was 86,588,703 taxable gallons, being an increase of 6,639,108 gallons over the preceding year. There was also an increase of 1,443,676 gallons of spirits produced from fruit, as compared with the preceding year. The number of barrels of beer produced was 35,859,250, as against 33,589,784 produced in the preceding fiscal year, being an increase of 2,269,466 barrels.

The total amount of gold exported during the last fiscal year was \$112,409,947, and of silver \$60,541,670, being an increase of \$45,941,466 of gold and \$13,246,384 of silver over the exportations of the preceding fiscal year. The imports of gold were \$33,525,065, and of silver \$28,777,186, being

\$2,859,695 less of gold and \$8,566,007 more of silver than during the preceding year.

The total stock of metallic money in the United States at the close of the last fiscal year ended on the 30th day of June, 1896, was \$1,228,326,035, of which \$599,597,964 was in gold and \$628,728,071 in silver.

On the 1st day of November, 1896, the total stock of money of all kinds in the country was \$2,285,410,590, and the amount in circulation, not including that in the Treasury holdings, was \$1,627,055,641, being \$22.63 *per capita* upon an estimated population of 71,902,000.

The production of the precious metals in the United States during the calendar year 1895 is estimated to have been 2,254,760 fine ounces of gold, of the value of \$46,610,000, and 55,727,000 fine ounces of silver, of the commercial value of \$36,445,000 and the coinage value of \$72,051,000. The estimated production of these metals throughout the world during the same period was 9,688,821 fine ounces of gold, amounting to \$200,285,700 in value, and 169,189,249 fine ounces of silver, of the commercial value of \$110,654,000 and of the coinage value of \$218,738,100 according to our ratio.

The coinage of these metals in the various countries of the world during the same calendar year amounted to \$232,701,438 in gold and \$121,996,219 in silver.

The total coinage at the mints of the United States during the fiscal year ended June 30, 1896, amounted to \$71,188,468.52, of which \$58,878,490 was in gold coins and \$12,309,978.52 in standard silver dollars, subsidiary coins, and minor coins.

The number of national banks organized from the time the law authorizing their creation was passed up to Oct. 31, 1896, was 5,051, and of this number 3,769 were at the date last mentioned in active operation, having authorized capital stock of \$650,014,895, held by 288,902 shareholders, and circulating notes amounting to \$211,412,620.

The total outstanding circulating notes of all national banks on the 31st day of October, 1896, amounted to \$234,553,807, including unredeemed but fully secured notes of banks insolvent and in process of liquidation. The increase in national-bank circulation during the year ending on that day was \$21,099,429. On Oct. 6, 1896, when the condition of national banks was last reported, the total resources of the 3,679 active institutions was \$3,263,685,313.83, which included \$1,893,268,839.31 in loans and discounts and \$362,165,733.85 in money of all kinds on hand. Of their liabilities \$1,597,891,058.73 was due to individual depositors, and \$209,944,019 consisted of outstanding circulating notes.

There were organized during the year preceding the date last mentioned 28 national banks, located in 15 States, of which 12 were organized in the Eastern States with a capital of \$1,180,000, 6 in the Western States with a capital of \$875,000, and 10 in the Southern States with a capital of \$1,190,000. During the year, however, 37 banks voluntarily abandoned their franchises under the national law, and in the case of 27 others it was found necessary to appoint receivers. Therefore, as compared with the year preceding, there was a decrease of 36 in the number of active banks.

The number of existing banks organized under State laws is 5,708.

The number of immigrants arriving in the United States during the fiscal year was 343,267, of whom 340,468 were permitted to land, and 2,799 were debarred, on various grounds prescribed by law, and returned to the countries whence they came at the expense of the steamship companies by which they were brought in. The increase in immigration

over the preceding year amounted to 84,731. It is reported that with some exceptions the immigrants of the past year were of a hardy laboring class, accustomed and able to earn a support for themselves, and it is estimated that the money brought with them amounted to at least \$5,000,000, though it was probably much in excess of that sum, since only those having less than \$30 are required to disclose the exact amount, and it is known that many brought considerable sums of money to buy land and build homes. Including all the immigrants arriving who were over fourteen years of age, 28.63 per cent. were illiterate, as against 20.37 per cent. of those of that age arriving during the preceding fiscal year. The number of immigrants over fourteen years old, the countries from which they came, and the percentage of illiterates among them, were as follow: Italy, 57,515, with 54.59 per cent.; Ireland, 37,496, with 7 per cent.; Russia, 35,188, with 41.14 per cent.; Austria-Hungary and provinces, 57,053, with 38.92 per cent.; Germany, 25,334, with 2.96 per cent.; Sweden, 18,821, with 1.16 per cent.; while from Portugal there came 2,067, of whom 77.69 per cent. were illiterate. There arrived from Japan during the year only 1,110 immigrants, and it is the opinion of the immigration authorities that the apprehension heretofore existing to some extent of a large immigration from Japan to the United States is without any substantial foundation.

From the Life-Saving Service it is reported that the number of disasters to documented vessels within the limits of its operations during the year was 437. These vessels had on board 4,608 persons, of whom 4,595 were saved and 13 lost. The value of such vessels is estimated at \$8,880,140, and of their cargoes \$3,846,380, making the total value of property imperiled \$12,726,520. Of this amount \$11,292,707 was saved and \$1,432,750 was lost. Sixty-seven of the vessels were totally wrecked. There were besides 243 casualties to small undocumented craft, on board of which there were 594 persons, of whom 587 were saved and 7 were lost. The value of the property involved in these latter casualties is estimated at \$119,265, of which \$114,915 was saved and \$4,350 was lost. The life-saving crews during the year also rescued or assisted numerous other vessels and warned many from danger by signals, both by day and night. The number of disasters during the year exceeded that of any previous year in the history of the service, but the saving of both life and property was greater than ever before in proportion to the value of the property involved and to the number of persons imperiled.

The operations of the Marine-Hospital Service, the Revenue-Cutter Service, the Steamboat-Inspection Service, the Lighthouse Service, the Bureau of Navigation, and other branches of public work attached to the Treasury Department, together with various recommendations concerning their support and improvement, are fully stated in the report of the Secretary of the Treasury, to which the attention of the Congress is especially invited.

The report of the Secretary of War exhibits satisfactory conditions in the several branches of the public service intrusted to his charge.

The limit of our military force, as fixed by law, is constantly and readily maintained. The present discipline and *morale* of our army are excellent, and marked progress and efficiency are apparent throughout its entire organization.

With the exception of delicate duties in the suppression of slight Indian disturbances along our southwestern boundary, in which the Mexican troops co-operated, and the compulsory but peaceful return, with the consent of Great Britain, of a band of Cree Indians from Montana to the British posses-

done, no active operations have been required of the army during the year past.

Changes in methods of administration, the abandonment of unnecessary posts and consequent concentration of troops, and the exercise of care and vigilance by the various officers charged with the responsibility, in the expenditure of the appropriations, have resulted in reducing to a minimum the cost of maintenance of our military establishment.

During the past year the work of constructing permanent infantry and cavalry posts has been continued at the places heretofore designated. The Secretary of War repeats his recommendation that appropriations for barracks and quarters should more strictly conform to the needs of the service as judged by the department rather than respond to the wishes and importunities of localities. It is imperative that much of the money provided for such construction should now be allotted to the erection of necessary quarters for the garrisons assigned to the coast defenses, where many men will be needed to properly care for and operate modern guns. It is essential, too, that early provision be made to supply the necessary force of artillery to meet the demands of this service.

The entire army has now been equipped with the new magazine arms, and wise policy demands that all available public and private resources should be employed as to provide within a reasonable time a sufficient number to supply the state militia with these modern weapons and provide an ample reserve for any emergency.

The organized militia numbers 112,879 men. The appropriations for its support by the several States approximate \$2,800,000 annually, and \$400,000 is contributed by the General Government. Investigation shows these troops to be usually well drilled and inspired with much military interest, but in many instances they are so deficient in proper arms and equipment that a sudden call to active duty would find them inadequately prepared for field service. I therefore recommend that prompt measures be taken to remedy this condition and that every encouragement be given to this deserving body of unpaid and voluntary citizen soldiers upon whose assistance we must largely rely in time of trouble.

During the past year rapid progress has been made toward the completion of the scheme adopted for the erection and armament of fortifications along our seacoast, while equal progress has been made in improving the material for submarine defense in connection with these works.

It is peculiarly gratifying at this time to note the great advance that has been made in this important undertaking since the date of my annual message to the Fifty-third Congress at the opening of its second session in December, 1893. At that time I informed the Congress of the approaching completion of 9 12-inch, 30 10-inch, and 30 40-inch high steel guns and 75 12-inch rifled mortars. This total then seemed insignificant when compared with the great work remaining to be done. Yet it was none the less a source of satisfaction to every citizen when he reflected that it represented the first installment of the new ordnance of American design and American manufacture, and demonstrated our ability to supply from our own resources guns of unexcelled power and accuracy. At that date, however, there were practically no carriages upon which to mount these guns, and only 31 emplacements for guns and 64 for mortars. Nor were all these emplacements in condition to receive their armament. Only one high-power gun was at that time in position for the defense of the entire coast.

Since that time the number of guns actually completed has been increased to a total of 21 12-inch,

56 10-inch, 61 8-inch high-power breech-loading steel guns, 10 rapid-fire guns, and 80 12-inch rifled mortars. In addition there are in process of construction 1 16-inch type gun, 15 12-inch, 56 10-inch, 27 8-inch high-power guns, and 66 12-inch rifled mortars; in all, 428 guns and mortars.

During the same year immediately preceding the message referred to the first modern gun carriage had been completed and eleven more were in process of construction. All but one were of the non-disappearing type. These, however, were not such as to secure necessary cover for the artillery gunners against the intense fire of modern machine rapid-fire and high-power guns.

The inventive genius of ordnance and civilian experts has been taxed in designing carriages that would obviate this fault, resulting, it is believed, in the solution of this difficult problem. Since 1893 the number of gun carriages constructed or building has been raised to a total of 129, of which 90 are on the disappearing principle, and the number of mortar carriages to 152, while the 95 emplacements which were provided for prior to that time have been increased to 280 built and building. This improved situation is largely due to the recent generous response of Congress to the recommendations of the War Department. Thus we shall soon have complete about one fifth of the comprehensive system, the first step in which was noted in my message to the Congress of Dec. 4, 1893.

When it is understood that a masonry emplacement not only furnishes a platform for the heavy modern high-power gun, but also in every particular serves the purpose and takes the place of the fort of former days, the importance of the work accomplished is better comprehended.

In the hope that the work will be prosecuted with no less vigor in the future, the Secretary of War has submitted an estimate by which, if allowed, there will be provided and either built or building by the end of the next fiscal year such additional guns, mortars, gun carriages and emplacements, as will represent not far from one third of the total work to be done under the plan adopted for our coast defenses, thus affording a prospect that the entire work will be substantially completed within six years. In less time than that, however, we shall have attained a marked degree of security. The experience and results of the past year demonstrate that with a continuation of present careful methods the cost of the remaining work will be much less than the original estimate.

We should always keep in mind that of all forms of military preparation, coast defense alone is essentially pacific in its nature. While it gives the sense of security due to a consciousness of strength, it is neither the purpose nor the effect of such permanent fortification to involve us in foreign complications, but rather to guarantee us against them. They are not temptation to war, but security against it. Thus they are thoroughly in accord with all the traditions of our national diplomacy.

The Attorney-General presents a detailed and interesting statement of the work done under his supervision during the last fiscal year. The ownership and management by the Government of penitentiaries for the confinement of those convicted in United States courts for violations of Federal laws, which for many years has been a subject of executive recommendation, has at last to a slight extent been realized by the utilization of the abandoned military prison at Fort Leavenworth as a United States penitentiary.

This is certainly a movement in the right direction; but it ought to be at once supplemented by the rebuilding or extensive enlargement of this improvised prison, and the construction of at least one

more, to be located in the Southern States. The capacity of the Leavenworth Penitentiary is so limited that the expense of its maintenance, calculated at a *per capita* rate upon the number of prisoners it can accommodate, does not make as economical an exhibit as it would if it were larger and better adapted to prison purposes; but I am thoroughly convinced that economy, humanity, and a proper sense of responsibility and duty toward those whom we punish for violations of Federal law dictates that the Federal Government should have the entire control and management of the penitentiaries where convicted violators are confined.

It appears that since the transfer of the Fort Leavenworth military prison to its new uses the work previously done by prisoners confined there, and for which expensive machinery has been provided, has been discontinued. This work consisted of the manufacture of articles for army use now done elsewhere. On all grounds it is exceedingly desirable that the convicts confined in this penitentiary be allowed to resume work of this description.

It is most gratifying to note the satisfactory results that have followed the inauguration of the new system provided for by the act of May 28, 1896, under which certain Federal officials are compensated by salaries instead of fees. The new plan was put in operation the 1st day of July, 1896, and already the great economy it enforces, its prevention of abuses, and its tendency to a better enforcement of the laws, are strikingly apparent. Detailed evidence of the usefulness of this long-delayed but now happily accomplished reform will be found clearly set forth in the Attorney-General's report.

Our Post Office Department is in good condition, and the exhibit made of its operations during the fiscal year ended June 30, 1896, if allowance is made for imperfections in the laws applicable to it, is very satisfactory. The total receipts during the year were \$82,499,208.40. The total expenditures were \$90,626,296.84, exclusive of \$1,559,898.27, which was earned by the Pacific Railroad for transportation and credited on their debt to the Government. There was an increase of receipts over the previous year of \$5,516,080.21, or 7.1 per cent., and an increase of expenditures of \$3,836,124.02, or 4.42 per cent.

The deficit was \$1,679,956.19 less than that of the preceding year. The chief expenditures of the postal service are regulated by law and are not in the control of the Postmaster-General. All that he can accomplish by the most watchful administration and economy is to enforce prompt and thorough collection and accounting for public moneys and such minor savings in small expenditures and in letting those contracts, for post-office supplies and star service, which are not regulated by statute.

An effective co-operation between the auditor's office and the Post Office Department and the making and enforcement of orders by the department requiring immediate notification to their sureties of all delinquencies on the part of postmasters and compelling such postmasters to make more frequent deposits of postal funds, have resulted in a prompter auditing of their accounts and much less default to the Government than heretofore.

The year's report shows large extensions of both star-route service and railway mail service, with increased postal facilities. Much higher accuracy in handling mails has also been reached, as appears by the decrease of errors in the railway mail service and the reduction of mail matter returned to the dead-letter office.

The deficit for the last year, although much less

than that of the previous and preceding years, emphasizes the necessity for legislation to correct the growing abuse of second-class rates, to which the deficiency is mainly attributable.

The transmission at the rate of 1 cent a pound of serial libraries, advertising sheets, "house organs" (periodicals advertising some particular "house" or institution), sample copies, and the like ought certainly to be discontinued. A glance at the revenues received for the work done last year will show more plainly than any other statement the gross abuse of the postal service and the growing waste of its earnings.

The free matter carried in the mails for the departments, offices, etc., of the Government, and for Congress, in pounds, amounted to 94,480,189.

If this is offset against buildings for post offices and stations, the rental of which would more than compensate for such free postal service, we have this exhibit of the weight of mail matter (other than above) transmitted through the mail for the year ending June 30, 1896:

CLASS.	Weight.	Revenue.
	Pounds.	
1. Domestic and foreign letters and postal cards, etc.....	65,337,343	\$60,624,464
2. Newspapers and periodicals, 1 cent per pound.....	348,988,648	2,996,400
3. Books, seeds, etc., 8 cents a pound.....	78,701,148	10,324,069
4. Parcels, etc., 16 cents a pound.....	19,950,187	3,129,321
Total.....	512,977,326	\$77,044,257

The remainder of our postal revenue, amounting to something more than \$5,000,000, was derived from box rents, registry fees, money-order business, and other similar items.

The entire expenditures of the department, including pay for transportation credited to the Pacific railroads, was \$92,186,195.11, which may be considered as the cost of receiving, carrying, and delivering the above mail matter. It thus appears that though the second-class matter constituted more than two thirds of the total that was carried, the revenue derived from it was less than one thirtieth of the total expense.

The average revenue from each pound of first-class matter was..... 93 cents
 From each pound of second-class..... 84 mills
 (Of the second-class, 52,348,297 was county-free matter.)
 From each pound of third-class..... 13.1 cents
 From each pound of fourth-class..... 15.6 "

The growth in weight of second-class matter has been from 299,000,000 pounds in 1894 to 312,000,000 in 1895, and to almost 349,000,000 in 1896, and it is quite evident this increasing drawback is far outstripping any possible growth of postal revenues.

Our mail service should of course be such as to meet the wants and even the conveniences of our people, at a direct charge upon them so light as perhaps to exclude the idea of our Post Office Department being a money-making concern; but in the face of a constantly recurring deficiency in its revenues, and in view of the fact that we supply the best mail service in the world, it seems to me it is quite time to correct the abuses that swell enormously our annual deficit. If we concede the public policy of carrying weekly newspapers free in the county of publication, and even the policy of carrying at less than one tenth of their cost other *bona fide* newspapers and periodicals, there can be no excuse for subjecting the service to the further immense and increasing loss involved in carrying at the nominal rate of 1 cent a pound the serial libraries, sometimes including trashy and even harmful literature, and other matter which, under the loose

interpretation of a loose statute, has been gradually given second-class rates, thus absorbing all profitable returns derived from first-class matter, which pays three or four times more than its cost, and producing a large annual loss, to be paid by general taxation. If such second-class matter paid merely the cost of its handling our deficit would disappear and a surplus result which might be used to give the people still better mail facilities or cheaper rates of letter postage. I recommend that legislation be at once enacted to correct these abuses and introduce better business ideas in the regulation of our postal rates.

Experience and observation have demonstrated that certain improvements in the organization of the Post Office Department must be secured before we can gain the full benefit of the immense sums expended in its administration. This involves the following reforms, which I earnestly recommend:

There should be a small addition to the existing inspector service, to be employed in the supervision of the carrier force, which now numbers 13,000 men and performs its service practically without the surveillance exercised over all other branches of the postal or public service. Of course such a lack of supervision and freedom from wholesome disciplinary restraints must inevitably lead to imperfect service. There should also be appointed a few inspectors who could assist the central office in necessary investigation concerning matters of post-office leases, post-office sites, allowances for rent, fuel, and lights, and in organizing and securing the best results from the work of the 14,000 clerks now employed in first- and second-class offices.

I am convinced that the small expense attending the inauguration of these reforms would actually be a profitable investment.

I especially recommend such a recasting of the appropriations by Congress for the Post Office Department as will permit the Postmaster-General to proceed with the work of consolidating post offices. This work has already been entered upon sufficiently to fully demonstrate, by experiment and experience, that such consolidation is productive of better service, larger revenues, and less expenditures, to say nothing of the further advantage of gradually withdrawing post offices from the spoils system.

The Universal Postal Union, which now embraces all the civilized world, and whose delegates will represent 1,000,000,000 people, will hold its fifth congress in the city of Washington in May, 1897. The United States may be said to have taken the initiative which led to the first meeting of this congress at Bern in 1874, and the formation of the Universal Postal Union, which brings the postal service of all countries to every man's neighborhood, and has wrought marvels in cheapening postal rates and securing absolutely safe mail communication throughout the world. Previous congresses have met in Bern, Paris, Lisbon, and Vienna, and the respective countries in which they have assembled have made generous provision for their accommodation and for the reception and entertainment of the delegates.

In view of the importance of this assemblage and of its deliberations, and of the honors and hospitalities accorded to our representatives by other countries on similar occasions, I earnestly hope that such an appropriation will be made for the expenses necessarily attendant upon the coming meeting in our capital city as will be worthy of our national hospitality and indicative of our appreciation of the event.

The work of the Navy Department and its present condition are fully exhibited in the report of the Secretary.

The construction of vessels for our new navy has been energetically prosecuted by the present administration upon the general lines previously adopted, the department having seen no necessity for radical changes in prior methods under which the work was found to be progressing in a manner highly satisfactory. It has been decided, however, to provide in every shipbuilding contract that the builder should pay all trial expenses, and it has also been determined to pay no speed premiums in future contracts. The premiums recently earned and some yet to be decided are features of the contracts made before this conclusion was reached.

On March 4, 1893, there were in commission but 2 armored vessels, the double-turreted monitors "Miantonomoh" and "Monterey." Since that date, of vessels theretofore authorized, there have been placed in their first commission 3 first-class and 2 second-class battle ships, 2 armored cruisers, 1 harbor-defense ram, and 5 double-turreted monitors, including the "Maine" and the "Puritan," just completed. Eight new unarmored cruisers and 2 new gunboats have also been commissioned. The "Iowa," another battle ship, will be completed about March 1, and at least 4 more gunboats will be ready for sea in the early spring.

It is gratifying to state that our ships and their outfits are believed to be equal to the best that can be manufactured elsewhere, and that such notable reductions have been made in their cost as to justify the statement that quite a number of vessels are now being constructed at rates as low as those that prevail in European shipyards.

Our manufacturing facilities are at this time ample for all possible naval contingencies. Three of our Government navy yards, those at Mare Island, Cal., Norfolk, Va., and Brooklyn, N. Y., are equipped for shipbuilding, our ordnance plant in Washington is equal to any in the world, and at the torpedo station we are successfully making the highest grades of smokeless powder. Three first-class private shipyards, at Newport News, Philadelphia, and San Francisco, are building battle ships; 11 contractors, situated in the States of Maine, Rhode Island, Pennsylvania, New Jersey, Maryland, Virginia, and the State of Washington, are constructing gunboats or torpedo boats; 2 plants are manufacturing large quantities of first-class armor; and American factories are producing automobile torpedoes, powder, projectiles, rapid-fire guns, and everything else necessary for the complete outfit of naval vessels.

There have been authorized by Congress since March, 1893, 5 battle ships, 6 light-draught gunboats, 16 torpedo boats, and 1 submarine torpedo boat. Contracts for the building of all of them have been let. The Secretary expresses the opinion that we have for the present a sufficient supply of cruisers and gunboats, and that hereafter the construction of battle ships and torpedo boats will supply our needs.

Much attention has been given to the methods of carrying on departmental business. Important modifications in the regulations have been made, tending to unify the control of shipbuilding, as far as may be, under the Bureau of Construction and Repair, and also to improve the mode of purchasing supplies for the navy by the Bureau of Supplies and Accounts. The establishment, under recent acts of Congress, of a supply fund, with which to purchase these supplies in large quantities and other modifications of methods have tended materially to their cheapening and better quality.

The war college has developed into a institution which it is believed will be of great value to the navy in teaching the science of war as well as in stimulating professional zeal in the navy; and it

will be especially useful in the devising of plans for the utilization, in case of necessity, of all the naval resources of the United States.

The Secretary has persistently adhered to the plan he found in operation for securing labor at navy yards through boards of labor employment, and has done much to make it more complete and efficient.

The naval officers who are familiar with this system and its operation express the decided opinion that its results have been to vastly improve the character of the work done at our yards and greatly reduce its cost.

Discipline among the officers and men of the navy has been maintained to a high standard, and the percentage of American citizens enlisted has been very much increased.

The Secretary is considering, and will formulate during the coming winter, a plan for laying up ships in reserve, thereby largely reducing the cost of maintaining our vessels afloat.

This plan contemplates that battle ships, torpedo boats, and such of the cruisers as are not needed for active service at sea shall be kept in reserve with skeleton crews on board to keep them in condition, cruising only enough to insure the efficiency of the ships and their crews in time of activity. The economy to result from this system is too obvious to need comment.

The naval militia, which was authorized a few years ago, as an experiment, has now developed into a body of enterprising young men, active and energetic in the discharge of their duties and promising great usefulness. This establishment has nearly the same relation to our navy as the National Guard in the different localities bears to our army, and constitutes a source of supply for our naval forces the importance of which is immediately apparent.

The report of the Secretary of the Interior presents a comprehensive and interesting exhibit of the numerous and important affairs committed to his supervision. It is impossible in this communication to do more than briefly refer to a few of the subjects concerning which the Secretary gives full and instructive information.

The money appropriated on account of this department and for its disbursement for the fiscal year ended June 30, 1896, amounted to more than \$157,000,000, or a greater sum than was appropriated for the entire maintenance of the Government for the two fiscal years ended June 30, 1861.

Our public lands, originally amounting to 1,840,000,000 acres, have been so reduced that only about 600,000,000 acres still remain in Government control, excluding Alaska. The balance, being by far the most valuable portion, has been given away to settlers, to new States, and to railroads, or sold at a comparatively nominal sum.

The patenting of land in execution of railroad grants has progressed rapidly during the year, and since the 4th day of March, 1893, about 25,000,000 acres have thus been conveyed to these corporations.

I agree with the Secretary that the remainder of our public lands should be more carefully dealt with and their alienation guarded by better economy and greater prudence.

The commission appointed from the membership of the National Academy of Sciences, provided for by an act of Congress to formulate plans for a national forestry system, will, it is hoped, soon be prepared to present the result of thorough and intelligent examination of this important subject.

The total Indian population of the United States is 177,235, according to a census made in 1895, exclusive of those within the State of New York and

those comprising the five civilized tribes. Of this number there are approximately 38,000 children of school age. During the year 23,393 of these were enrolled in schools. The progress which has attended recent efforts to extend Indian school facilities and the anticipation of continued liberal appropriations to that end can not fail to afford the utmost satisfaction to those who believe that the education of Indian children is a prime factor in the accomplishment of Indian civilization.

It may be said in general terms that in every particular the improvement of the Indians under Government care has been most marked and encouraging. The Secretary, the Commissioner of Indian Affairs, and the agents having charge of Indians to whom allotments have been made, strongly urge the passage of a law prohibiting the sale of liquor to allottees who have taken their lands in severalty. I earnestly join in this recommendation and venture to express the hope that the Indian may be speedily protected against this greatest of all obstacles to his well-being and advancement. The condition of affairs among the five civilized tribes, who occupy large tracts of land in the Indian Territory, and who have governments of their own, has assumed such an aspect as to render it almost indispensable that there should be an entire change in the relations of these Indians to the General Government. This seems to be necessary in furtherance of their own interests, as well as for the protection of non-Indian residents in their territory. A commission organized and empowered under several recent laws is now negotiating with these Indians for the relinquishment of their courts and the division of their common lands in severalty, and aiding in the settlement of the troublesome question of tribal membership. The reception of their first proffers of negotiation was not encouraging; but through patience and such conduct on their part as demonstrated that their intentions were friendly and in the interest of the tribes the prospect of success has become more promising. The effort should be to save these Indians from the consequences of their own mistakes and improvidence, and to secure to the real Indian his rights as against intruders and professed friends who profit by his retrogression. A change is also needed to protect life and property through the operation of courts conducted according to strict justice and strong enough to enforce their mandates. As a sincere friend of the Indian I am exceedingly anxious that these reforms should be accomplished with the consent and aid of the tribes, and that no necessity may be presented for radical or drastic legislation. I hope, therefore, that the commission now conducting negotiations will soon be able to report that progress has been made toward a friendly adjustment of existing difficulties.

It appears that a very valuable deposit of gilsonite or asphaltum has been found on the reservation in Utah occupied by the Ute Indians. Every consideration of care for the public interest and every sensible business reason dictates such management or disposal of this important source of public revenue as will except it from the general rules and incidents attending the ordinary disposition of public lands, and assure to the Government a fair share at least of its advantages in place of its transfer for a nominal sum to interested individuals.

I indorse the recommendation made by the present Secretary of the Interior, as well as his predecessor, that a permanent commission, consisting of three members, one of whom shall be an army officer, be created to perform the duties now devolving upon the Commissioner and Assistant Commissioner of Indian Affairs. The management of the

human involves such numerous and diverse details and the advantages of an uninterrupted policy are so apparent that I hope the change suggested will meet the approval of the Congress.

The diminution of our enormous pension roll and the decrease of pension expenditure, which have been so often confidently foretold, still fail in material realization. The number of pensioners on the rolls at the close of the fiscal year ended June 30, 1897, was 970,678. This is the largest ever reported. The amount paid exclusively for the pensions during the year was \$158,214,761.94, a slight decrease from that of the preceding year, while the total expenditures on account of pensions, including the cost of maintaining the department and expenses attending pension distribution, amounted to \$162,906,550.59, or within a very small fraction of one third of the entire expense of supporting the Government during the same year. The number of new pension certificates issued was 90,640. Of these, 40,374 represent original allowances of claims and 15,878 increases of existing pensions.

The number of persons receiving pensions from the United States, but residing in foreign countries, at the close of the last fiscal year was 3,781, and the amount paid to them during the year was \$22,733.28.

The sum appropriated for the payment of pensions for the current fiscal year ending June 30, 1897, is \$140,000,000 and for the succeeding year it is estimated that the same amount will be necessary. The Commissioner of Pensions reports that during the last fiscal year 339 indictments were found against violators of the pension laws. Upon these indictments 167 convictions resulted.

In my opinion, based upon such statements as these and much other information and observation, the abuses which have been allowed to creep into our pension system have done incalculable harm in demoralizing our people and undermining good citizenship. I have endeavored within my sphere of official duty to protect our pension roll and make it what it should be, a roll of honor, containing the names of those disabled in their country's service and worthy of their country's affectionate remembrance.

When I have seen those who pose as the soldiers' friends active and alert in urging greater laxity and more reckless pension expenditure, while nursing selfish schemes, I have depreciated the approach of a situation when necessary retrenchment and enforced economy may lead to an attack upon pension abuses, so determined as to overlook the discrimination due to those who, worthy of a nation's care, ought to live and die under the protection of a nation's gratitude.

The Secretary calls attention to the public interests involved in an adjustment of the obligations of the Pacific railroads to the Government. I deem it to be an important duty to especially present this subject to the consideration of the Congress.

On Jan. 1, 1897, with the amount already matured, more than \$13,000,000 of the principal of the subsidy bonds issued by the United States in aid of the construction of the Union Pacific Railway, including its Kansas line, and more than \$6,000,000 of like bonds, issued in aid of the Central Pacific Railroad, including those issued to the Western Pacific Railroad Company, will have fallen due and been paid or must on that day be paid by the Government. Without any reference to the application of the sinking fund now in the Treasury, this will create such a default on the part of these companies to the Government as will give it the right to at once institute proceedings to foreclose its mortgage lien. In addition to this indebtedness, which will be due Jan. 1, 1897, there will mature

between that date and Jan. 1, 1899, the remaining principal of such subsidy bonds, which must also be met by the Government. These amount to more than \$20,000,000 on account of Union Pacific lines, and exceed \$21,000,000 on account of the Central Pacific lines.

The situation of these roads and the condition of their indebtedness to the Government have been fully set forth in the reports of various committees to the present and prior Congresses, and as early as 1887 they were thoroughly examined by a special commission appointed pursuant to an act of Congress. The considerations requiring an adjustment of the Government's relations to the companies have been clearly presented, and the conclusion reached with practical uniformity that if these relations are not terminated they should be revised upon a basis securing their safe continuance.

Under section 4 of the act of Congress passed March 3, 1887, the President is charged with the duty, in the event that any mortgage or other incumbrance paramount to the interest of the United States in the property of the Pacific railroads shall exist and be lawfully liable to be enforced, to direct the action of the Departments of the Treasury and of Justice in the protection of the interest of the United States by redemption or through judicial proceedings, including foreclosures of the Government liens.

In view of the fact that the Congress has for a number of years almost constantly had under consideration various plans for dealing with the conditions existing between these roads and the Government, I have thus far felt justified in withholding action under the statute above mentioned.

In the case of the Union Pacific Company, however, the situation has become especially and immediately urgent. Proceedings have been instituted to foreclose a first mortgage upon those aided parts of the main lines upon which the Government holds a second and subordinate mortgage lien. In consequence of those proceedings and increased complications, added to the default occurring on Jan. 1, 1897, a condition will be presented at that date, so far as this company is concerned, that must emphasize the mandate of the act of 1887 and give to executive duty under its provisions a more imperative aspect. Therefore, unless Congress shall otherwise direct or shall have previously determined upon a different solution of the problem, there will hardly appear to exist any reason for delaying beyond the date of the default above mentioned such executive action as will promise to subserve the public interests and save the Government from the loss threatened by further inaction.

The Department of Agriculture is so intimately related to the welfare of our people and the prosperity of our nation that it should constantly receive the care and encouragement of the Government. From small beginnings it has grown to be the center of agricultural intelligence and the source of aid and encouragement to agricultural efforts. Large sums of money are annually appropriated for the maintenance of this department, and it must be confessed that the legislation relating to it has not always been directly in the interest of practical farming, or properly guarded against waste and extravagance. So far, however, as public money has been appropriated fairly and sensibly to help those who actually till the soil, no expenditure has been more profitably made or more generally approved by the people.

Under the present management of the department its usefulness has been enhanced in every direction, and at the same time strict economy has been enforced to the utmost extent permitted by congressional action. From the report of the Sec-

retary it appears that through careful and prudent financial management he has annually saved a large sum from his appropriations, aggregating during his incumbency and up to the close of the present fiscal year nearly one fifth of the entire amount appropriated. These results have been accomplished by a conscientious study of the real needs of the farmer and such a regard for economy as the genuine farmer ought to appreciate, supplemented by a rigid adherence to civil-service methods in a department which should be conducted in the interest of agriculture instead of partisan politics.

The Secretary reports that the value of our exports of farm products during the last fiscal year amounted to \$570,000,000, an increase of \$17,000,000 over those of the year immediately preceding. This statement is not the less welcome because of the fact that, notwithstanding such increase, the proportion of expected agricultural products to our total exports of all descriptions fell off during the year. The benefits of an increase in agricultural exports being assured, the decrease in its proportion to our total exports is the more gratifying when we consider that it is owing to the fact that such total exports for the year increased more than \$75,000,000.

The large and increasing exportation of our agricultural products suggests the great usefulness of the organization lately established in the department for the purpose of giving to those engaged in farming pursuits reliable information concerning the condition, needs, and advantages of different foreign markets. Inasmuch as the success of the farmer depends upon the advantageous sale of his products, and inasmuch as foreign markets must largely be the destination of such products, it is quite apparent that a knowledge of the conditions and wants that affect those markets ought to result in sowing more intelligently and reaping with a better promise of profit. Such information points out the way to a prudent foresight in the selection and cultivation of crops and to a release from the bondage of unreasoning monotony of production, a glutted and depressed market, and constantly recurring unprofitable toil.

In my opinion the gratuitous distribution of seeds by the department as at present conducted ought to be discontinued. No one can read the statement of the Secretary on this subject and doubt the extravagance and questionable results of this practice. The professed friends of the farmer, and certainly the farmers themselves, are naturally expected to be willing to rid a department devoted to the promotion of farming interests of a feature which tends so much to its discredit.

The Weather Bureau, now attached to the Department of Agriculture, has continued to extend its sphere of usefulness, and by an uninterrupted improvement in the accuracy of its forecasts has greatly increased its efficiency as an aid and protection to all whose occupations are related to weather conditions.

Omitting further reference to the operations of the department, I commend the Secretary's report and the suggestions it contains to the careful consideration of the Congress.

The progress made in civil-service reform furnishes a cause for the utmost congratulation. It has survived the doubts of its friends as well as the rancor of its enemies, and has gained a permanent place among the agencies destined to cleanse our politics and to improve, economize, and elevate the public service.

There are now in the competitive classified service upward of 84,000 places. More than half of these have been included from time to time since March 4, 1893. A most radical and sweeping ex-

tension was made by executive order dated the 6th day of May, 1896, and if fourth-class postmaster-ships are not included in the statement it may be said that practically all positions contemplated by the civil-service law are now classified. Abundant reasons exist for including these postmaster-ships, based upon economy, improved service, and the peace and quiet of neighborhoods. If, however, obstacles prevent such action at present, I earnestly hope that Congress will, without increasing post-office appropriations, so adjust them as to permit in proper cases a consolidation of these post offices, to the end that through this process the result desired may to a limited extent be accomplished.

The civil-service rules as amended during the last year provide for a sensible and uniform method of promotion, basing eligibility to better positions upon demonstrated efficiency and faithfulness. The absence of fixed rules on this subject has been an infirmity in the system more and more apparent as its other benefits have been better appreciated.

The advantages of civil-service methods in their business aspects are too well understood to require argument. Their application has become a necessity to the executive work of the Government. But those who gain positions through the operation of these methods should be made to understand that the nonpartisan scheme through which they receive their appointments demands from them, by way of reciprocity, nonpartisan and faithful performance of duty under every administration, and cheerful fidelity to every chief. While they should be encouraged to decently exercise their rights of citizenship and support through their suffrages the political beliefs they honestly profess, the noisy, pestilent, and partisan employee, who loves political turmoil and contention, or who renders lax and grudging service to an administration not representing his political views, should be promptly and fearlessly dealt with in such a way as to furnish a warning to others who may be likewise disposed.

The annual report of the commissioners will be duly transmitted, and I commend the important matter they have in charge to the careful consideration of the Congress.

The Interstate Commerce Commission has, during the last year, supplied abundant evidence of its usefulness and the importance of the work committed to its charge.

Public transportation is a universal necessity, and the question of just and reasonable charges therefor has become of vital importance not only to shippers and carriers, but also to the vast multitude of producers and consumers.

The justice and equity of the principles embodied in the existing law passed for the purpose of regulating these charges are everywhere conceded, and there appears to be no question that the policy thus entered upon has a permanent place in our legislation.

As the present statute when enacted was, in the nature of the case, more or less tentative and experimental, it was hardly expected to supply a complete and adequate system. While its wholesome effects are manifest and have amply justified its enactments, it is evident that all desired reforms in transportation methods have not been fully accomplished.

In view of the judicial interpretation which some provisions of this statute have received and the defects disclosed by the efforts made for its enforcement, its revision and amendment appear to be essential to the end that it may more effectually reach the evils designed to be corrected.

I hope the recommendations of the commission upon this subject will be promptly and favorably considered by the Congress.

I desire to recur to the statements elsewhere made concerning the Government's receipts and expenditures for the purpose of venturing upon some suggestions touching our present tariff law and its operation.

This statute took effect on the 28th day of August, 1894. Whatever may be its shortcomings as a complete measure of tariff reform, it must be conceded that it has opened the way to a freer and greater exchange of commodities between us and other countries, and thus furnished a wider market for our products and manufactures.

The only entire fiscal year ending during which this law has been in force ended on the 30th day of June, 1896. In that year our imports increased over those of the previous year more than \$6,500,000, while the value of the domestic products we exported, and which found markets abroad, was nearly \$70,000,000 more than during the preceding year.

Those who insist that the cost to our people of articles coming to them from abroad for their needful use should only be increased through tariff charges to an extent necessary to meet the expenses of the Government, as well as those who claim that tariff charges may be laid upon such articles beyond the necessities of Government revenue, and with the additional purpose of so increasing their price in our markets as to give American manufacturers and producers better and more profitable opportunities, must agree that our tariff laws are only primarily justified as sources of revenue to enable the Government to meet the necessary expenses of its maintenance. Considered as to its sufficiency in this aspect, the present law can by no means fall under just condemnation. During the only complete fiscal year of its operation it has yielded nearly \$8,000,000 more revenue than was received from tariff duties in the preceding year. There was, nevertheless, a deficit between our receipts and expenditures more than \$25,000,000. This, however, was not unexpected. The situation was such in December last, seven months before the close of the fiscal year, that the Secretary of the Treasury foretold a deficiency of \$17,000,000. The great and increasing apprehension and timidity in business circles, and the depression in all activities intervening since that time resulting from causes perfectly well understood and entirely disconnected with our tariff law or its operation, seriously checked the imports we would have otherwise received and readily account for the difference between this estimate of the Secretary and the actual deficiency as well as for a continued deficit. Indeed, it must be confessed that we could hardly have had a more unfavorable period than the last two years for the collection of tariff revenue. We can not reasonably hope that our recuperation from this business depression will be sudden, but it has already set in, with a promise of acceleration and continuance. I believe our present tariff law, if allowed a fair opportunity, will in the near future yield a revenue which, with reasonable economy in expenditures, overcome all deficiencies. In the meantime no deficit that has occurred or may occur need excite or disturb us.

To meet any such deficit we have in the Treasury, in addition to a gold reserve of one hundred millions, a surplus of more than \$128,000,000 applicable to the payment of the expenses of the Government, and which must, unless expended for that purpose, remain a useless hoard, or, if not extravagantly wasted, must in any event be perverted from the purpose of its exaction from our people. The payment, therefore, of any deficiency in the revenue from this fund is nothing more than its proper and legitimate use.

The Government thus applying a surplus, for-

tunately in its Treasury, to the payment of expenses not met by its current revenues, is not at all to be likened to a man living beyond his income and thus incurring debt or encroaching on his principal. It is not one of the functions of our Government to accumulate and make additions to a fund not needed for immediate expenditure. With individuals it is the chief object of struggle and effort. The application of an accumulated fund by the Government to the payment of its running expenses is a duty.

An individual living beyond his income and encumbering himself with debt or drawing upon his accumulated fund of principal is either unfortunate or improvident. The distinction is between a government charged with the duty of expending for the benefit of the people and for proper purposes all the money it receives from any source and the individual who is expected to manifest a natural desire to avoid debt or to accumulate as much as possible and to live within the income derived from such accumulations, to the end that they may be increased or at least remain unimpaired for the future use and enjoyment of himself or the objects of his love and affection who may survive him.

It is immeasurably better to appropriate our surplus to the payment of justifiable expenses than to allow it to become an invitation to reckless appropriations and extravagant expenditures. I suppose it will not be denied that under the present law our people obtain the necessities of a comfortable existence at a cheaper rate than formerly. This is a matter of supreme importance, since it is the palpable duty of every just government to make the burdens of taxation as light as possible. The people should not be required to relinquish this privilege of cheap living except under the stress of their Government's necessity made plainly manifest.

This reference to the condition and prospects of our revenues, naturally suggests an allusion to the weakness and vices of our financial methods. They have been frequently pressed upon the attention of Congress in previous Executive communications and the inevitable danger of their toleration pointed out. Without now repeating these details I can not refrain from again earnestly presenting the necessity of the prompt reform of a system opposed to every rule of sound finance and shown by experience to be fraught with the gravest peril and perplexity. The terrible civil war which shook the foundations of our Government more than thirty years ago brought in its train the destruction of property, the wasting of our country's substance, and the estrangement of brethren. These are now past and forgotten. Even the distressing loss of life the conflict entailed is but a sacred memory, which fosters patriotic sentiment and keeps alive a tender regard for those who nobly died. And yet there remains with us to-day, in full strength and activity, as an incident of that tremendous struggle, a feature of its financial necessities, not only unsuited to our present circumstances, but manifestly a disturbing menace to business security and an ever-present agent of monetary distress. Because we may be enjoying a temporary relief from its depressing influence this should not lull us into a false security nor lead us to forget the suddenness of past visitations.

I am more convinced than ever that we can have no assured financial peace and safety until the Government currency obligations upon which gold may be demanded from the Treasury are withdrawn from circulation and canceled. This might be done, as has been heretofore recommended, by their exchange for long-term bonds bearing a low rate of interest, or by their redemption with the proceeds of such bonds. Even if only the United States notes known

as greenbacks were thus retired, it is probable that the Treasury notes issued in payment of silver purchases, under the act of July 14, 1890, now paid in gold when demanded, would not create much disturbance, as they might, from time to time, when reserved in the Treasury by redemption in gold or otherwise, be gradually and prudently replaced by silver coin.

This plan of issuing bonds for the purpose of redemption certainly appears to be the most effective and direct path to the needed reform. In default of this, however, it would be a step in the right direction if currency obligations redeemable in gold, whenever so redeemable, should be canceled instead of being reissued. This operation would be a strong remedy, but it would improve present conditions. National banks should redeem their own notes. They should be allowed to issue circulation to the par value of bonds deposited as security for its redemption, and the tax on their circulation should be reduced to $\frac{1}{2}$ of 1 per cent.

In considering projects for the retirement of United States notes and Treasury notes issued under the law of 1890, I am of the opinion that we have placed too much stress upon the danger of contracting the currency and have calculated too little upon the gold that would be added to our circulation if invited to us by better and safer financial methods. It is not so much a contraction of our currency that should be avoided as its unequal distribution. This might be obviated, and any fear of harmful contraction at the same time removed by allowing the organization of smaller banks in less populous communities than are now permitted, and also authorizing existing banks to establish branches in small communities under proper restrictions.

The entire case may be presented by the statement that the day of sensible and sound financial methods will not dawn upon us until our Government abandons the banking business and the accumulation of funds, and confines its monetary operations to the receipt of the money contributed by the people for its support and to the expenditure of such money for the people's benefit. Our business interests and all good citizens long for rest from feverish agitation and the inauguration by the Government of a reformed financial policy which will encourage enterprise and make certain the rewards of labor and industry.

Another topic in which our people rightfully take a deep interest may be here briefly considered. I refer to the existence of trusts and other huge aggregations of capital, the object of which is to secure the monopoly of some particular branch of trade, industry, or commerce, and to stifle wholesome competition. When these are defended, it is usually on the ground that though they increase profits they also reduce prices and thus may benefit the public. It must be remembered, however, that a reduction of prices to the people is not one of the real objects of these organizations, nor is their tendency necessarily in that direction. If it occurs in a particular case, it is only because it accords with the purposes or interests of those managing the scheme.

Such occasional results fall far short of compensating the palpable evils charged to the account of trusts and monopolies. Their tendency is to crush out individual independence and to hinder or prevent the free use of human faculties and the full development of human character. Through them the farmer, the artisan, and the small trader is in danger of dislodgment from the proud position of being his own master, watchful of all that touches his country's prosperity, in which he has an individual lot, and interested in all that affects the ad-

vantages of business of which he is a factor, to be relegated to the level of a mere appurtenance to a great machine, with little free will, with no duty but that of passive obedience, and with little hope or opportunity of rising in the scale of responsible and helpful citizenship.

To the instinctive belief that such is the inevitable trend of trusts and monopolies is due the widespread and deep-seated popular aversion in which they are held, and not the unreasonable insistence that, whatever may be their incidental economic advantages, their general effect upon personal character, prospects, and usefulness can not be otherwise than injurious.

Though Congress has attempted to deal with this matter by legislation, the laws passed for that purpose thus far have proved ineffective, not because of any lack of disposition or attempt to enforce them, but simply because the laws themselves as interpreted by the courts do not reach the difficulty. If the insufficiencies of existing laws can be remedied by further legislation it should be done. The fact must be recognized, however, that all Federal legislation on this subject may fall short of its purpose because of inherent obstacles, and also because of the complex character of our governmental system, which, while making the Federal authority supreme within its sphere, has carefully limited that sphere by metes and bounds which can not be transgressed. The decision of our highest court on this precise question renders it quite doubtful whether the evils of trusts and monopolies can be adequately treated through Federal action, unless they seek directly and purposely to include in their objects transportation or intercourse between States or between the United States and foreign countries.

It does not follow, however, that this is the limit of the remedy that may be applied. Even though it may be found that Federal authority is not broad enough to fully reach the case, there can be no doubt of the power of the several States to act effectively in the premises, and there should be no reason to doubt their willingness to judiciously exercise such power.

In concluding this communication, its last words shall be an appeal to the Congress for the most rigid economy in the expenditure of the money it holds in trust for the people. The way to perplexing extravagance is easy, but a return to frugality is difficult. When, however, it is considered that those who bear the burdens of taxation have no guarantee of honest care save in the fidelity of their public servants, the duty of all possible retrenchment is plainly manifest.

When our differences are forgotten, and our contests of political opinion are no longer remembered, nothing in the retrospect of our public service will be as fortunate and comforting as the recollection of official duty well performed and the memory of a constant devotion to the interests of our confiding fellow-countrymen.

GROVER CLEVELAND.

EXECUTIVE MANSION, Dec. 7, 1896.

Immigration.—At the first session of the Congress the House of Representatives passed a bill designed to restrict immigration. It was in the form of an amendment to the act of March 3, 1891, and it provided that all male persons between the ages of sixteen and sixty who can not both read and write the English or some other language be excluded from this country, excepting parents of persons now living here or hereafter admitted. It prohibited aliens from engaging in labor in the United States while retaining a residence abroad; it forbade employers to set such aliens to work; and it declared unlawful the entrance of any alien into this country from nations outside of America,

except at points where a board of immigrant inspection is maintained.

The measure was reported in the Senate Dec. 10, 1890, with amendments, and as it passed that body it provided that any admissible immigrant might bring with him or send after an illiterate wife, parent, grandparent, minor child, or grandchild; it arranged for a test of illiteracy by means of five-line slips from the Constitution of the United States to be read and copied by immigrants; and it exempted refugees from Cuba during the continuance of war on that island from its operation.

In the Senate Mr. Lodge, of Massachusetts, after reading resolutions from various labor organizations in favor of the measure, said:

"I will confess that I am very radical upon this question. I should be glad to see immigration stop until every man and woman seeking work in this country have employment. Women certainly work for low wages, and the lines of work for which they compete are overcrowded. I think that that which makes it desirable to exclude the male immigrant makes it just as desirable to exclude the female immigrant. The illiteracy test is simply an effort to adopt a test which shall restrict immigration, lower the number of immigrants coming to this country, and do it by shutting out the most undesirable class. That all persons who can not read and write are undesirable, no one will contend. No form of exclusion can be perfectly accurate, but it comes as near to it as any test. If Senators will take the trouble to read the very careful analysis made in the report of the committee they will, I think, find what I say on that point justified.

"This test, if it had been applied during the last year, would have shut out 75,000 immigrants, according to the last report of the Commissioner of Immigration. That is sufficient argument for me. I do not see how it can be advisable to add constantly to the volume of the unemployed in this country in that direct way. It is simply taking in the unemployed of other countries.

"The people gathered in our great cities without employment, who see a constant stream of the unemployed of other nations pouring in, know that that is one direct form of competition with them. They may differ as to other policies in other respects, as to the tariff and the currency questions, but there is no doubt that they are all united today in feeling that this unrestricted competition of the unemployed of other lands should be prevented. That it affects them, and affects them badly, no one can doubt. It is perfectly plain that if there are unemployed here and you pour in additional unemployed constantly, you add to the chance all the time that our own unemployed will remain as they are. That, to me, is the controlling reason for this legislation. That is why it makes no difference in my mind whether it be the competition with the labor of women or the competition with the labor of men. I think at this period we ought to do something to check it."

Mr. Palmer, of Illinois, objected to the measure on the ground that it might result in the separation of families, and then added:

"I believe in the right of expatriation. I believe in the right of emigration. I believe that this world was made by the Almighty, and that these attempts at controlling the movements of good people are wrong. I admit the right of any Government to exclude from its borders persons of bad character, persons addicted to crime, dangerous persons of all classes, but I want to say that I have no idea in the world that the class of persons whom it is really desirable to exclude from the country will be affected by this bill. I understand the dan-

gerous classes more generally read and write than the classes which are not so dangerous. I claim, however, the right of any person of good character and industrious habits to come into the United States at his pleasure, and bring with him his wife and children. I believe in that right. While I would consent to any other limitation aside from that of good character and industrious habits, still I would not consent to the separation of families which this bill would necessarily produce."

Mr. Chandler, of New Hampshire, argued that the bill would not prevent the immigration of those earnestly bent upon that course, but simply delay it:

"I wish the attention of the Senator from Illinois a moment in order that I may ask him whether the trouble which he has stated is not entirely obviated by the suggestion which I made the other day, that it will require only a few months' delay on the part of the father and mother in coming here with children to enable them to instruct their children how to read and write either the English language or their native language? Does the Senator realize that this bill is no hardship upon his own statement of the case, because it can only exclude the children of this father and mother and delay them for a period of time sufficient to enable them to educate those children? Take the case of a father and mother, say forty years of age. The law requires that that father and mother shall read and write, and the Senator does not propose to change that requirement. Now, here is a father and mother who can read and write, the parents of a family in Italy or in England. They want to come to this country. They have children between the ages of sixteen and twenty-one who can not read or write. They ought to have had their children taught to read and write, but they find that when they desire to come to this country they have not so taught them. Now, I ask the Senator if it is a hardship which would make him wish to amend this bill simply to say to that father and mother: 'You can read and write; and now before coming to America you wait until your children can read and write your own language.'

"This is a mild bill; it is a weak bill, in the opinion of many of us, because it does not go far enough. It does nothing in the world but detain abroad in their own countries for a sufficient length of time the persons who want to come here so that they may obtain the simplest rudiments of education, to wit, the reading and writing of their own language.

"Mr. President, this bill has been purposely made mild in order that it may receive the support of members of all political parties, and with the hope that it would go through the Senate without any objection from any quarter, in accordance with the pledges of both the great political parties of the country."

Mr. Mills, of Texas, declared against the measure on grounds of principle and policy.

"We have a great body of foreign people in this country who are good citizens. They are laborers; they have helped to build up this great hive of American industry, and there is room for more of them in the United States. Speaking for my own State, I would be glad to welcome 100,000 Germans to come to Texas; I would be glad to welcome 100,000 Irishmen; I would be glad to welcome 100,000 Scandinavians. There is a large number of these three races of foreigners living in the State of Texas. I have known many of them, and known them for many years, and I know them to be good citizens. Suppose that the people from some of these foreign countries wish to come and bring their children and they have not had the opportunity to have

them educated under the despotic governments of Europe, they are to be kept away and to wait until they can educate their children, and the Government can make no provision for them. This is a free country. We have hitherto invited them to come and enjoy the blessings of liberty with ourselves, and now we say: 'Because your government is a despotic government and has enslaved you and your children and it is impossible for you ever to educate them, you shall be proscribed from coming to this country and enjoying the blessings of free government.'

"This is the only really free country in the world. It is a peculiar Government among the governments and nationalities of the world. This continent was dedicated to liberty when this Government was erected, to be the home of a free people, of a self-governing people, of a people who held their liberties in their own hands; and now we are told that the civil service must apply to the immigration of people coming from foreign countries, and a man or his children who can not stand the test of a civil-service examination must be remanded back to despotism again because they have lived in a despotic government which cared not for them.

"No, Mr. President, I am opposed to the educational test. The capacity to read and write is no evidence of virtue either in manhood or womanhood, and I have not a doubt but that the penitentiaries of every State in the Union are full of criminals who can read and write, and read and write well. I have not a doubt that the majority of the wretches whose necks have been broken on the gallows could read and write. The acquirement of the capacity to read and write does not dispel vice and wickedness from the heart. There are thousands and hundreds of thousands of good people in this country and in other countries who can not read and write. I doubt very much if one in ten of the men or women who first came to this country could read and write; but yet see what a precious heritage they have created in this country and bequeathed to us.

"These, sir, are the reasons which constrain me to vote against this bill, and to preserve and persevere and continue in the policy of our fathers to keep the test of pauperism and crime the only test to be applied to foreigners coming to enjoy this heritage of liberty with us."

The bill passed the Senate Dec. 17 by the following vote:

YEAS—Allen, Bacon, Baker, Bate, Berry, Brown, Burrows, Butler, Call, Cameron, Cannon, Chandler, Chilton, Clark, Davis, Dubois, Elkins, Faulkner, Frye, Gallinger, Hale, Hansbrough, Harris, Hawley, Hill, Hunt, Kyle, Lodge, McBride, McMillan, Mantle, Martin, Mitchell of Oregon, Morrill, Nelson, Pasco, Peffer, Perkins, Pettigrew, Platt, Proctor, Pugh, Quay, Sewell, Sherman, Smith, Stewart, Teller, Vest, Walbridge, Wetmore, Wilson—52.

NAYS—Blackburn, Blanchard, Caffery, Lindsay, Mills, Mitchell of Wisconsin, Morgan, Murphy, Palmer, Vicks—10.

NOT VOTING—Aldrich, Allison, Brice, Carter, Cockrell, Culison, Daniel, Gear, George, Gibson, Gordon, Gorman, Gray, Irby, Jones of Arkansas, Jones of Nevada, Pritchard, Roach, Shoup, Squire, Thurston, Tullman, Turpin, Voorhees, Warren, White, Wolcott—27.

The House disagreed to the Senate amendments and a conference committee was appointed. That committee made a report which was concurred in by the House and nonconcurring in by the Senate.

The points of objection in the conference report were stated by Mr. Gibson, of Maryland, as follows:

"The result of that conference is as I have stated in my point of order, that the conferees instead of

determining the differences between the Senate bill and the House bill, reporting that they had agreed and reporting the sections agreed upon, or reporting that the House had adhered and the Senate had receded or that the Senate had adhered and the House had receded, and presenting the result of that conference in the shape of a perfected bill which had before that time been passed upon by both houses, have not done so; but, on the contrary, they sought—I speak it reverently—to accomplish by indirection what the Senate of the United States and the House of Representatives had expressly determined against.

"I now come to the points of difference to which the Senator from Massachusetts has called my attention. The conference report presents a very different immigration bill from that passed upon by the Senate and passed upon by the House of Representatives. Let us see whether I am correct or whether I am incorrect in that statement.

"In the very first section of the conference report—and here is the suggestion I made—the conferees have added to what had already been agreed upon by both houses. The Senate and the House had agreed upon the age limit; the Senate and the House had agreed as to the character of the reading and writing test; the Senate and the House had agreed that all persons over sixteen years of age who can not read and write the language of their native country or some other language, except in the case of aged persons not able to read and write at all—a grandparent—should be admitted. The House had agreed that all male persons between sixteen and sixty years of age who can not both read and write the English language or some other language should be excluded. The House and the Senate practically agreed to these conditions in this connection; yet we find the conferees in their wisdom, in the plenitude of the authority which it seems that they have arrogated to themselves or not—which remains to be seen—have added to and have changed what the House of Representatives and the Senate have suggested without the House and the Senate having passed upon that question. They have provided that:

"All persons physically capable and over sixteen years of age who can not read and write the English language or the language of their native or resident country."

"Here is a provision to which I call the attention of the Senator from Massachusetts in answer to his inquiry made of me a moment since as to where a change has been made by the conferees.

"The object of the immigration bill as passed by the Senate and as passed by the House of Representatives was to admit immigrants who could conform to the educational test. The conferees have gone outside of the authority with which they were invested by their respective houses and have added what the House and the Senate never before passed upon, and that is the prohibition entirely and absolutely of a class of immigrants who would have been admitted under the Senate bill and under the House bill. The explanation of that is to be found in the fact that there are thousands of immigrants eligible under the House bill and under the Senate bill who are ineligible under the conference report because of the fact that they have not a resident country and can not speak the language of their native country. Those are Russian Jews, the Slavs, the Hungarians, Mennonites, and thousands more of the different classes of immigrants that I might mention who are intended to be admitted under the bill passed by both houses who are excluded by the conference report. I hope that point is clear, Mr. President.

"I come to the other provisions where the con-

forces further transcended their authority. Under the bill substituted by the Senate for the House bill there was a provision that a man who could pass the illiteracy test should be permitted to send for his wife if he had left her behind, or if she had accompanied him and was illiterate herself, that she was admissible if he was; and yet, transcending the plain proposition on the part of the Senate and on the part of the House of Representatives, the conferees in their report have added to what the House of Representatives and the Senate had agreed upon by undertaking to separate man and wife and to commend the alien immigrant to the society of his grandfather rather than to that of his wife. They have excluded the wife and admitted the grandfather. The House of Representatives and the Senate passed no such bill, and yet the conferees, seeking by indirection, as I charge here, rather than by express legislation, have altered it by adding to what has been agreed upon by both houses.

"I come to the second proposition, as to the further point of order which I make in this connection, and that is that they more arrogantly—and I do not use the word reverently either in this connection—have sought to do by indirection what has never been undertaken by either house of Congress, and that was to add new sections to a bill."

Mr. Lodge, of Massachusetts, though not conceding the fairness of the criticism, proposed a new conference committee.

In the House, Mr. Danford, of Ohio, after explaining the scope of the changes made by the conference committee, said:

"Now as to the number of illiterates seeking our shores from year to year. I have before me the report of the Commissioner General of Immigration for the year ending June 30, 1896. You will find on page 30 of the report that the number of illiterates who reached this country during that fiscal year was 66,314 out of a total of 263,709. Of this illiteracy a very large proportion came from southern and eastern Europe. The percentage of illiteracy from the Scandinavian states was exceedingly small, less than 1 per cent.; from Denmark it was but 0.93, from Norway 1.18, from Sweden 1.16, from Germany less than 3 per cent., from England about 5 per cent., and Ireland only 7 per cent. But when you come to the countries of eastern and southern Europe the percentage runs up to over 60 of illiterates, so that the immigration that comes to us from Germany and from the Scandinavian states and the countries of western and northern Europe will be affected very little by the passage of the act."

In defense of Italian immigrants, Mr. Buck, of Pennsylvania, said:

"We are told secretly—it is not openly declared as the intention of the bill to strike in that direction—that numbers of an insignificant and inferior race come here from southern Europe. I need not defend that race. It is true that under the effects of oppression and peculiar institutions the mass of those people are ignorant, but remember they are the descendants of the Caesars and the Gracchi. Remember that Venice was the mistress of the world when London was but the "tower of a prison" and a slaughter field of political strife and murders. Remember that when all of northern Europe was in the darkness of the Middle Ages Italy had her Dante and her Tasso, her Petrarch, her Boccaccio, her Michael Angelo, and a little later her Christopher Columbus. These names have the instinct of high aspiration in their souls."

Mr. Walker, of Massachusetts, attacked the whole measure as narrow and reactionary:

"Mr. Speaker, I confess that this conference report, as it now stands, has stirred my blood more

than anything I can remember since I have been a member of Congress. Can it be possible that we are forgetting the principles that we have stood for in the past? Can it be possible that we are forgetting to-day that we are a Christian nation? Can it be that we are forgetting that all that constitutes true manliness is the willingness of a man to sacrifice something of himself for others? Can it be possible that this bad measure is to be urged through the House on the plea that this measure must be adopted or a good measure can not be had?

"I confess I shrink with extreme reluctance from adding any other prohibition to those already raised to impede immigration to this country. Have we forgotten so soon the motives and principles that moved our fathers or our grandfathers when they first came here? I tell you, sir, that we are none of us so far removed from the immigrant that we can lightly touch him by the smallest weight of our little finger or lay the burden of a hair upon him that we can possibly avoid in justice to ourselves. When we do restrict immigration, it should be done with the very greatest possible care."

"Is the educational qualification the only one? Why, Mr. Speaker, the very worst class of immigrants that now come here can not only read and write, but they are, some of them, from the most highly educated classes. Such people are found in the ranks of the socialists, the communists, the anarchists, and the nihilists. They may come, and we have no means of excluding them. We have no law for their exclusion. Is it not better for our own interests and the interests of the foreign born who have already made their homes among us that the better class of honest toilers from these foreign countries should come here to balance their baneful influences? Is it not true that in the last election it was among these people—in our foreign-born population—we found the most conservative of our people? I say, sir, that the most conservative people during the last campaign and election were found in the immigrants who have made their homes among us. Almost to a man they were found honest, faithful to our institutions, and conservative."

"The House bill was sufficiently drastic; but let us look for a moment at the condition of this bill as it is returned to us by the conference committee. Mr. Speaker, I would sooner burn off my right hand than cast a vote for the bill in its present condition or if it is not amended in several particulars."

The general argument for the bill was put by Mr. Taylor, of Ohio, as follows:

"It is the philosophy of protection which lies behind and justifies this bill. It is the law of self-preservation that demands it. It is quite as necessary that we should protect ourselves against cheap labor as that we should protect ourselves against the product of cheap labor. It is just as important that we should defend our civilization against the ravaging inroads of other civilizations when those ravages come through the immigration of cheap labor as when they come through the product of that labor."

"The civilizing process, so far as it relates to the products of cheaper labor, comes through protective-tariff acts. We can not civilize the goods themselves, but we can prevent their invasion of civilization; that is to say, we can prevent their lowering the rewards which the American citizen receives for his labor. It is the purchasing power of this reward which fixes the character and quality of our civilization."

"The civilizing process, so far as it relates to the importation of the cheap labor, comes through laws restricting immigration. Now can these laws so

spectate as to minimize the deteriorating effects of immigrant immigration?

Answered from one standpoint, two classes of people have come to this country from other shores. One is made up of peoples who, when they mingle with the American people, become Americans; of those who freely and naturally commingle with our people and our ways; who raise themselves to the American standard; who love the American flag; who become all that the American people are. In a few years they are welded to the old stock, leaving impressions and taking impressions, and producing a generally homogeneous result.

"The other class possesses no inherent capacity to assimilate. They do not, except in rare and noticeable instances, become absorbed into the tissue of our own people. Their fiber never changes. Though among us and apparently of us, they are aliens in spirit, in tradition, and, generally, in language.

"Such a people, in the broadest and most patriotic sense, can never be said to be desirable elements in our social fabric.

"If what I have said be true and be understood, I need not waste words of eulogy on those splendid people who, though of foreign birth, have helped to make our country what it is and who share with us a just pride in the magnificent empire which they have helped to make magnificent. They are less Americans than I take them to be if they oppose the spirit of this measure.

"The disturbing, the threatening fact is that the character of our immigration has radically changed in the last twenty-five years. From some countries we have received a brave, stalwart, and desirable people; from others we have received an increasing horde whose influence is, and has been, distinctly deteriorating and demoralizing. It is against the latter that we would rouse the spirit of patriotism, and, if that will not suffice, we appeal to a spirit of self-interest.

"The proof is at hand. By the census of 1890 we learn that out of every million of native-born white inhabitants of the United States 898 were inmates of prisons; out of every million of foreign-born whites 1,768 were inmates of prisons.

"Out of every million of native-born whites, 829 were paupers in almshouses; out of every million of foreign-born whites, 3,131 were paupers in almshouses.

"To put it in another form, in proportion to the population there are twice as many foreign-born white prisoners as native born. There are nearly four times as many foreign-born white paupers as native born.

"Comment is unnecessary, if not misleading. No eloquence could paint in more vivid words the appalling facts which these figures present.

"Let us now examine another item of proof more convincing, perhaps, than that just adduced.

"During the year ending June 30, 1896, the number of immigrants landed at ports of the United States was 343,267. These brought with them money amounting to \$4,917,318, or \$14.30 each. How long did that sum suffice to support these new additions to our idle millions? How long was it until these poor people became a public charge or took the bread out of the mouth of some American workman or workwoman by underbidding for his or her job? Is it for any such purpose that our gates are thrown open and the teeming masses of other lands invited to come in? Have those who are here no rights that we are bound to respect? Every man who was born under or has adopted our flag has an equal right with every other, but I submit that he has a greater, an infinitely greater, right than those who are yet in the homes of their

fathers across the water. Unhappy the country and distressed the people which do not recognize and assert that right.

"In the same connection we learn that, while the average amount brought by the German immigrant was \$30, the Russian brought \$6.75, the Italian \$8.50, and the Austro-Hungarian \$11.70. No man can contemplate these unhappy people without pity; but his pity is more bountiful and effective if expressed before its unhappy object has left his home in another country.

"From June 30, 1885, to June 30, 1896, the number of immigrants landed at our ports was 4,604,120, and of this amazing number approximately 2,500,000 were males above the age of fifteen.

"The prosperity of this country has been threatened, and adversity has been and is upon us. Many causes have conspired to produce this result. Has the introduction of 2,500,000 able-bodied workmen affected it any? Doubtless we can absorb many thousands of immigrants every year, but we do not want to absorb any that we can not assimilate.

"Forty per cent., I think, of the immigration of the last ten years has been distinctly undesirable. It has demoralized the social conditions in many sections of the country. It has demoralized labor and wages wherever it has gone. If there is work for him to do, the immigrant who is ready to come up to the American standard of living is a gain to the community to which he comes. The immigrant who will not raise himself to our standard is a menace to our civilization, no matter how much work there may be for him to do. He has no proper place among us.

"These ought to be self-evident facts; yet we find them disputed. I protest that America is not an asylum. We want all to come for whom we have work and who can understand us and become a part of us; but we do not want and do not welcome any others. Let no man mistake the temper of the American people on this point.

"But let us see now if this educational test is calculated to mitigate the evil from which we suffer and from which, if relief does not soon come, we must suffer more.

"While intelligence is not the criterion of virtue, it yet furnishes, along broad lines, a reasonably safe test. We do not need to look about us to find our proof. It is not to individual instances that we need to point. Indeed, it is not to any general law or to any generally accepted idea of the value of intelligence that we need to look. Considered in relation to its application to this subject of immigration, we have only to look to the statistics of immigration for the past year."

A second conference committee was appointed, and both House and Senate concurred in its report.

In the House, action was taken Feb. 9, 1897, after a few brief protests, among them the warning of Mr. Mahany, of New York:

"The House adopted the preceding conference report (which was afterward nonconcurring in by the Senate) notwithstanding the fact that the report, as submitted, tore asunder families, separated husbands and wives, parents and children. And now we find that this measure, which involves a sweeping change in the immigration laws of the United States, is to be rushed through this House under a motion for the previous question, which chokes off adequate debate and prevents the opponents of this legislation from pointing out in detail its manifold faults and absurdities.

"The bill as now framed fulfills practically none of the conditions for which its framers profess to have labored. With a single exception it does not exclude any one whom the great body of American citizens desire to exclude. There is unquestionably

a sentiment in this country in favor of better and closer safeguards in the administration of our immigration laws, and though American labor is interested in this question, it is not interested in this bill. The vast majority of American wage earners are liberal, broad-minded, sympathetic men, and they have no desire to close the doors against those who come from Old World oppression with clean mind and healthy body and sturdy patriotism to cast in their lot with this new republic of the West. Those whom it is the universal sentiment to exclude are the paupers, imbeciles, criminals, and other off-scourings of Europe, together with alien-contract laborers, and the 'birds of passage,' who, retaining domicile and citizenship in other lands, fatten on the substance of our own.

"But whom does this law exclude? Under its provisions every anarchist, every communist, every socialist who comes here to war upon established social order, has triumphant entry. The very fact that these men are anarchists and communists and socialists indicates that they have thought; and, to a certain degree, have been educated up to their thought. There is not one of them who could not pass the requirements of this bill. The measure strikes simply at those people who, under the oppressive laws of Old World governments, are—no matter what their aspirations—absolutely unable to obtain, nay, are debarred by iron social conditions from obtaining, the necessary education to meet the test of this bill. It shuts out honest, God-fearing, virtuous people, whose descendants would make patriotic citizens and strong pillars of this republic. It is a crime against civilization. It is a bar against the educational advancement of the world.

"Why, Mr. Speaker, the absurdity of the proposition is manifest. The members of this House who, by an overwhelming majority, will, in all probability, pass this bill, would—and I say it with due deliberation—the great majority, I repeat, of the men now occupying seats in this Chamber would not only not be Representatives on this floor, but would not even be citizens of the United States if this bill had been in operation a hundred or a hundred and fifty years ago.

"What we want is not restriction of immigration so much as the regulation of it that shall take these voyagers from foreign shores away from the crowded cities of the Union and place them where they can win prosperity for themselves and add to the glory and progress of the great republic.

"And I desire to say to the members of the Republican party here that it was the foreign-born vote in the last election that gave you your great majorities in the States of the West and the commonwealths of the East. In the spirit of nonpartisanship that should characterize this discussion, I compliment the Democratic party, which, with all its faults, has rarely used its victories for the purpose of proscription or oppression. I wish to say to you, members of this House—and while it may be the voice of youth and inexperience, it may eventually prove to be the voice of prophecy—that if you enact this legislation every man who votes for its passage will in the future find that, like Banquo's ghost, that vote will never down.

"As a member of this committee, I warn Republicans especially, that in the plenitude of our victory we should use our power wisely, not illiberally; that we should so administer this vote of confidence that both the future of the United States and the civilization of the world shall be benefited thereby. Let me tell you also not to mistake the meaning of the last election. I am not unconscious of the fact that many of my Republican brethren are prone to consider that triumph, not as a repudiation (as it

was) of unsound finance, but as an indorsement of plutocracy, as an indorsement of monopoly, as an indorsement of everything that distracts the conscience and the common sense of the plain people.

"I feel deeply on this subject. I believe I understand the sensibilities of the foreign-born voters in the United States. This bill is a blow at the Polish immigration, which has as much right to the fruits of liberty as any other nation upon the face of the earth. It is an indirect reflection upon the German element, which gave us to a very large extent our splendid majorities in the last election. I will not speak of the particular nation from which my forefathers came, for fear I may be considered as animated in this address by individual prejudice. But I warn you, my friends, that if you enact this measure you will have reason hereafter to remember these words—that on the ruins of your theories and upon the destruction of your party victories a more liberal policy will march to success."

The vote in the House on concurrence was as follows:

YEAS—Acheson, Adams, Aitken, Aldrich of Illinois, Allen of Mississippi, Anderson, Avery, Babcock, Bailey, Baker of Maryland, Baker of New Hampshire, Barney, Bartholdt, Bell of Colorado, Bennett, Bingham, Bishop, Black, Blue, Bontrner, Bowers, Brewster, Broderick, Brownell, Brosius, Brown, Bull, Burrell, Burton of Missouri, Burton of Ohio, Cannon, Chickering, Clardy, Clark of Iowa, Cobb, Coffin, Cooke of Illinois, Cooper of Florida, Cooper of Texas, Cooper of Wisconsin, Corlies, Cousins, Crisp, Crowther, Crump, Curtis of Iowa, Curtis of Kansas, Curtis of New York, Dalzell, Danford, Dayton, De Armond, Denny, De Witt, Dinsmore, Dockery, Dolliver, Dovener, Draper, Ellett, Ellis, Erdman, Fairchild, Fenton, Foote, Foss, Fowler, Gamble, Gardner, Gibson, Gillett of Massachusetts, Graff, Griffin, Grosvenor, Grout, Grow, Hager, Hall, Halterman, Hanly, Hart, Hartman, Hatch, Heatwole, Hemenway, Henderson, Henry of Connecticut, Henry of Indiana, Hepburn, Hermann, Hicks, Hilborn, Hill, Hitt, Hocker, Hopkins, Howe, Howell, Hubbard, Huff, Hulick, Huling, Hull, Jenkins, Johnson of California, Johnson of Indiana, Johnson of North Dakota, Joy, Kerr, Kirkpatrick, Knox, Lacey, Latimer, Layton, Lefever, Leonard, Lewis, Linney, Linton, Little, Loudenslager, Low, Mahon, Marsh, McCall of Massachusetts, McCall of Tennessee, McCleary of Minnesota, McClellan, McClure, McCulloch, McDearmon, McLachlan, McRae, Meiklejohn, Mercer, Meredith, Miles, Miller of Kansas, Miller of West Virginia, Milliken, Milnes, Minor of Wisconsin, Mitchell, Moody, Morse, Neill, Northway, Ogden, Otjen, Overstreet, Parker, Patterson, Pearson, Perkins, Phillips, Pitney, Poole, Powers, Prince, Pugh, Quigg, Ray, Reeves, Rinaker, Royce, Scranton, Settle, Shafroth, Sherman, Shuford, Simpkins, Smith of Illinois, Smith of Michigan, Snover, Sorg, Southard, Spalding, Sperry, Stahl, Steele, Stewart of New Jersey, Stewart of Wisconsin, Stokes, W. A. Stone, Strong, Stroud of North Carolina, Sulloway, Sulzer, Talbert, Tate, Tawney, Taylor, Terry, Thomas, Towne, Tracewell, Tracey, Treloar, Turner of Virginia, Tyler, Van Horn, Van Voorhis, Wadsworth, Walker of Virginia, Warner, Watson of Indiana, Wheeler, White, Wilber, Williams, Wilson of Idaho, Wilson of Ohio, Wilson of South Carolina, Wood, Woodman, Wooster, Wright—217.

NAYS—Bartlett of Georgia, Bell of Texas, Betty, Buck, Calderhead, Catchings, Clarke of Alabama, Cockrell, Cox, Culberson, Cummings, Harrison, Hendrick, Hurley, Kiefer, Kleberg, Lawson, Long, Loud, Maguire, Mahany, McLaurin, Meyer, Money, Murray, Noonan, Otey, Owens, Pendleton, Richard-

son, Robertson of Louisiana, Sauerhering, Sayers, Sparkman, Stallings, Strait—36.

Not voting—Abbott, T. H. Aldrich, W. F. Aldrich, Allen of Utah, Andrews, Apsley, Arnold of Pennsylvania, Arnold of Rhode Island, Atwood, Baker of Kansas, Bankhead, Barham, Barrett, Bartlett of New York, Beach, Belknap, Boutelle, Brumm, Clark of Missouri, Coddling, Colson, Connally, Cook of Wisconsin, Cowen, Crowley, Daniels, Dingley, Doolittle, Eddy, Evans, Faris, Fischer, Fitzgerald, Fletcher, Gillet of New York, Goodwyn, Griswold, Hadley, Hainer of Nebraska, Harby, Harmer, Harris, Heimer of Pennsylvania, Howard, Hunter, Hutcheson, Hyde, Jones, Kem, Kendall, Kulp, Kyle, Loughly, Leisouring, Lester, Livingston, Lorimer, Madlox, Martin, McCormick, McCreary of Kentucky, McEwan, McMillin, Miner of New York, Mondell, Moses, Mozley, Murphy, Newlands, Odell, Payne, Pickler, Price, Rancy, Reyburn, Robinson of Pennsylvania, Rusk, Russell of Connecticut, Russell of Georgia, Shannon, Shaw, Skinner, Southwick, Spencer, Stephenson, C. W. Stone, Strode of Nebraska, Swanson, Taft, Thorp, Tucker, Turner of Georgia, Updegraff, Walker of Massachusetts, Wanger, Washington, Watson of Ohio, Wellington, Willis, Wilson of New York, Woodard, Yoakum—102.

In the Senate there was renewed discussion of the measure, and the vote on the concurrence in the conference report, Feb. 17, was as follows:

YEAS—Aldrich, Allison, Baker, Brown, Burrows, Butler, Chandler, Chilton, Cullom, Davis, Elkins, Faulkner, Frye, Gallinger, Gear, Hill, Hoar, Lodge, McBride, Martin, Morrill, Nelson, Peffer, Perkins, Pettigrew, Platt, Pritchard, Proctor, Quay, Sewell, Sherman, Teller, Thurston, Wetmore—34.

NAYS—Bacon, Bate, Berry, Blanchard, Caffery, Call, Carter, Cockrell, Gibson, Gorman, Gray, Hansbrough, Hawley, Lindsay, Mantle, Mills, Mitchell of Wisconsin, Morgan, Murphy, Palmer, Pasco, Pugh, Roach, Shoup, Stewart, Tillman, Turpie, Vest, Vilas, Voorhees, White—31.

Not voting—Allen, Blackburn, Brice, Cameron, Cannon, Clark, Daniel, Dubois, George, Gordon, Hale, Harris, Irby, Jones of Arkansas, Jones of Nevada, Kenney, Kyle, McMillan, Mitchell of Oregon, Smith, Squire, Walthall, Warren, Wilson, Wolcott—25.

The measure as finally adopted was as follows:

"Be it enacted, etc., That section 1 of the act of March 3, 1891, in amendment of the immigration and contract-labor acts, be, and hereby is, amended by adding to the classes of aliens thereby excluded from admission to the United States the following: All persons physically capable and over sixteen years of age who can not read and write the English language or some other language; but a person not so able to read and write who is over fifty years of age and is the parent or grandparent of a qualified immigrant over twenty-one years of age and capable of supporting such parent or grandparent may accompany such immigrant, or such a parent or grandparent may be sent for and come to join the family of a child or grandchild over twenty-one years of age, similarly qualified and capable, and a wife or minor child not so able to read and write may accompany or be sent for and come to join the husband or parent similarly qualified and capable.

"Sec. 2. For the purpose of testing the ability of the immigrant to read and write, as required by the foregoing section, the inspection officers shall be furnished with copies of the Constitution of the United States, printed on numbered uniform pasteboard slips, each containing not less than 20 nor more than 25 words of said Constitution printed in the various languages of the immigrants in double small pica type. These slips shall be kept in boxes made for that purpose and so constructed as to con-

ceal the slips from view, each box to contain slips of but one language, and the immigrant may designate the language in which he prefers the test shall be made. Each immigrant shall be required to draw one of said slips from the box and read, and afterward write out, in full view of the immigration officers, the words printed thereon. Each slip shall be returned to the box immediately after the test is finished, and the contents of the box shall be shaken up by an inspection officer before another drawing is made. No immigrant failing to read and write out the slip thus drawn by him shall be admitted, but he shall be returned to the country from which he came at the expense of the steamship or railroad company which brought him, as now provided by law. The inspection officers shall keep in each box at all times a full number of said printed pasteboard slips, and in the case of each excluded immigrant shall keep a certified memorandum of the number of the slip which the said immigrant failed to read or copy out in writing. If in any case from any unavoidable cause the foregoing slips are not at hand for use, the inspection officers shall carefully and thoroughly test the ability of the immigrant to read and write, using the most appropriate and available means at their command; and shall state fully in writing the reasons why the slips are lacking, and describe the substituted method adopted for testing the ability of the immigrant.

"SEC. 3. That the provisions of the act of March 3, 1893, to facilitate the enforcement of the immigration and contract-labor laws, shall apply to the persons mentioned in section 1 of this act.

"SEC. 4. That it shall hereafter be unlawful for any male alien who has not in good faith made his declaration before the proper court of his intention to become a citizen of the United States to be employed on any public works of the United States, or to come regularly or habitually into the United States by land or water for the purpose of engaging in any mechanical trade or manual labor for wages or salary, returning from time to time to a foreign country.

"SEC. 5. That it shall be unlawful for any person, partnership, company, or corporation knowingly to employ any alien coming into the United States in violation of the next preceding section of this act: *Provided,* That the provisions of this act shall not apply to the employment of sailors, deck hands, or other employees of vessels, or railroad train hands, such as conductors, engineers, brakemen, firemen, or baggagemen, whose duties require them to pass over the frontier to reach the termini of their runs, or to boatmen or guides on the lakes and rivers on the northern border of the United States.

"SEC. 6. That any violation of the provisions of sections 4 and 5 of this act by any alien or citizen shall be deemed a misdemeanor, punishable by a fine not exceeding \$500 or by imprisonment for the term of not exceeding one year, or by both such fine and imprisonment, in the discretion of the court: *Provided,* That all persons convicted of a violation of section 4 of this act shall be deported to the country whence they came.

"SEC. 7. That notwithstanding the provisions of this or any other existing law, the Secretary of the Treasury may permit aliens to enter this country for the purpose of teaching new arts or industries under such rules and regulations as he may provide.

"SEC. 8. That this act shall not apply to persons arriving in the United States from any port or place in the island of Cuba, during the continuance of the present disorders there, who have heretofore been inhabitants of that island.

"SEC. 9. That this act shall take effect July 1, 1897."

March 2 the President sent to the House of Representatives the following veto message:
To the House of Representatives:

I herewith return without approval House bill numbered 7864, entitled "An Act to amend the immigration laws of the United States."

By the first section of this bill it is proposed to amend section 1 of the act of March 3, 1891, relating to immigration "by adding to the classes of aliens thereby excluded from admission to the United States the following: All persons physically capable and over sixteen years of age who can not read and write the English language or some other language; but a person not so able to read and write who is over fifty years of age and is the parent or grandparent of a qualified immigrant over twenty-one years of age and capable of supporting such parent or grandparent may accompany such immigrant, or such a parent or grandparent may be sent for and come to join the family of a child or grandchild over twenty-one years of age, similarly qualified and capable, and a wife or minor child not so able to read and write may accompany or be sent for and come and join the husband or parent similarly qualified and capable."

A radical departure from our national policy relating to immigration is here presented. Heretofore we have welcomed all who came to us from other lands, except those whose moral or physical condition or history threatened danger to our national welfare and safety. Relying upon the zealous watchfulness of our people to prevent injury to our political and social fabric, we have encouraged those coming from foreign countries to cast their lot with us and join in the development of our vast domain, securing in return a share in the blessings of American citizenship.

A century's stupendous growth, largely due to the assimilation and thrift of millions of sturdy and patriotic adopted citizens, attests the success of this generous and free-handed policy which, while guarding the people's interests, exacts from our immigrants only physical and moral soundness and a willingness and ability to work.

A contemplation of the grand results of this policy can not fail to arouse a sentiment in its defense, for however it might have been regarded as an original proposition and viewed as an experiment, its accomplishments are such that if it is to be uprooted at this late day its disadvantages should be plainly apparent and the substitute adopted should be just and adequate, free from uncertainties and guarded against difficult or oppressive administration.

It is not claimed, I believe, that the time has come for the further restriction of immigration on the ground that an excess of population overcrows our land.

It is said, however, that the quality of recent immigration is undesirable. The time is quite within recent memory when the same thing was said of immigrants who with their descendants are now numbered among our best citizens.

It is said that too many immigrants settle in our cities, thus dangerously increasing their idle and vicious population. This is certainly a disadvantage. It can not be shown, however, that it affects all our cities nor that it is permanent; nor does it appear that this condition where it exists demands as its remedy the reversal of our present immigration policy.

The claim is also made that the influx of foreign laborers deprives of the opportunity to work those who are better entitled than they to the privilege of earning their livelihood by daily toil. An unfortunate condition is certainly presented when any who are willing to labor are unemployed. But so

far as this condition now exists among our people, it must be conceded to be a result of phenomenal business depression and the stagnation of all enterprises in which labor is a factor. With the advent of settled and wholesome financial and economic governmental policies and consequent encouragement to the activity of capital, the misfortunes of unemployed labor should, to a great extent at least, be remedied. If it continues its natural consequences must be to check the further immigration to our cities of foreign laborers and to deplete the ranks of those already there. In the meantime those most willing and best entitled ought to be able to secure the advantages of such work as there is to do.

It is proposed by the bill under consideration to meet the alleged difficulties of the situation by establishing an educational test, by which the right of a foreigner to make his home with us shall be determined. Its general scheme is to prohibit from admission to our country all immigrants "physically capable and over sixteen years of age who can not read and write the English language or some other language"; and it is provided that this test shall be applied by requiring immigrants seeking admission to read and afterward to write not less than 20 nor more than 25 words of the Constitution of the United States in some language, and that any immigrant failing in this shall not be admitted, but shall be returned to the country from whence he came at the expense of the steamship or railroad company which brought him.

The best reason that could be given for this radical restriction of immigration is the necessity of protecting our population against degeneration and saving our national peace and quiet from imported turbulence and disorder.

I can not believe that we would be protected against these evils by limiting immigration to those who can read and write in any language 25 words of our Constitution. In my opinion it is infinitely more safe to admit a hundred thousand immigrants who, though unable to read and write, seek among us only a home and opportunity to work, than to admit one of those unruly agitators and enemies of governmental control, who can not only read and write, but delight in arousing by inflammatory speech the illiterate and peacefully inclined to discontent and tumult. Violence and disorder do not originate with illiterate laborers. They are rather the victims of the educated agitator. The ability to read and write, as required in this bill, in and of itself affords, in my opinion, a misleading test of contented industry and supplies unsatisfactory evidence of desirable citizenship or a proper apprehension of the benefits of our institutions. If any particular element of our illiterate immigration is to be feared for other causes than illiteracy, these causes should be dealt with directly, instead of making illiteracy the pretext for exclusion to the detriment of other illiterate immigrants against whom the real cause of complaint can not be alleged.

The provisions intended to rid that part of the proposed legislation already referred to from obvious hardship appears to me to be indefinite and inadequate.

A parent, grandparent, wife, or minor child of a qualified immigrant, though unable to read and write, may accompany the immigrant or be sent for to join his family, provided the immigrant is capable of supporting such relative. These exceptions to the general rule of exclusion contained in the bill were made to prevent the separation of families, and yet neither brothers nor sisters are provided for. In order that relatives who are provided for may be reunited, those still in foreign

lands must be sent for to join the immigrant here. What formality is necessary to constitute this prerequisite, and how are the facts of relationship and that the relative is sent for to be established? Are the illiterate relatives of immigrants who have come here under prior laws entitled to the advantage of these exceptions? A husband who can read and write and who determines to abandon his illiterate wife abroad will find here under this law an absolutely safe retreat. The illiterate relatives mentioned must not only be sent for, but such immigrant must be capable of supporting them when they arrive. This requirement proceeds upon the assumption that the foreign relatives coming here are in every case by reason of poverty liable to become a public charge unless the immigrant is capable of their support. The contrary is very often true. And yet, if unable to read and write, though quite able and willing to support themselves and their relatives here besides, they could not be admitted under the provisions of this bill if the immigrant was impoverished, though the aid of his fortunate but illiterate relative might be the means of saving him from pauperism.

The fourth section of this bill provides "that it shall be unlawful for any male alien who has not in good faith made his declaration before the proper court of his intention to become a citizen of the United States to be employed on any public works of the United States, or to come regularly or habitually into the United States by land or water for the purpose of engaging in any mechanical trade or manual labor for wages or salary, returning from time to time to a foreign country." The fifth section provides "that it shall be unlawful for any person, partnership, company, or corporation knowingly to employ any alien coming into the United States in violation of the next preceding section of this act."

The prohibition against the employment of aliens upon any public works of the United States is in line with other legislation of a like character. It is quite a different thing, however, to declare it a crime for an alien to come regularly and habitually into the United States for the purpose of obtaining work from private parties, if such alien returns from time to time to a foreign country, and to constitute any employment of such alien a criminal offense.

When we consider these provisions of the bill in connection with our long northern frontier and the boundaries of our States and Territories, often but an imaginary line separating them from the British Dominions, and recall the friendly intercourse between the people who are neighbors on either side, the provisions of this bill affecting them must be regarded as illiberal, narrow, and un-American.

The residents of these States and Territories have separate and especial interests which in many cases make an interchange of labor between their people and their alien neighbors most important, frequently with the advantage largely in favor of our citizens. This suggests the inexpediency of Federal interference with these conditions when not necessary to the correction of a substantial evil affecting the general welfare. Such unfriendly legislation as is proposed could hardly fail to provoke retaliatory measures to the injury of many of our citizens who now find employment on adjoining foreign soil.

The uncertainty of construction to which the language of these provisions is subject is a serious objection to a statute which describes a crime. An important element in the offense sought to be created by these sections is the coming "regularly or habitually into the United States." These words are impossible of definite and certain construction. The same may be said of the equally important

words, "returning from time to time to a foreign country."

A careful examination of this bill has convinced me that for the reasons given and others not specifically stated, its provisions are unnecessarily harsh and oppressive, and that its defects in construction would cause vexation, and its operation would result in harm to our citizens.

GROVER CLEVELAND.

EXECUTIVE MANSION, March 2, 1897.

March 3, the House reconsidered the measure and passed it over the presidential veto by a vote of 195 yeas to 37 nays; but in the Senate the subject was merely referred to the Committee on Immigration.

Postal Matters.—Dec. 8, 1896, the measure providing for limited indemnity for loss of registered mail matter was called up in the House. It is as follows:

"Be it enacted, etc., That section 3926 of the Revised Statutes be amended so as to read as follows:

"SEC. 3926. For the greater security of valuable mail matter the Postmaster-General may establish a uniform system of registration, and as a part of such system he may provide rules under which the sender or owners of first-class registered matter shall be indemnified for losses thereof in the mails, the indemnity to be paid out of the postal revenues, but in no case to exceed \$10 for any one registered piece, or the actual value thereof when that is less than \$10, and for which no other compensation or reimbursement to the loser has been made: *Provided*, That the Post Office Department or its revenues shall not be liable for the loss of any other mail matter on account of its having been registered."

In support of the measure the argument of the Postmaster-General for such a policy was read:

"In the report of last year, submitted by my predecessor, attention was called to the expediency of a law authorizing the payment of an indemnity, not exceeding \$10 in any case, for losses of registered matter in the mails.

"I beg leave to renew this recommendation. It is part of the system of registration in most of the leading countries of the world, and would add to the popularity of our own system if adopted. It seems, besides, but equitable that after matter has been put into the mails, at an increased cost over ordinary matter, and with a special view to its security, the Government should, to a limited extent at least, guarantee its safety. In addition to this, I am of the opinion that such a modification of the system would prove so popular that in a short time nearly all valuable matter to be sent through the mails would be registered, so that but few losses would be likely to occur, and these could be much more satisfactorily investigated and located than is the case when losses occur in the ordinary mails. The saving to the Government in the investigation of such losses would probably more than repay it for the amount expended for indemnity.

"This is a matter that will no doubt be brought before the Postal Union Congress, which is to meet in this city in 1897; but before that time a law should be enacted authorizing the introduction of this reform into our domestic postal system.

"Five thousand two hundred and eighty complaints pertaining to the registered mail were received during the year. Of this number 2,513 alleged the rifling or abstraction of the contents of the letters or packages, and 2,302 announced the entire loss of the letter or package and contents. Only 19 complaints of carelessness by postal employees were received.

"A comparison of the office records for the last two fiscal years shows that the total number of complaints affecting the registered mail during the fiscal

year 1895 was less by 646 than the total number of complaints of the same character received during 1894, a ratio of decrease of nearly 11 per cent. It is worthy of note that the total number of actual losses which occurred in the registered mail during the last fiscal year was 435 less than those determined during the previous year, or a decrease of a little more than 24 per cent. The statistics of the department show that the employees of the postal service handled, approximately, 14,428,081 pieces of registered mail during the last fiscal year, with the inconsiderable loss of 1 piece in every 21,305 handled.

"The number of pieces of mail matter registered during the year was 14,428,081, of which 11,744,525 were paid registrations and 2,683,556 were official or free. This shows a falling off in paid registrations of 5.7 per cent. The decrease in the aggregate of fees collected is \$57,333.04."

In explanation of the bill and the results which it was designed to accomplish, Mr. Loud, of California, said:

"Mr. Speaker, an investigation of the registration branch of the post office will show that we are gradually losing our registration business, while we are still maintaining the expensive machinery which that branch of the postal service demands. The express companies throughout the country, which guarantee indemnity in case of loss, are gradually absorbing all this class of business, which was formerly done by the Post Office Department, and to those who have looked into the matter it seems quite clear that the time has arrived when we ought either to go out of the registration business or else provide some such system as is here proposed, whereby the people may have a guarantee of the safety of such matter as they confide to the charge of the department, or some measure of indemnity for its loss. The Government charges a very liberal fee for registration for packages and letters, 8 cents, and the registration department is one of the most profitable branches of the service. For several years past Postmasters-General have called the attention of Congress to the necessity of providing for some limited indemnity for losses incurred by persons who send registered matter through the mails. Now, on the basis of the packages lost in the year 1895 (and the amount of loss upon packages is being continually reduced) it would have cost this Government not more than \$25,000 had we paid \$10 for every package that was lost.

"The Post Office Department is becoming more perfect in its operations day by day—more careful in the execution of its business; and, as I have remarked, the number of lost packages is decreasing year by year. We therefore have no right to assume that the ratio will increase. But we do assume that if we can give a guarantee of the safe delivery of matter confided to the care of the Post Office Department our registration will increase to the extent not merely of \$25,000 a year, but \$50,000 or \$75,000 a year, and of this amount at least one half would be clear profit to the Government.

The measure passed the House without serious opposition, and was taken up and passed by the Senate, Feb. 24, 1897, without a division. It was approved by the President, Feb. 27.

A bill concerning delivery of letters in towns, villages, and other places where no free delivery exists was reported and passed the House, Dec. 8, 1896, as follows:

"Be it enacted, etc., That whenever not less than 20 persons who receive their mail matter through the same post office shall petition the postmaster at such office to appoint one or more letter carriers, who shall be at least sixteen years of age, for the delivery of letters and other mail matter therefrom

to the persons addressed, at their respective residences or places of business, and for the collection of letters and the conveyance and delivery of them to the post office, said postmaster shall appoint a suitable number of letter carriers for that purpose, and it shall be their duty to report at least once a week to the postmaster appointing them the number of pieces delivered and collected by them and amount paid therefor.

"Sec. 2. That at all places where the foregoing delivery and collections may be authorized under this act the letter carriers thus appointed may receive of the person to whom he delivers letters or papers, or from whom he receives them for conveyance to the post office, such weekly, monthly, or quarterly compensation as may be mutually agreed upon; and when no such agreement is made, they may demand and receive not exceeding 1 cent for each letter or other package which they deliver from or convey to the post office: *Provided*, That the sum which each carrier thus collects shall be in full for his services; and none of such carriers shall have any claim upon the Post Office Department for compensation for services rendered as a letter carrier: *Provided further*, That no letter or other mail matter shall be given to such letter carrier for delivery unless addressed to a person who has lodged at the post office a written request that his mail matter be delivered to such letter carrier: *And provided further*, That if any person who shall have filed such written request shall refuse or neglect to pay the amount agreed upon or fixed by this act for the delivery or collection of any mail matter, the same may be returned by the carrier to the post office, and thereafter the carrier shall not be required to deliver or collect any mail to or from such person. Each person so appointed shall give bond to the postmaster for the faithful performance of his duties in the penal sum of \$100.

"Sec. 3. That the letter carriers appointed by authority of this act shall be subject to all the provisions of existing laws not inconsistent with this act."

Mr. Sperry, of Connecticut, said in explanation of the measure:

"You know in many of our large agricultural communities it takes a man sometimes two hours to go to the post office. You take it in cold weather, when there is snow on the ground, or in harvest time, and the farmer can ill afford to spare those two hours, or one hour, as the case may be, to go to the post office for his letters, possibly nine times out of ten returning without anything, and yet his valuable time is lost. Under this system the carrier himself, who shall be appointed by the postmaster to serve the villages and towns in which the post office is located, can go and take from the office these letters or newspapers and deliver them to the various parties to whom they are addressed, and receive therefor the rate of compensation agreed upon between the carrier and the people served. Should they like to have a letter mailed, the letter carrier would charge the same price or whatever may be agreed upon. In my judgment, should this system go into operation, our income from the various country post offices and villages would be increased very largely. I remember the first street-lamp boxes that were put up in 1860. It was said when these boxes were put up that it involved a cost that the people would not submit to; that it was a great charge upon the Government. But I know from my own experience in the New Haven post office that in less than six months after these letter boxes had been placed upon the street corners, giving the people an opportunity to mail their letters at any hour or at any moment, instead of going one mile or two miles to the post office to mail the same, it was

plainly shown that the receipts doubled, or nearly so, and the letter carriers' department soon commenced paying for itself.

"Now, you not only give these people the accommodation they want, whether in villages or rural communities, it matters not, but you will increase the receipts of the Post Office Department by giving people facilities, if you please, to mail and receive their letters. It is like running a horse car. If you run it once an hour you will not get nearly the number of passengers that you would get if you run it once in half an hour. If you can run it once in half an hour, and you change to once in ten minutes, you would get more than you would in the half hour. People will not wait. Give the people a chance, give the people facilities to receive their letters and to mail their letters, and according to the facilities given the increase will come. It is sure to come. There is no loss incurred at all by the Government. So long as the people want their letters carried in this way, let the farming communities—the villages and the towns of less than 10,000 inhabitants—have that privilege, they paying for it as agreed upon. It is the old penny-post system over again. There is nothing new about it. That penny-post system grew up into free delivery by and by, as you gave the people an opportunity to receive and mail their letters in the way convenient to themselves and without loss of time. Why withhold this privilege from the people so long as they are willing to pay for it, where it does not cost the Government one cent?"

Mr. Williams, of Mississippi, said:

"Now, Mr. Speaker, the proposed bill—the legislation it seeks to enact—is nothing but the development into law of a system which already exists in a part of this country. For example, down in my own country, in the State of Mississippi, there is a community of people—there are several of them, but I have in mind one community—who annually direct the postmaster to deliver their mail to a certain person selected by them to receive and deliver it. The carrier gets the mail from the post office and deposits it in boxes in front of the various plantations on his route, and takes from the boxes such mail matter as has been deposited by the planters, or the renters of the land, and carries it to the post office. So the common sense of a community in this country has already developed a scheme exactly that which the gentleman from Connecticut desires to put into the shape of law upon our statute books. And, in order to avoid the objection of undue expense, his bill provides that these carriers shall be paid by the people whose mail they deliver.

"Now, it is wrong, inherently wrong, that the great cities of this country should have their free delivery of mail matter, while the people living in more sparsely settled communities can not have such an advantage. But I recognize at the same time the fact that the free delivery of letters in sparsely settled localities would bring about an expenditure to the Government far beyond a due proportion of the number of letters or mail matter delivered, and all that; and each of us has practically surrendered to the idea that all of the great cities of the United States should have this free delivery, and that the citizen of the United States living in Philadelphia, for instance, should have favors shown him by the Government which a citizen living in the rural districts of Kansas does not have, and which can not be shown to him. I understand that the argument is always made, in answer to that, that the mail of Philadelphia, for example, pays its own way; but that is not true, because for every letter they send out from Philadelphia a letter is received there from some more sparsely settled section of the country."

The Senate passed the measure Feb. 25, 1897, but there is no record of its approval by the President.

Much greater interest was shown in what is called the Loud bill "to amend the postal laws relating to second-class mail matter." It was taken up in the House, Dec. 15, 1896, debated on various occasions with great spirit, and passed Jan. 6, 1897, in the following form:

"Be it enacted, etc., That mailable matter of the second class shall embrace all newspapers and other periodical publications which are issued at stated intervals and as frequently as four times a year, and are within the conditions named in sections 3 or 4 of this act: *Provided*, That nothing herein contained shall be so construed as to admit to the second-class rate publications purporting to be issued periodically and to subscribers, but which are merely books, or reprints of books, whether they be issued complete or in parts, whether they be bound or unbound, whether they be sold by subscription or otherwise, or whether they purport to be premiums or supplements or parts of regular newspapers or periodicals.

"SEC. 2. That publications of the second class, except as provided in section 25 of the act of March 3, 1879, when sent by the publisher thereof, and from the office of publication, excluding sample copies, or when sent from a news agency to actual subscribers thereto, or to other news agents, shall be entitled to transmission through the mails at 1 cent a pound or fraction thereof, such postage to be prepaid as now provided by law: *Provided, nevertheless*, That news agents shall not be allowed to return to news agents or publishers at the pound rate unsold periodical publications, but shall pay postage on the same at the rate of 1 cent for 4 ounces.

"SEC. 3. That all periodical publications regularly issued from a known place of publication at stated intervals as frequently as four times a year, by or under the auspices of benevolent or fraternal societies, trades unions, or orders organized under the lodge system, and having a *bona fide* membership of not less than 1,000 persons, shall be entitled, to the privilege of second-class mail matter: *Provided*, That such matter shall be originated and published to further the objects and purposes of such society or order.

"SEC. 4. That the conditions upon which a publication shall be admitted to the second class are as follows:

"1. It must regularly be issued at stated intervals as frequently as four times a year, bear a date of issue, and be numbered consecutively.

"2. It must be issued from a known office of publication, which shall be shown by the publication itself.

"3. It must be formed of printed paper sheets, without board, cloth, leather, or other substantial binding, such as distinguish printed books for preservation from periodical publications.

"4. It must be originated and published for the dissemination of information of a public character, or devoted to literature, the sciences, arts, or some special industry, and must have a legitimate list of subscribers who voluntarily order and pay for the same: *Provided*, That nothing herein contained shall be so construed as to admit to the second-class rate regular publications, or any particular issue of any regular publication, designed primarily for advertising purposes, or for free circulation, or for circulation at nominal rates: *And provided*, That all extra numbers of second-class publications sent by the publishers thereof, acting as the agent of an advertiser or purchaser, to addresses furnished by the latter, shall be subject to pay postage at the rate of 1 cent for every 4 ounces or fraction there-

of: *And provided further*, That it shall not be permissible to mail any given article or articles, or any part of any particular number of a newspaper or periodical, segregated from the rest of the publication, except at the third-class rate of postage.

"Sec. 5. That publishers and others, whose publications shall be admitted as mail matter of the second class under the provisions of this act, shall be required, before depositing such mail matter in the post office, to separate the same into United States mail sacks or bundles by States, cities, towns, and counties, as the Postmaster-General may direct.

"Sec. 6. That the act of Congress in regard to second-class mail matter approved July 15, 1894, be, and the same is hereby, repealed.

"Sec. 7. That this act shall take effect and be in force from and after July 1, 1896."

Mr. Loud said in opening the discussion:

"Mr. Chairman, many gentlemen here may assume, perhaps, that I have magnified the importance of this measure, but this measure received the commendation of the Post Office Department ten years ago. The officers of that department whose duty it is to carefully investigate the working of our postal system saw the gross abuses that had grown out of the laws of 1879 and 1885 and presented the question to Congress in 1887, and each year since that time they have begged and pleaded with Congress in no uncertain tones to give the administration of the Post Office Department some relief. The abuse has so grown in magnitude of late years that even the President of the United States in his last message called attention to the grievous evil which confronts us in the handling and carriage of second-class mail matter. I hope the House will pardon me while I read a few words from the report of the present Postmaster-General, a gentleman who has given this matter careful attention and study, aided and guided by the opinions of the officers who have gone before him for eight years. With that experience to draw upon, he took up the question and brought it down to the present time, and on page 6 of the report he uses this language:

"So disheartening is it for the responsible head of the department to see this waste of its earnings, with its resulting impairment of the efficiency of the postal service, its absorption of the fruits of good management and of careful economies, that but for the hope that Congress would enact the bill now on the House calendar I should have taken the responsibility to modify and reverse the successive rulings through which this inroad on the service has been effected, and to exclude from the benefit of second-class rates the serial libraries and other publications not in the policy of the law, even if within the letter of its rather loose phraseology. This would have imposed upon those who profit at the public expense by existing practices the necessity of seeking through the courts or otherwise the restoration of their special privileges."

"Mr. Chairman, I am satisfied that if the present Postmaster-General had another year to serve he would carry into execution the purpose set forth in this part of his annual report. For my part I do not believe that it was ever intended by Congress that serial novels should pass through the mails at pound rates, a privilege originally vested in the newspapers of this country, and confined to them up to 1879, when by a ruling of the Attorney-General at that time, Gen. Devens, it was held that a book issued in serial numbers was entitled to be carried at second-class rates under the rather loose phraseology of the law. With all due respect to the learning of the gentleman and to his honesty and integrity, I think he erred, because in the advertisements of these so-called serials throughout

the land even to-day they are not referred to as serial publications, but in their proper sphere, as books, and books alone.

"We all admit that this country is to-day in an unfortunate condition financially. While perhaps we may not all agree as to the remedy for the cure of the existing evil, we do all admit that from a financial standpoint this country is in an unfortunate position. Now this bill presents to this body the opportunity to relieve the country from a deficiency of \$10,000,000 already existing in the service of the Post Office Department, and give to it in addition a revenue of \$10,000,000 more. At the lowest calculation there is involved in this bill a saving to the Government of \$20,000,000 per annum, and if we may take the figures of Postmaster-General Wanamaker, acknowledged to be a good business man, and who was at that time in a position to know whereof he spoke—if we may take his estimate made in 1892, we must come to the conclusion that this iniquity—I will term it iniquity—costs our people more than \$40,000,000 annually. That is not much money, gentlemen, I am willing to admit, to us who deal with hundreds of millions as some people deal with dollars."

Mr. Loud went on to say that the essential points in the measure were simply the exclusion of books issued as serials and sample copies of periodicals from second-class mail matter, and that these changes would relieve the Post Office Department.

Mr. Quigg, of New York, who led the opposition to the bill, outlined his course of argument as follows:

"This bill is not only important, it is revolutionary; and it is not less reactionary than revolutionary. If this bill passes, for the first time since the Post Office Department was established Congress will have taken a step backward in the liberal policy it has maintained with regard to the public uses of the post office. If this bill passes, privileges and rights will be withdrawn and denied which have existed for half a century, privileges and rights so widely availed of that industries have been built upon them, trades and businesses established, and conditions of production and barter fixed. If this bill passes, a blow will be struck at every occupation connected with the art of printing and the business of publishing, circulating, and selling the product of the printing press. If this is so, and anybody can see at a glance that it is so, no argument is needed to enforce the assertion that we should be sure of our ground and be fully persuaded of compensating results to the public interest before we give our approval to such radical, such injurious and far-reaching legislation.

"Two pretenses are made with which to justify this bill. The first is that the mails are now being used in a way that the law did not intend or contemplate and that by this bill we are simply providing against abuses. The second is that its passage will save to the public Treasury the sum which the gentleman from California, by mathematical processes that are altogether bewildering, variously estimates from \$10,000,000 to \$40,000,000. If either of these pretenses could be established, if they were even credible, I should certainly support the bill in spite of the grievous injuries that its enactment must entail upon the industries and occupations to which I have just referred. But the facts in the case conclusively prove that the uses of the mails which this bill seeks to prevent were held in full contemplation when the law took its present shape, have since been repeatedly confirmed, and that the effect of the bill upon the revenue and expenditure of the Post Office Department is altogether problematical. Indeed, I think that the House will see before this debate is concluded that the inevitable loss of revenues in first- and fourth-

class postage will be quite as great as any possible saving by reason of the reduction of the cost of mail transportation and that the net effect of the bill will be to produce disaster to printers, binders, publishers, newsdealers, and paper manufacturers, without materially affecting the financial condition of the post office."

Mr. Kyle, of Mississippi, in support of the bill, attacked the discrimination in favor of serial publications and the character of some of those publications. He said:

"I call attention now to some statements made by Mr. Wanamaker upon this subject. It is not only Postmaster-General Wilson who has been struggling to get rid of this wrong, this imposition upon the people of this country, but also Postmaster-General Wanamaker and Postmaster-General Bissell. All three of these postmasters-general have been calling attention to this evil and appealing to Congress to relieve the department of this wrong. I call it a wrong because I believe it is a wrong, and I believe that if I had time I could demonstrate that it is a wrong. Here is what Mr. Wanamaker says about the carrying of these cheap books and the discrimination that is made in their favor:

"First. The enjoyment of the privilege of low postage by these paper-covered books works an injustice to the publishers of all other books. We all know that unnumbered thousands of books are issued every year in this country bound in cloth, leather, or some other substantial form of binding. There are also many books published with paper covers, the publishers of which make no pretense of issuing them as parts of a series or library of publications, they having the fairness to issue them under their true name—books. Now why should there be any discrimination against these books, either bound or unbound? Why should they be taxed, for carriage by mail, 1 cent for every 2 ounces, while those that come under what are called the serial class go through for a cent a pound? There are, indeed, actual instances of the same book precisely, issued with paper covers, but by different publishers, in the one case charged but a cent a pound and in the other eight times that amount. These distinctions are manifestly absurd and unjust, and while they operate advantageously to one class of publishers they are harmful to another."

"I say so, too. Why should there be any discrimination against books? And I want the man on this floor who is able to give a satisfactory answer to that inquiry of Mr. Wanamaker to do so. Why should there be a postal rate of 8 cents a pound upon a book with a cloth back while there is a charge of only 1 cent a pound on these paper-covered publications? Can any gentleman tell why? I pause for an answer. If there is any reason for discrimination, it is the other way. I believe the man who is trying to accumulate a library for himself and his family should be encouraged, rather than the fellow who is dealing in this cheap paper-back literature which is poisoning the youth of the land to-day. Mr. Wanamaker puts the question in such a way as to appeal to every man who opposes this bill to answer it, but no man has yet responded. The gentleman from New York occupied the floor for an hour and a half this morning talking to this committee, and he doubtless has read Mr. Wanamaker's presentation of this question and has been impressed with the injustice and the inequality of the existing law, and he did not undertake to answer."

"Let me call attention now briefly to what Mr. Wanamaker said with reference to this class of literature:

"There are many novels of that class which every librarian who has any regard for the morals of the community deprecates the existence of, novels which depict, sometimes in the most seductive, sometimes in the most repulsive aspects, the decline and fall of woman—novels in which, where there is not a seduction there is an adultery, and where there is not an adultery there is a seduction, and very frequently there are both. Now what kind of literature is that to bring into domestic circles, to be put forth by the thousand, and scattered all over your country, to the exclusion, or at least to the prejudice, of decent and elevating literature?"

"What kind of literature is that to bring into the domestic circle by these cheap rates of postage?"

Mr. Burton, of Ohio, said of the "sample-copy" abuse:

"Now I do not believe we will any of us object to the sample copy, if restricted to its proper use, for which it was originally intended, namely, that of sending out copies of *bona fide* publications, so that persons may judge of their merit and decide whether to subscribe or not. But the trouble is an abuse has grown up from this system which can not be separated from its legitimate use. One single periodical sends out monthly, under the sample-copy privilege, 1,250,000 copies. It is not a newspaper. It is a travesty to call it such. There are many similar sheets. It appears from the report of the Postmaster-General that the increase during six years in newspapers entered for circulation at the post office as second-class matter was 24,304, but the actual number of periodicals which during that time obtained standing in the newspaper directory was 3,747. So, as Postmaster-General Bissell stated, only 15 per cent. of those included under the designation of second-class matter were legitimate newspaper publications."

"These go in enormous quantities. They are a cheap advertising medium. They are sent indiscriminately over the country. Advertisers, realizing the fact that they go in the mail almost for nothing, and are scattered far and wide, are willing to pay large prices for the privilege of advertising in their columns. And right here I wish to pay attention to the leading argument made in favor of this sample-copy privilege. It is claimed that while these copies are carried at a loss to the Government, yet the Government makes up for the loss in other ways. It is said that letters come to the publisher of the sample copy. He offers prizes. All of which stimulates the post-office business. To that a sufficient answer is, that there is just so much money that the people of this country have to spend. There is just so much business they can transact, and they will transact just as much business, write just as many letters, and pay attention to a great deal better class of advertisements, if this business of advertising is restricted to the legitimate newspaper and the ordinary way of doing business. Indeed, there will be an improvement, because with the greater responsibility and degree of care which must be exercised by the regular newspaper in regard to matter in its columns, there will be a higher standard, and money will be invested in a better way."

The case against the measure was put most effectively by Mr. Tracey, of Missouri, who said:

"Mr. Chairman, it would be immaterial who does the business unless it should be done at an increased cost to the people. But I submit if the effect of this legislation is to transfer the business now done by the Post Office Department to the express companies, which, in the absence of the only competition possible, increases the cost of transportation and handling to the people, the legislation is un-

wise and ought to be defeated. That the bill under consideration would have that effect appears to be recognized by the chairman of the committee, and he answers by saying he does not care.

"Now, Mr. Chairman, it would seem to me that no argument should be necessary to convince any one that the cost of carrying the different classes of mail matter varies materially. If the argument adduced from the position taken and the assumptions made finds itself based on a false assumption, then the argument itself necessarily falls to the ground. It must be apparent that the cost of handling and carrying first-class mail matter is much larger than the cost of carrying and handling second-class matter. The handling of the pieces of mail matter known as first-class matter involves a large number of separate handlings. In the first place, the stamps must be printed, distributed, and canceled. Every piece of first-class mail matter passes through from three to four postmarkings. Then, in addition to that, the various distributions which do not obtain in second-class mail matter must be taken into consideration.

"In handling second-class mail matter, under the present laws and regulations a large amount of the handling, perhaps one half of it fully, is done by the publishers themselves. The publications are assorted into mail sacks for States, cities, counties, etc., and are delivered in that condition to the Post Office Department, and by it delivered to the various places along the various postal routes. It must be evident, therefore, that the cost of handling that class of matter is not at all equal to the cost of handling first-class matter.

"But let us give an illustration of the methods of reckoning adopted by the committee with reference to this matter. Now, it is alleged—and the attack made upon the existing law is based upon the allegation—that it costs 84 cents per pound to carry all of this matter which it is sought by the bill to cut out of the privilege it enjoys under the present rate.

"During the year ending June 30, 1894, there was an increase of 43,000,000 pounds of second-class mail matter carried. The methods of computation adopted by the committee give the expense of carrying this increase in the amount of second-class matter to the department, and, according to their methods of computation, it must have been the sum found by multiplying 43,000,000 pounds by 84 cents per pound, which it is alleged to have cost, or in the aggregate \$3,635,000.

"Now, it is shown by the report of the Second Assistant Postmaster-General of the same year that the total increase of the expenses of the department was but \$1,777,362.22, and that increase covered not only the cost of carrying the mails, but it covered also the cost of securing 766 new routes, representing an increase of 913-37 miles, with an actual increase in the distance traveled of 15,310,780-61 miles, and included the salaries of railway and post-office clerks necessary, and special facilities and mail equipment. The average cost of carrying the mails per mile for that year is stated to have been 11-43 cents. At that rate, the cost to the department of the increased facilities must have been \$1,750,022.21. Take away from the increased cost of running the department in that year the cost of obtaining and conducting the increased mail facilities for that year, and it leaves the total increase of cost of carrying the mails at \$27,340.01. And yet we are told by the committee in the face of these facts, which are in the reports cited by the committee and approved by them, that the chief cost due to the carrying of this second-class matter to which they object at the pound rate was \$3,635,000.

"Now, if the committee can present any sort of demonstration to the House which will unravel that problem, it will do more than has yet been done by any member of the committee, and more than I believe to be within the possibilities. If the increased expense for transportation and mail service generally costs \$1,777,362.22, and the increased facilities thereby secured are valued at \$1,750,022.21, how much did it actually cost the department to carry the 43,000,000 additional pounds of second-class matter?

"The cost of carrying the second-class matter is not at all what it is alleged to be. For the reason that I stated at the outset, a large proportion of the cost is paid by the publishers of these publications, who assort them, separate them, put them into sacks for delivery along the postal routes, at no expense to the Government other than the mere transportation and delivery by the Post Office Department at the points of destination. It does not require a very wise carrier to understand that if he has a wagon and team capable of carrying 50 boxes of goods of any kind and he has but 40 to carry, the expense of his trip is not thereby reduced. On the contrary, the humblest drayman understands that the offer of 10 additional boxes would increase his receipts without increasing his expenses (wear and tear excepted). In fact, it would be just that much money found.

"I have not time to say all that I should like to say upon this bill. It seems to me that, instead of having the title which is given to it, it ought to be entitled 'A bill to tax the dissemination of intelligence among the people.'

"While there have been and are abuses which ought to be remedied in the administration of the postal system, it is unquestionably true that under the operation of existing laws and regulations the United States leads the world in the production of newspapers and periodicals of the highest grade and at the lowest prices. The publishing business of the country is not conducted as a charity; it is a business, and is engaged in and conducted for a profit. When the profit ceases the business fails or is abandoned. The postage is an item of expense that is taken into account as is any other item of expense. Had this bill been in operation during the past twenty years the magnificent daily newspapers now published at 1 cent per copy in all parts of the country, a mirror of the world's doings up to the hour of going to press, would have been an 'iridescent dream.' If there were no other objection to the bill, this ought to be sufficient to insure its defeat.

"But it strikes a harder blow, if possible, at the country newspapers, which at best have a hard row to hoe. And the country newspapers are entitled to the highest consideration in any legislation which proposes to change existing postal laws and regulations. The right to send out sample copies, the right to send a copy free to a friend, the right to exchange with other papers, the right to continue a subscription after the time paid for has expired, the right to offer as an inducement for additional subscribers a premium in the shape of a supplement containing some work of fiction, the right to combine his own paper with some metropolitan weekly which is furnished at a very low price, are all regarded as valuable, and, speaking from personal experience, they are valuable. All of these rights are jeopardized by this bill, if they are not entirely swept away. It is not a hazardous proposition to say that if this bill becomes a law the country press, the mainstay of patriotism and devotion to free institutions among the masses of the people, will be weakened financially and weakened in its ability for good. The splendid country weeklies

of to-day, carrying to the homes of the people each week a volume of excellent and varied information, will in all probability be reduced to the decrepit weeklies of a quarter of a century ago, in which were merely chronicled the sayings and doings of the neighborhoods in which they were published. This would be a calamity.

"The bill proposes to drive out of the second class into the third class, or out of the mails entirely, all books or reprints of books, whether they be issued complete or in parts, whether they be bound or unbound, whether they be sold by subscription or otherwise, or whether they purport to be premiums or supplements or parts of regular newspapers; all sample copies of newspapers or periodicals; all exchange copies of newspapers or periodicals; all copies sent free by the publisher; all unsold copies returned to news companies or to the publishers. And, in addition to all this, it invests the Post Office Department with supreme power to adopt such rules and regulations for the determination of any question affecting the right of a newspaper or periodical to be carried in the mails as second-class matter as practically creates a press censorship; narrows the field now occupied by a large portion of the press of the country, and necessarily cripples its usefulness. All this is proposed in the interest of economy in the service, upon a theory which has been shown to be visionary and unsound.

"Third-class matter costs the Government to handle more than double what it costs to handle second-class matter. It covers printed matter other than periodical publications. In addition to the handling and furnishing and canceling of stamps, the packages must be handled and sorted, both at the office of deposit and that of delivery. The mails are used as a rule only to send small packages, or to places remote from the railroads, and which are not reached by the express companies.

"The express companies carry this class of matter to practically all of their delivery points, under a special 'printed-matter' rate, at 2 cents per package less than the mail rate. The rate is advertised as 10 cents for each 1½ pound or less, and for single packages exceeding 1½ pound, 1 cent for each additional 2 ounces. The third-class mail rate for 1½ pound is 12 cents, and 1 cent for each additional 2 ounces or fraction. This 'printed-matter' rate was evidently adopted by the express companies for the purpose of securing the handling of all such matter as can be handled profitably, leaving to the Government the handling of packages costing less than 10 cents per package, or destined to remote points not reached by the companies. This becomes very apparent when it is remembered that the 'printed-matter' rate was not the result of competition among the companies, but was a 'pool' agreement among them. For the year ending June 30, 1894, the pieces of third-class matter carried by the mails only amounted to about 12 per cent. of the whole number of pieces of mail carried, and the percentage has not increased very much, if any, since. Under the operation of this bill, should it become a law, all of the matter transferred from the second class to the third class which can be profitably handled will be carried by the express companies.

"When the declaration of the chairman of the committee that 'he does not care' is remembered, along with the significant fact that the express companies are all for the bill, is it wholly unwarrantable to inquire if the bill is not framed rather in the interest of the express companies than of the people? If the express companies continue to handle the profitable third-class matter, which they will do as long as they have a cheaper rate, how

will the increase of third-class matter through the transfer to that class of matter now in the second class decrease the deficit in the revenues of the department? Since it costs about as much to operate a postal car carrying 10 tons of mail as it does when it carries 20 tons, inasmuch as the operating expenses of the department are not seriously decreased by a decrease in the amount of mail handled, the question of how this bill enacted into law will enable the Post Office Department to become self-sustaining becomes a problem which will probably wait for a solution until it is demonstrated how one from 2 leaves 3."

The measure was reported with amendments in the Senate by a majority of the committee on post offices and post roads, and Mr. Butler, of South Carolina, presented a minority report in opposition.

The majority report said:

"This bill was received from the House on Jan. 7, 1897. The committee found a widespread interest in the bill prevailing throughout the country; on the one hand on the part of those patrons of the mails sending second-class matter, who appeared to desire to preserve the present system substantially as it exists, and on the other hand on the part of those who wish alleged abuses to be corrected, hoping that the saving in expenditure thereby effected will enable the Post Office Department, without too great an increase of its annual deficit in revenues, to give to the public a 1-cent rate of postage on single letters, or otherwise to give benefits to the community not now attainable. Hearings were asked for on both sides and given by the committee on the 16th, 23d, and 30th days of January.

"As time has passed, it has seemed to the committee that with the wide difference of opinion existing between the various interests and also among members of the committee as to the extent of existing abuses and the proper method of providing remedies, it will not be possible to secure passage of the bill through the Senate at the present session.

"The committee, however, report the bill to the Senate, with certain amendments prepared by the acting chairman, in order that it may be taken up for consideration, if time permits, each member reserving opinion upon the amendments and the bill until they come up for consideration.

"The committee also recommend that a postal commission be created by legislation, as follows:

"That the questions concerning the correction of alleged abuses in the postal service in connection with second-class mail matter, the extension of free delivery to rural regions, the reduction of the cost of the railroad transportation of the mails, the adoption of 1-cent postage for single letters, and other like questions, shall be examined by a postal reform commission of five, to consist of the two chairmen in the Senate and House of the present Committees on Post Offices and Post Roads, the Postmaster-General, and two citizens to be appointed by the President, who shall make their report and recommendations for legislation to the next Congress; and for the services of said civilian commissioners and the expenses of said commission the sum of \$10,000 is hereby appropriated, to be immediately available and to be expended according to the direction of the Postmaster-General; said commission to expire on the 31st day of December, 1897."

The minority report asserts the deficiencies in the Post Office Department to be due to exorbitant rates paid for mail service:

"The attempt to reform the mail service and reduce expenses in the manner proposed by this bill, without any information from the department or otherwise as to what are the abuses, seems to the

undersigned as very inopportune, and is, at least, a leap in the dark, if there are no interested parties promoting the legislation. It will be seen by a letter from the Postmaster-General, attached to this report, that the department has no information which will enable it to point out what class of matter sent through the mails occasions the deficit. The department is unable to make any estimate of the cost of carrying newspapers, and particularly the great Sunday dailies, through the mails, and the cost of carrying the literature which is authorized by law. It is stated that the average cost of all mail matter is over 8 cents per pound, or \$160 per ton. It seems to the undersigned that a great reduction might be made in the aggregate cost of carrying the mails. It will be observed that the second-class matter pays 1 cent per pound, or \$20 per ton, and as this goes in bulk the expense of handling it can not be greatly in excess of the expense of handling ordinary freight. The average distance which this second-class matter would, we should suppose, without accurate information, certainly make the charge more than 1 cent per ton per mile, which is largely in excess of ordinary freight rates. The enormous cost of \$160 per ton for carrying the mails, it seems to the undersigned, can not be accounted for by the expense of handling the letter mails and business connected with the first-class mail matter. This amount is certainly many times the cost of the service rendered. Neither the express companies nor private individuals pay any such rate.

"Without any means of making an accurate examination ourselves, our attention has been called by various persons professing to be experts to the extravagance of the department in dealing with the railroad companies. A very able and carefully prepared article on this subject, written by Hon. James L. Cowles, the author of 'A General Freight and Passenger Post,' appeared in the February number of the 'Outlook.' This article proves very clearly that the deficit is caused by the very exorbitant and unreasonable rates which the Government now pays to railroads for carrying the mails. The New York 'World,' among others, published a statement on Jan. 30, showing that a saving could be made of more than the deficiency by proper supervision and contract with the railroads and the enormous amount paid for the leasing of cars, which could be largely saved if the Government owned its own cars. The saving which could be made in this respect alone is estimated by experts to amount to at least \$10,000,000 per year. Of course, the undersigned is unable at this time to go into details with regard to these matters, but, on a cursory examination, is thoroughly satisfied that the deficiency in the mails results from—

"First, the exorbitant charges paid the railroads for the use of mail cars.

"Second, the very liberal contracts which the Government makes with the railroad corporations for carrying the mails. The amount paid per ton is enormously and absurdly high.

"Third, the lax supervision which the Government exercises over the performance of the service, and especially with reference to the amount of matter which the railroads profess to haul, and for which the Government is charged.

"The statements that the present postal deficit is due to the transportation of second-class postal matter at 1 cent per pound are altogether misleading—I had almost said intentionally misleading. It seems perfectly clear from the facts presented in the articles above referred to that the postal deficit is not due to the 1-cent-a-pound postal rate paid to the Government by the people, but to the 8-cent-a-

pound tax levied on the Government by our railway kings, and this, although the service would yield a handsome profit at one half a cent per pound. The Government pays the railroads for a great deal more weight than the mails really haul. It is the fault of the Government that this is done. Besides, the contract price is utterly too high. During the last twenty years freight rates have been reduced about 40 per cent., yet the Government is now paying about the same rates that it did twenty years ago. Why do not those who are so much concerned about the deficit in the Post Office Department turn their attention to these big leakages and gross abuses? Let those who profess to favor economy and reform help to correct these abuses."

The measure was not put to a passage in the Senate.

Copyright.—Feb. 9, 1897, the House passed a bill amending the copyright law, which the Senate amended and passed on March 3, as follows:

"Be it enacted, etc., That section 4963 of the Revised Statutes of the United States be, and the same is hereby, amended so as to read as follows:

"SEC. 4963. Every person who shall insert or impress such notice, or words of the same purport, in or upon any book, map, chart, dramatic or musical composition, print, cut, engraving, or photograph, or other article, whether such article be subject to copyright or otherwise, for which he has not obtained a copyright, or shall knowingly issue or sell any article bearing a notice of United States copyright which has not been copyrighted in this country; or shall import any book, photograph, chromo, or lithograph, or other article bearing such notice of copyright or words of the same purport, which is not copyrighted in this country, shall be liable to a penalty of \$100, recoverable one half for the person who shall sue for such penalty and one half to the use of the United States; and the importation into the United States of any book, chromo, lithograph, or photograph, or other article bearing such notice of copyright, when there is no existing copyright thereon in the United States, is prohibited; and the circuit courts of the United States sitting in equity are hereby authorized to enjoin the issuing, publishing, or selling of any article marked or imported in violation of the United States copyright laws, at the suit of any person complaining of such violation: *Provided*, That, this act shall not apply to any importation of or sale of such goods or articles brought into the United States prior to the passage hereof.

"SEC. 2. That all laws and parts of laws inconsistent with the foregoing provision be, and the same are hereby, repealed."

The measure was approved by the President.

The Congress passed, for the protection of dramatic and musical authors, the following amendment to the copyright laws, which the President duly approved:

"Be it enacted, etc., That section 4966 of the Revised Statutes be, and the same is hereby, amended so as to read as follows:

"SEC. 4966. Any person publicly performing or representing any dramatic or musical composition for which a copyright has been obtained, without the consent of the proprietor of said dramatic or musical composition, or his heirs or assigns, shall be liable for damages therefor, such damages in all cases to be assessed at such sum, not less than \$100 for the first and \$50 for every subsequent performance, as to the court shall appear to be just. If the unlawful performance and representation be willful and for profit, such person or persons shall be guilty of a misdemeanor and upon conviction be imprisoned for a period not exceeding one year. Any injunction that may be granted upon hearing after

notice to the defendant by any circuit court of the United States, or by a judge thereof, restraining and enjoining the performance or representation of any such dramatic or musical composition may be served on the parties against whom such injunction may be granted anywhere in the United States, and shall be operative and may be enforced by proceedings to punish for contempt or otherwise by any other circuit court or judge in the United States; but the defendants in said action, or any or either of them, may make a motion in any other circuit in which he or they may be engaged in performing or representing said dramatic or musical composition to dissolve or set aside the said injunction upon such reasonable notice to the plaintiff as the circuit court or the judge before whom said motion shall be made shall deem proper; service of said motion to be made on the plaintiff in person or on his attorneys in the action. The circuit courts or judges thereof shall have jurisdiction to enforce said injunction and to hear and determine a motion to dissolve the same, as herein provided, as fully as if the action were pending or brought in the circuit in which said motion is made.

"The clerk of the court, or judge granting the injunction, shall, when required so to do by the court hearing the application to dissolve or enforce said injunction, transmit without delay to said court a certified copy of all the papers on which the said injunction was granted that are on file in his office."

The reasons for this action are set forth in the committee report in favor of the measure:

"The purpose of the proposed measure is twofold: First to secure to musical compositions the same measure of protection under the copyright law as is now afforded to productions of a strictly dramatic character. There can be no reason why the same protection should not be extended to one species of literary property of this general character as to the other, and the omission to include protective provisions for musical compositions in the law sought to be amended was doubtless the result of oversight. The committee is of the opinion that the existing law should be so amended as to provide adequate protection to this species of literary production.

"The bill provides, secondly, for added means for the protection of authors of dramatic and operatic works.

"In recent years the business of producing and staging plays and operas by American authors has largely increased, and in many instances have met with the very highest measure of success. Many of the best stage productions of modern times have been the work of American authors.

"These productions in many instances have been carefully and elaborately placed upon the stage at very heavy expense to proprietors and managers, and their representation has given employment in various ways to thousands of people.

"The existing law relative to copyrights has been found to be inadequate to properly protect authors and producers of American plays and operas in the enjoyment of their rights of property in these duly copyrighted productions.

"Persons in various sections of the country have, without the shadow of right or authority, pirated these works, and, continuing their operations chiefly to the smaller and more remote towns, have given representation of these stolen productions for their own individual profit, and without making any compensation whatever to authors or owners. Under existing conditions no adequate remedy exists for this unlawful usurpation of property rights.

"The offenders are almost uniformly men without attachable means, and defy all the ordinary processes by which they might be mulcted in damages. The representation of these pirated produc-

tions is generally given for a night or two only at a given place, and the offenders flit from section to section and from State to State and bid defiance to the processes of the courts seeking to restrain their unlawful acts.

"Serious embarrassments have arisen in the efforts to enforce these judicial orders and to punish offenders for disobedience of them.

"While it is true that an injunction order issued by a court of competent jurisdiction is operative upon the conscience of the party restrained everywhere in the United States, it appears that an attachment for contempt of such order can not be executed except in the circuit of the court which issued the original order, and this bill seeks to overcome this difficulty.

"The bill further provides that the piracy, the unlawful production of any duly copyrighted play or opera, if it be determined that such unlawful representation was willful and for profit, shall be a misdemeanor, and shall subject the offender, upon conviction, to the liability of imprisonment for a period not exceeding one year.

"The reason for the enactment of this provision has already been outlined.

"The unauthorized publication of a copyrighted book may ordinarily be adequately punished through civil proceedings and under the provisions of existing law. The offender in such case is a person of fixed domicile, and has a press and the implements of his business, so that the ordinary processes of the court may readily be served upon him, and he may be compelled to respond in damages for his wrongdoing.

"These conditions do not exist, as a rule, in the case of the professional play pirate.

"It is difficult to serve him with injunction and court orders because of his migratory habits, and as he is frequently without attachable means it is impossible to satisfy a money judgment against him.

"Testimony has been adduced before the committee showing that the losses accruing to authors and owners of copyrighted productions by these piracies amount to large sums each year. So little protection is in fact afforded under existing conditions that many prominent American dramatic authors no longer go to the trouble and expense of taking out copyrights for their works.

"Conceding that for light causes nothing should be added to the jurisdiction or powers of the Federal courts, it would seem that the circumstances in connection with the wholesale piracy of these productions of native authors demand that something more nearly akin to drastic measures should be invoked to remedy the evil."

Selling Liquor to Indians.—Jan. 18, 1897, the House took up and passed the following measure, to prohibit the sale of intoxicating drinks to Indians, providing penalties therefor, and for other purposes:

"Be it enacted, etc., That any person who shall sell, give away, dispose of, exchange, or barter any malt, spirituous, or vinous liquor, including beer, ale, and wine, or any ardent or other intoxicating liquor of any kind whatsoever, or any essence, extract, bitters, preparation, compound, composition, or any article whatsoever, under any name, label, or brand, which produces intoxication, to any Indian to whom allotment of land has been made while the title to the same shall be held in trust by the Government, or to any Indian a ward of the Government under charge of any Indian superintendent or agent, or any Indian, including mixed bloods, over whom the Government, through its departments, exercises guardianship, and any person who shall introduce, or attempt to introduce, any malt, spirituous, or vinous liquor, including beer,

ale, and wine, or any ardent or intoxicating liquor of any kind whatsoever into the Indian country, which term shall include any Indian allotment while the title to the same shall be held in trust by the Government, or while the same shall remain inalienable by the allottee without the consent of the United States, shall be punished by imprisonment for not less than sixty days, and by a fine of not less than \$100 for the first offense and not less than \$200 for each offense thereafter: *Provided, however*, That the person convicted shall be committed until fine and costs are paid. But it shall be a sufficient defense to any charge of introducing, or attempting to introduce, ardent spirits, ale, beer, wine, or intoxicating liquors into the Indian country that the acts charged were done under authority, in writing, from the War Department or any officer duly authorized thereunto by the War Department.

"Sec. 2. That so much of the act of the 23d day of July, 1892, as is inconsistent with the provisions of this act is hereby repealed."

The necessity for such legislation was set forth in the report of the Committee on Indian Affairs, which said:

"This proposed legislation amends the existing statutes in three particulars: First, it makes it unlawful to sell, give away, dispose of, exchange, or barter 'any essence, extract, bitters, preparation, compound, composition, or any article whatsoever under any name, label, or brand which produces intoxication'; second, the punishment 'by imprisonment for not more than two years, or by a fine of not more than \$200 for each offense' is changed to 'imprisonment for not less than sixty days and by a fine of not less than \$100 for the first offense, and not less than \$200 for each offense thereafter'; third, the term Indian is defined to embrace an Indian 'to whom allotment of land has been made, while the title to the same shall be held in trust by the Government'; an Indian 'a ward of the Government under charge of any Indian superintendent or agent'; or an Indian, 'including mixed bloods, over whom the Government, through its departments, exercises guardianship.'

"The vendors of intoxicating liquors on Indian reservations have used every possible device and scheme to evade the Indian Bureau, the authorities, and law, until they have gone to the extreme of having intoxicating liquors, under labels or brands of essences, extracts, bitters, preparations, compounds, or compositions containing pickles, fruits, and other articles of diet, specially prepared for this traffic with the Indians.

"The violators under the present law, which provides they 'shall be punished by imprisonment for not more than two years, or by a fine of not more than \$200 dollars for each offense,' are pleased to pay the small fine imposed by the courts, gain their liberty, and return to the reservation to continue the occupation of their nefarious traffic. The minimum punishment in this bill is sixty days' imprisonment and a fine of \$100 for the first offense, and a fine of \$200 for each offense thereafter.

"The district courts of the United States have held that a sale of intoxicating liquors to an Indian to whom an allotment of land has been made does not, under the existing statutes, constitute an offense."

The measure was strongly urged by the Secretary of the Interior, the Commissioner of Indian Affairs, the United States district attorney, and the Indian Rights Association. The Senate passed it Jan. 23, and it was approved by the President Feb. 5.

Commerce and Navigation.—The House passed a bill to amend the laws relating to navigation; and the Senate adopted a substitute measure, in which the House refused to concur. A conference

committee was appointed and reported the bill in the following form, which was reported by House and Senate on the last day of the session and approved by the President:

"*Be it enacted, etc.* That section 4507 of the Revised Statutes be, and is hereby, amended to read as follows:

"*Sec. 4507.* The Secretary of the Treasury shall assign in public buildings or elsewhere, for suitable offices and rooms for the shipment and exchange of currency, to be known as shipping and exchange offices, and shall procure furniture, stationery, printing, and other requisites for the transaction of the business of such offices."

"*Sec. 2.* That on and after June 30, 1898, every place appropriated to the crew of a seagoing vessel of the United States, except a fishing vessel, yacht, or pilot boat, and all vessels under 200 tons register, shall have a space of not less than 72 cubic feet and not less than 12 square feet measured on the deck or floor of that place for each seaman or apprentice lodged therein: *Provided*, That any such seagoing sailing vessel built or rebuilt after June 30, 1898, shall have a space of not less than 100 cubic feet and not less than 16 square feet measured on the deck or floor of that space for each seaman or apprentice lodged therein. Such place shall be securely constructed, properly lighted, drained, heated, and ventilated, properly protected from weather and sea, and, as far as practicable, properly shut off and protected from the effluvia of cargo or bilge water.

"Fishing vessels, yachts, and pilot boats are hereby exempted from the provisions of section 1 of chapter 173 of the laws of 1895, entitled 'An Act to amend section 1 of chapter 306 of the laws of 1882, entitled 'An Act to provide for deductions from the gross tonnage of vessels of the United States,' so far as said section prescribes the amount of space which shall be appropriated to the crew and provides that said space shall be kept free from goods or stores not being the personal property of the crew in use during the voyage.

"And on and after June 30, 1898, every steamboat of the United States plying upon the Mississippi river or its tributaries shall furnish an appropriate place for the crew, which shall conform to the requirements of this section so far as they shall be applicable thereto by providing sleeping room in the engine room of the steamboats, properly protected from the cold, winds, and rain by means of suitable awnings or screens on either side of the guards or sides and forward, reaching from the boiler deck to the lower or main deck, under the direction and approval of the Supervising Inspector General of Steam Vessels, and shall be properly heated. Any failure to comply with this section shall subject the owner or owners to a penalty of \$500.

"*Sec. 3.* That section 4576 of the Revised Statutes be, and is hereby, amended to read as follows:

"*Sec. 4576.* The master of every vessel bound on a foreign voyage or engaged in the whale fishery shall exhibit the certified copy of the list of the crew to the first boarding officer at the first port of the United States at which he shall arrive on his return, and also produce the persons named therein to the boarding officer, whose duty it shall be to examine the men with such list and to report the same to the collector; and it shall be the duty of the collector at the port of arrival, where the same is different from the port from which the vessel originally sailed, to transmit a copy of the list reported to him to the collector of the port from which such vessel originally sailed. It shall be the duty to produce any person on the certified copy of the list

of the crew the master and owner shall be severally liable to a penalty of \$400, to be sued for, prosecuted, and disposed of in such manner as penalties and forfeitures which may be incurred for offenses against the laws relating to the collection of duties; but such penalties shall not be incurred on account of the master not producing to the first boarding officer any of the persons contained in the list who may have been discharged in a foreign country with the consent of the consul, vice-consul, commercial agent, or vice commercial agent there residing, certified in writing, under his hand and official seal, to be produced to the collector with the other persons composing the crew, nor on account of any such person dying or absconding or being forcibly impressed into other service, of which satisfactory proof shall also be exhibited to the collector.

"SEC. 4. That section 4541 of the Revised Statutes be, and is hereby, amended by striking out the words 'district judge for the district,' in the seventh line of said section, and substituting in place thereof the words 'circuit court of the circuit'; and that said section be, and is hereby, further amended by striking out the words 'district judge,' where they occur in the eleventh and twelfth lines of said section, and substituting in place thereof the words 'circuit court.'

"SEC. 5. That rule 11 of section 4233 of the Revised Statutes, relating to pilot boats, be amended by adding thereto a paragraph, as follows:

"Steam pilot boats shall, in addition to the mast-head light and green and red side lights required for ocean steam vessels, carry a red light hung vertically from 3 to 5 feet above the foremast head-light, for the purpose of distinguishing such steam pilot boats from other steam vessels."

"SEC. 6. That section 4542 of the Revised Statutes be, and is hereby, amended by adding thereto the words 'or where he died.'

"SEC. 7. That section 4545 of the Revised Statutes be, and is hereby, amended to read as follows:

"SEC. 4545. A circuit court, in its discretion, may at any time direct the sale of the whole or any part of the effects of a deceased seaman or apprentice, which it has received or may hereafter receive, and shall hold the proceeds of such sale as the wages of deceased seamen are held. When no claim to the wages or effects or proceeds of the sale of the effects of a deceased seaman or apprentice, received by a circuit court, is substantiated within six years after the receipt thereof by the court, it shall be in the absolute discretion of the court, if any subsequent claim is made, either to allow or refuse the same. Such courts shall, from time to time, pay any moneys arising from the unclaimed wages and effects of deceased seamen, which in their opinion is not necessary to retain for the purpose of satisfying claims, into the Treasury of the United States, and such moneys shall form a fund for, and be appropriated to, the relief of sick and disabled and destitute seamen belonging to the United States merchant-marine service."

"SEC. 8. That chapter 97 of the laws of 1895, entitled "An Act to amend an act entitled 'An Act to amend the laws relative to shipping commissioners,' approved Aug. 19, 1890," is amended by striking therefrom the word 'seventh' in the eighteenth line, and inserting the words 'and four thousand six hundred and two' in the thirty-fourth line after the words 'four thousand five hundred and fifty-four.'

"SEC. 9. That fees for the entry direct from a foreign port and for the clearance direct to a foreign port of a vessel navigating the waters of the northern, northeastern, and northwestern frontiers of the United States otherwise than by sea, pre-

scribed by section 4382 of the Revised Statutes, are abolished. Where such fees, under existing laws, constitute in whole or in part the compensation of a collector of customs, such officer shall hereafter receive a fixed sum for each year equal to the amount which he would have been entitled to receive as fees for such services during said year.

"SEC. 10. That section 4165 of the Revised Statutes be, and is hereby, amended to read as follows:

"SEC. 4165. A vessel registered pursuant to law, which by sale has become the property of a foreigner, shall be entitled to a new register upon afterward becoming American property, unless it has been enlarged or undergone change in build outside the United States."

"SEC. 11. That section 13 of chapter 344 of the laws of 1874 be, and is hereby, amended to read as follows:

"SEC. 13. That the Secretary of the Treasury may, upon application therefor, remit or mitigate any penalty provided for in this act, or discontinue any prosecution to recover the same, upon such terms as he, in his discretion, shall think proper, and shall have authority to ascertain the facts upon all such applications in such manner and under such regulations as he may think proper. All penalties herein provided may be sued for, prosecuted, recovered, and disposed of in the manner prescribed by section 4305 of the Revised Statutes."

"SEC. 12. That rule 14, rule 15 (a), (b), (c), rule 16, and rule 17 of section 4233 of the Revised Statutes be, and are hereby, amended to read as follows:

"Rule 14. The exhibition of any light on board of a vessel of war of the United States may be suspended whenever, in the opinion of the Secretary of the Navy, the commander in chief of a squadron, or the commander of a vessel acting singly, the special character of the service may require it. The exhibition of any light on board of a revenue cutter of the United States may be suspended whenever, in the opinion of the commander of the vessel, the special character of the service may require it."

"Rule 15. Whenever there is a fog or thick weather, whether by day or night, fog signals shall be used as follows: (a) Steam vessels under way shall sound a steam whistle placed before the funnel, not less than 8 feet from the deck, at intervals of not more than one minute. Steam vessels, when towing, shall sound three blasts of quick succession repeated at intervals of not more than one minute. (b) Sail vessels under way shall sound a fog horn at intervals of not more than one minute. (c) Steam vessels and sail vessels, when not under way, shall sound a bell at intervals of not more than two minutes."

"Rule 16. Risk of collision can, when circumstances permit, be ascertained by carefully watching the compass bearing of an approaching vessel. If the bearing does not appreciably change, such risk should be deemed to exist."

"Rule 17. When two sailing vessels are approaching one another so as to involve risk of collision, one of them shall keep out of the way of the other as follows, namely:

"(a) A vessel which is running free shall keep out of the way of a vessel which is closehauled."

"(b) A vessel which is closehauled on the port tack shall keep out of the way of a vessel which is closehauled on the starboard tack."

"(c) When both are running free with the wind on different sides, the vessel which has the wind on the port side shall keep out of the way of the other."

"(d) When both vessels are running free with the wind on the same side, the vessel which is to the windward shall keep out of the way of the vessel which is to the leeward."

"(e) A vessel which has the wind aft shall keep out of the way of the other vessel."

"SEC. 13. That section 4233 of the Revised Statutes be, and is hereby, amended by adding thereto:

"Rule 25. A sail vessel which is being overtaken by another vessel during the night shall show from her stern to such last-mentioned vessel a torch or a flare-up light."

"Rule 26. Nothing in these rules shall exonerate any ship, or the owner, or master, or crew thereof, from the consequences of any neglect to carry lights or signals, or of any neglect to keep a proper lookout, or of the neglect of any precaution which may be required by the ordinary practice of seamen or by the special circumstances of the case."

"SEC. 14. That the Secretary of the Treasury be, and he is hereby, authorized to direct the inspection of any foreign vessel admitted to American registry, its steam boilers, steam pipes, and appurtenances, and to direct the issue of the usual certificate of inspection, whether said boilers, steam pipes, and appurtenances are or are not constructed pursuant to the laws of the United States, or whether they are or are not constructed of iron stamped pursuant to said laws. The tests in the inspection of such boilers, steam pipes, and appurtenances shall be the same in all respects as to strength and safety as are required in the inspection of boilers constructed in the United States for marine purposes."

"SEC. 15. That section 2834 of the Revised Statutes be, and is hereby, amended by repealing the following words therein:

"The master of any vessel bound to any district in Connecticut, through or by the way of Sandy Hook, shall, before he passes the port of New York, and immediately after his arrival, deposit with the collector for the district of New York a true manifest of the cargo on board such vessel. The master of any vessel bound to the district of Burlington shall, before he passes the port of Philadelphia, and immediately after his arrival, deposit with the collector thereof a like manifest; and the collector shall, after registering the manifest, transmit the same, duly certified to have been so deposited, to the officer with whom the entries are to be made; and the"

"SEC. 16. That sections 2570, 2571, 2572, 2573, 2574, 2575, 2584, 2585, 2824, 2835, 2897, 4133, 4134, 4234, 4580, and 4590 of the Revised Statutes are repealed."

"SEC. 17. That section 2797 of the Revised Statutes be, and is hereby, amended by adding thereto the following words:

"Sea stores and the legitimate equipment of vessels belonging to regular lines plying between foreign ports and the United States delayed in port for any cause may be transferred in such port of the United States, under the supervision of the customs officers, from one vessel to another vessel of the same owner without payment of duties, but duties must be paid on such stores or equipments landed for consumption except American products."

"SEC. 18. That section 5347 be amended to read:

"SEC. 5347. Every master or other officer of an American vessel on the high seas or on any other waters within the admiralty and maritime jurisdiction of the United States who, without justifiable cause, beats, wounds, or imprisons any of the crew of such vessel, or withholds from them suitable food and nourishment, or inflicts upon them any cruel and unusual punishment, shall be punished by a fine of not more than \$1,000, or by imprisonment not more than five years, or by both."

"Nothing herein contained shall be construed to repeal or modify section 4611 of the Revised Statutes."

"SEC. 19. That Article VII of section 4511 of the Revised Statutes be, and is hereby, amended to read:

"Seventh. Any regulations as to conduct on board and as to fines, short allowances of provisions, or other lawful punishments for misconduct, which may be sanctioned by Congress or authorized by the Secretary of the Treasury not contrary to or not otherwise provided for by law, which the parties agree to adopt."

"SEC. 20. That this act shall take effect July 1, 1897."

The bill as it originally passed the Senate made no mention of section 4611 of the Revised Statutes, which was a law enacted in 1850 to abolish flogging in the American merchant marine, and this omission was assumed by some friends of the sailors as virtually a restoration of the practice of flogging. As a consequence, there was some harsh criticism of the committee that reported the Senate bill; and suspicion still lingered on the last day of the session, for Mr. Allen, of Nebraska, on the reading of the conference report, said:

"I should like to have the section of the report read which applies to seamen, to see whether it contains any of the flogging features that were contained in the bill some time ago."

Mr. Frye, of Maine, said in answer: "Let me read it to the Senator, instead of the clerk. The existing law is this:

"SEC. 5347. Every master or other officer of any American vessel on the high seas, or on any other waters within the admiralty and maritime jurisdiction of the United States, who, from malice, hatred, or revenge, and without justifiable cause, beats, wounds, or imprisons any of the crew of such vessel, or withholds from them suitable food and nourishment, or inflicts upon them any cruel and unusual punishment, shall be punished by a fine of not more than \$1,000, or by imprisonment not more than five years, or by both."

"The courts held that those words 'malice, hatred, or revenge' imposed upon the beaten sailor the duty of proving not only that the beating was without justifiable cause, but that it was from malice or hatred or for the purpose of revenge. The Senate Committee on Commerce believed that to be an unjust burden on the sailor, and therefore they simply strike out of this law the words 'malice, hatred, or revenge.'"

"I have been vicariously suffering for the Committee on Commerce, and a great deal of abuse has been heaped upon my unfortunate head within the last two months, the charge being made that I had restored flogging on American merchant ships. How anybody could have believed that is beyond my comprehension. The man who did must have been a fool or insane; and yet I was blackguarded in one or two great papers of the country as 'that brutal Senator Frye; that man who had restored flogging to the merchant marine.' Yet everything that that 'brutal man' had done had been done by the Committee on Commerce, and has been done to save the sailors of this country from being compelled, if they were beaten, to prove not only that it was without justifiable cause, but that it was from malice or hatred or revenge."

"I never undertook to defend myself in the United States Senate, as I might have done, from those charges. I never did defend myself in Congress since I have been here. I regarded it as furnishing amusement to ignorance and to incapacity, and as doing me no possible harm. Now, the committee, paying the same consideration to ignorance that I did by keeping still, has in conference added to this section these words:

"But nothing herein contained shall be con-

strued to repeal or modify section 4611 of the Revised Statutes."

"Which those wise gentlemen never had read, which was passed in 1850, and which says, 'Flogging on board of vessels of commerce is hereby prohibited.' In order to relieve those wise men, we have consented that an amendment shall be added to this section that we do not intend to restore flogging in the merchant marine by repealing section 4611. I trust that that will be entirely satisfactory to any sailor, no matter how crazy he may be."

As to what may be justifiable causes for assaulting a sailor the following colloquy arose:

Mr. Allen: "I should like to know from the Senator from Maine, who is familiar with these matters, especially matters of commerce, what circumstances will justify the assault of a sailor, either on shore or on a vessel?"

Mr. Frye: "Oh, Mr. President, there are any quantity of circumstances that would justify it. If a sailor with a sheath knife came at the captain, it would be his duty to knock him down; if he was on duty at the wheel and undertook to cast away the ship, or run it on a rock, it would be the duty of the captain to deprive him of the power of doing so. There are any quantity of circumstances."

Mr. Allen: "I understand that quite well; but I want to know if there are any circumstances, aside from the mere fact that it occurred upon a vessel which may be thrown upon the rocks, or cast aside from its course, and so forth—whether there are any circumstances on board a vessel that will justify an assault upon a sailor that would not justify an assault on land by one private citizen upon another?"

Mr. Frye: "Yes, I think so; because if a gale of wind was seen approaching and the captain of the ship should order the sailors to reef sails, and they refused, when there are lives in his charge and when there is an immense amount of property endangered, I have no doubt the captain would be justified in making an assault upon a sailor who refused."

The Congress also passed and the President approved a law for the inspection of small craft kept for hire, as follows:

"Be it enacted, etc., That all vessels of above 15 tons burden, carrying freight or passengers for hire, propelled by gas, fluid, naphtha, or electric motors, shall be, and are hereby, made subject to all the provisions of section 4426 of the Revised Statutes of the United States, relating to the inspection of hulls and boilers and requiring engineers and pilots; and all vessels so propelled, without regard to tonnage or use, shall be subject to the provisions of section 4412 of the Revised Statutes of the United States, relating to the regulation of steam vessels in passing each other; and to so much of sections 4233 and 4234 of the Revised Statutes, relating to lights, fog signals, steering, and sailing rules, as the Board of Supervising Inspectors shall, by their regulations, deem applicable and practicable for their safe navigation."

A measure entitled "An Act for the protection of American yacht owners and shipbuilders" was passed by the Congress, and became a law without the approval of the President. It is designed to prevent Americans who become members of foreign yacht clubs from having vessels built abroad, and yet escaping the disabilities of owners of other foreign-built vessels.

A bill amending the laws relating to American seamen passed the House, and in the Senate a substitute was proposed which contained the following clause:

"That section 4522 of the Revised Statutes be, and is hereby, amended so as to read as follows:

"SEC. 4522. At the foot of every such contract to ship upon such a vessel of the burden of 50 tons or upward there shall be a memorandum in writing of the day and the hour when such seaman who shipped and subscribed shall render himself on board to begin the voyage agreed upon. If any seaman shall neglect to render himself on board the vessel for which he has shipped at the time mentioned in such memorandum without giving twenty-four hours' notice of his inability to do so, and if the master of the vessel shall, on the day in which such neglect happened, make an entry in the log book of such vessel of the name of such seaman, and shall in like manner note the time that he so neglected to render himself after the time appointed, then every such seaman shall forfeit, for every hour which he shall so neglect to render himself, one half of one day's pay, according to the rate of wages agreed upon, to be deducted out of his wages. If any such seaman shall wholly neglect to render himself on board of such vessel, or having rendered himself on board shall afterward desert, he shall forfeit all of the wages or emoluments which he has then earned; and, also, in the discretion of the court, he shall be liable to imprisonment for not more than one month."

The forfeit of wages and the summary imprisonment are the new features in the statute, and Mr. Frye, of Maine, said in defense of the policy of the amendment:

"I desire to call the attention of the Senate to this matter. It is said that foreign countries have nothing of this kind. Great Britain has a law to-day that if a sailor signs the papers of a ship and then declines to serve on that ship the master may call on any policeman who is in view or who can be found to take the sailor and carry him on board the ship, put him in irons, and keep him there until the ship sails.

"What are ships going to do without some such provision as this bill makes? You can not run a ship as you can a coach; you can not run a ship as you can a railroad. Here is a ship loaded for sea, the crew engaged, the papers signed. She is subject to a demurrage of hundreds of dollars a day for every day she is detained. A sailor having been brought and put on board of that ship, the next morning, without the slightest cause, leaves, and thus the ship is left without the requisite crew, and she is obliged to pay demurrage for every day she is detained. A storm may arise, and she may be delayed by head winds for a week, a fortnight, or three weeks. There is nothing of the kind about a coach; there is nothing of the kind about a railroad. I wish to say right here that I have had something to do with these sailors. There is a sailors' union in California which has had its attorney here for the last six years, and he is here now—a sailor. There is a sailors' union in Philadelphia; there is a sailors' unions in New York. If Senators suppose that the sailors are not being taken care of, they are entirely mistaken. There is not a port where there is not a sailors' lawyer. The sailor has every advantage of the ship and every advantage of the shipmaster in any port into which a vessel may go. The ships are entitled to some consideration. They carry our commerce.

"When the bill was pending two Congresses ago in the first place, I had conferences with these sailors and the sailors' union. They lasted over three or four days; Gov. Dingley was with me; and we finally drew up that which seemed to satisfy the sailor from California, and it was enacted into law. But there is no satisfying them without giving them the earth; you can not do it.

"They still cry 'Give!' after we have made them all these concessions. Taking this entire Congress, this bill has been under consideration for six months, and the sailors have had hearings over and over again in our committee, and the ship-owners have had their hearings. Finally ship-owners and sailors undertook to get together and see if there could not be some agreement by which the condition of the sailor might be ameliorated. There is not a line in that bill, except this particular one, that is not for the amelioration of the condition of the sailor—not one. Wherever there was imprisonment before, and it was compulsory on the court to imprison, it has been made in the discretion of the court, and wherever the imprisonment was for four months before it is two months now, and where it was six months before it is three months now in that bill. In that bill there is provided a *menu* for these sailors almost equal to that which any hotel in the city of Washington furnishes. In every single item in that bill, except this single one, there is what the sailors have demanded, what they have prayed for, and what has been granted by the ship-owners and by our committee, except as to the single matter of what they call 'crimping.'"

None the less the bill failed in the Senate, as there was a decided reluctance on the part of some of the Senators to authorize arbitrary punishment to enforce what they considered a civil contract.

The Atlantic and Pacific Railroad Company.

—The Senate passed a brief bill providing that whenever a sale of the road, equipment, lands, franchises, and privileges of this company are sold through mortgage foreclosure, the purchasers and their associates shall succeed to all the rights, powers, privileges, grants, and franchises, including the franchise to be a corporation given to the original corporation.

In the House of Representatives the Committee on Pacific Railroads reported a substitute with a proviso limiting the issue of stock by the new company and another declaring that the rights of the United States to enforce forfeiture of lands and the vested rights of purchasers and settlers are not to be affected.

Mr. McRae, of Arkansas, representing those who considered the measure as a surreptitious renewal of forfeited grants and trusts carelessly, if not dishonestly administered, proposed a substitute, with many other safeguards embodied in it; but the House took up the committee measure, amended it in several important respects, and passed it.

The Atlantic and Pacific Railroad Company was created by act of July 27, 1866, to construct, maintain, and operate a line of railroad and telegraph, from Springfield, Mo., across Indian, New Mexico, and Arizona Territories, and California to the Pacific coast. To aid in its construction a heavy subsidy in public lands was given. The issuance of \$100,000,000 in capital stock was authorized, but popular subscription was slow, and the company secured from Congress, under the act of April 20, 1871, the authority to mortgage its road, equipment, lands, franchises, privileges, and other rights and property. The line from Springfield to Indian Territory was built out of the proceeds of the sale of these mortgage bonds, but it was sold some years ago on default and is now part of the St. Louis and San Francisco Railroad. The line through Indian Territory to Albuquerque, New Mexico, and the line thence into California were constructed and each was separately mortgaged; and foreclosure proceedings were pending on account of default. The land grant was conditioned on the completion of the road by July 4, 1878; but at that date only about 125 miles of the line were constructed; and July 6, 1886,

Congress declared a forfeiture of lands along the uncompleted portions of the road.

Mr. Powers, of Vermont, in advocating the measure said:

"Now, Mr. Speaker, as the report states, this bill simply provides that the mortgage bondholders of the Atlantic and Pacific Railroad Company may reorganize into a corporation—in other words, may have the right to be a corporation. The necessity for this bill arises from the fact that the Supreme Court in two cases has decided that the mortgage of a railroad company, together with its franchises, does not carry the right to be a corporation. Evidently connected with this original company supposed that the right to mortgage, given them by Congress in 1871, which in terms embraced the franchises, was broad enough to enable them, on a foreclosure sale, to organize as a corporation; but the Supreme Court says not; hence the necessity for the passage of this bill.

"The House will remember that this company was started in 1866, was given a mammoth land grant of 42,000,000 acres, and that in 1871 it became necessary for the company, in order to build its road, to issue a mortgage. That mortgage was issued, covering the property and franchises of the road, but lacking this essential, vital point—the franchise to be a corporation.

"Now, when this question was before the House on a former occasion it was said that this land grant was a monstrous land grant, that it was fraudulent, that great wrong was done to the Government in the amount of land granted to the railroad. Concede that to be true for the purposes of this argument; what has that to do with the pending question? Congress enacted the law. It became a part of the rights of that company to take those lands; but it turns out upon investigation that the lands are in the arid region; they are good for nothing. The company itself, out of the 42,000,000 acres, has only succeeded in selling 700,000 and odd acres. A great proportion of the land has been forfeited to the Government, and a suit is now pending, and is up for argument in court to-day, to determine the right of the Government to forfeit the balance.

"But be that as it may, this is the practical question that is presented to the House: This company, however fraudulent it may have been, however disproportionate its land grant may have been to its right to build a railroad to the California coast, nevertheless that wrongdoing is not to be imputed to the applicants for this charter. The applicants for this charter are the innocent parties who advanced their money upon a mortgage of this road. That money built the road. It could not have been built otherwise. As the report shows, it was supposed that private subscriptions along the line of the road would be ample to build the road, but those hopes proved to be delusive. The company were obliged to borrow money. They did borrow it, and innocent parties, who had nothing whatever to do with any wrongdoing connected with the making of the land grant, advanced their money and the road was completed.

"Now, it is highly improper to visit upon these innocent parties any wrongdoing that may have been practised by the original promoters of the enterprise. There is no justice or propriety in that. These mortgage bonds are held by guardians, by trustees, by women, and by other parties, and the proposition of the gentleman from Arkansas is that they may be visited with the consequences and be made to suffer for that former wrongdoing, for which they are in no wise responsible. But now, Mr. Speaker, there was not any wrongdoing. The gift on the part of the Government of 42,000,000 acres of land did not amount to anything in the way of

As I have already said, they have sold only 708,000 acres out of the 42,000,000 acres given to them, for the simple reason that you might turn a razorback pig loose on the land in that country and it could not get a living."

In opposition to the measure Mr. McRae, of Arkansas, said, when proposing his substitute:

"Mr. Speaker, as a general proposition I am opposed to the granting of Federal charters at all. I think such should be done by the States. In this case it does not appear to me that there is any necessity for it. Beyond all question the bill as presented should not pass unless amended in several particulars.

"The original act of July 27, 1866, granted to the Atlantic and Pacific Railroad Company 42,000,000 acres of land, and authorized 175 private individuals, named in the granting act, scattered all the way from Maine to California, upon the conditions that they should build something over 2,000 miles of railroad from Springfield, Mo., to the Pacific Ocean, before July 4, 1878. That is to say, that before the title finally passed from the Government this construction was to be fully completed. Within the time fixed by the granting act for the completion of the entire road they built only 125 miles of it. They came to Congress and asked Congress to give them the right to mortgage the road. That authority brought them no money. They then asked and obtained authority to mortgage the lands, franchises, privileges, and other rights and property. They executed the mortgages, but, as I have said, they completed only 125 miles of the road within the time fixed in the granting act.

"The mortgagees deliberately, with the full knowledge of the terms of the grant as to the time prescribed for the completion of the road, made the mortgages due at a later day. There was inserted in the act authorizing the mortgage a provision that any forfeiture should extend only to as much thereof as shall be continuous with or appertaining to that part of said road which shall have been constructed at the time of the foreclosure of said mortgage. These mortgagees, at every meeting of the committee when the forfeiture bill was being considered, and when Congress sought to forfeit the grant, contended that Congress had no authority to do so under the law. The act of July 6, 1886, was passed with the understanding that it would restore to the public domain 10,795,480 acres of land. And yet in the face of the record they have made, after they have violated every condition imposed on them by the granting act, they still deny the power to forfeit. Congress, on the 6th day of July, 1886, declared a forfeiture of all lands adjacent to and continuous with the uncompleted portions of the road at that time, and attempted in this manner to exercise its sovereign right and power to restore to the public domain something over 10,000,000 acres of the lands granted. These mortgagees and this faithless corporation in the courts of law have ever since been fighting the Government and the settlers, and are to-day contesting in the Supreme Court of the United States for these lands upon the same old contention that the Congress of the United States had no authority to declare the forfeiture. And yet the mortgagees of this corporation come to us with its record of broken pledges and asks that we give them the same rights and powers and privileges granted by the grant of July 27, 1866. Thirty years have elapsed since the grant was made, and yet more than one half of the road is unconstructed, the corporation bankrupted and now in the hands of a receiver, being unable to pay interest on its bonds. Across the great Mojave desert, where it was expected that by this grant we would secure railroad

facilities, no road has yet been constructed, and there is but little prospect of any by this concern.

"Now, if any relief is to be given to these debtors who come here as mortgagees—and I will grant for the sake of argument that some of them have acted honestly and in good faith in the investment of their money—we should see to it (1) that no relief is given to the men who acquired this charter and afterward violated every promise made by them and broke every condition imposed upon them by the grant; (2) that the terms of the forfeiture act of July 6, 1886, shall be first accepted by the new corporation as a condition precedent, and that this act shall not take effect until they reconvey the lands thus forfeited; (3) that the settlers shall have the lands which have been earned and not sold at the minimum Government price of \$1.25 per acre, and those who have purchased fully protected in their titles; (4) that the *bona fide* debts due for work, labor, material, etc., shall be paid; and (5) the stock should be limited to the actual value of the road, so as to prevent the watering of the stock, and that the interest shall not exceed 4 per cent. The substitute which I have offered will secure all of this. If it is not adopted, I hope amendments will be that will secure the same things.

"Mr. Speaker, shall we, by breathing into this corporation a new life, permit it to repudiate the honest debts of those who have performed labor for it? I have provided that all the debts, except those due to the old Atchison, Topeka and Santa Fé and to the St. Louis and San Francisco Railroad Companies, shall be paid. As for these railroad corporations, who have wrecked the Atlantic and Pacific and themselves and reorganized, I have no concern. They have second mortgages, and as they have been relieved of the payment of a part of their debts by similar reorganization, so if Congress sees fit to give the Atlantic and Pacific relief against them, I have no objection; but as to the laborer and the mechanic and those who have legitimate claims growing out of the operation of the road, I say it would be legalized repudiation to permit these mortgage creditors to defeat the payment of their debts, or be preferred to them, even though they may have originally invested their money in good faith. So I have endeavored to provide for the protection of these men. I think that the settlers along the line of the road should be protected in their purchases already made, and also by reducing the price for which these lands may be sold, so that the price shall be no more than the Government price. These lands have been withheld from settlement for thirty years. The act of forfeiture of 1886 reduced the Government price of land along this grant to \$1.25 an acre, and I think the railroad lands should not exceed that sum. Let us say to this corporation: 'If you are to be reorganized under authority from Congress, you shall first accept as a condition precedent the terms imposed by the forfeiture act of 1886; and you shall sell the lands you have earned or acquired to actual settlers at the price at which the Government sells its public lands.'

"Why should there be any objection to my proposition to limit the stock to be issued by this company as reorganized to the actual amount due upon mortgages and other just indebtedness? Why should we give this new corporation authority from the Congress of the United States to do what the old one did—water its stock and enrich its stockholders at the expense of the Government and the people? The old incorporators contributed nothing to the building of this road. These do not propose to contribute anything to it. I question whether the old set honestly and in good faith appropriated the money they borrowed from the

bondholders. The most that ought to be done under any circumstances is to protect the honest bonded debt; but so far as the outstanding stock is concerned, I appeal to Congress to study the history of this grant before authorizing a reissue of any part of it with a charter to go forth and ship-pers and settlers.

"While I dislike to vote for a charter to reorganize or organize a Federal corporation by authority of the Congress of the United States, I am willing to do so in this case if gentlemen will accept these conditions; but I want it understood that the forfeiture which was declared ten years ago must be made a condition precedent to the reorganization. They shall not, with my consent, stand in one branch of this Government denying the right of Congress to make a forfeiture, and in the other branch asking permission from Congress to live."

These arguments are given as presenting the adverse views of the measure and marking the limits within which the discussion of it ranged.

The Senate nonconcurred in the House amendments, and a conference committee was appointed and made a report which sacrificed the amendment requiring the new company as a condition precedent to surrender any claim to ownership of land declared forfeited by Congress, and that concession the House refused to approve. A second conference resulted in a report retaining that amendment, which had lost its importance, in view of the fact that the Supreme Court had in the interim decided in favor of the authority of Congress to declare the forfeiture. The following is the final form of the measure:

"*Be it enacted etc.*, That whenever any mortgage made by the Atlantic and Pacific Railroad Company under and by virtue of acts of Congress is foreclosed in any court of the United States, or of any State or Territory thereof, and any sale of the road, equipment, lands, franchises, privileges, and other rights and property covered by said mortgage is made under a decree or decrees of such courts, the purchaser at any such sale or sales, and their associates or assigns, shall constitute a new company, which shall have and shall be entitled to hold and possess the franchises and property so sold, and to exercise the same rights, powers, privileges, grants, and franchises, including the franchise to be a corporation, granted by the act of Congress approved July 27, 1866, incorporating the Atlantic and Pacific Railroad Company, and by acts amendatory thereof and supplemental thereto, which were owned and possessed by said Atlantic and Pacific Railroad Company, or said mortgagees at the time of such decree of foreclosure; and the incorporation as hereby provided shall be completed and become effective whenever the said purchasers and their associates or assigns shall file with the Secretary of the Interior a certificate of incorporation hereunder, duly acknowledged, specifying the name of such new corporation, its president, and the names of its directors, the amount of its proposed capital stock and bonds, together with certified copy of the decree or decrees ratifying such sale.

"But such new company shall be subject to all the obligations and duties to the United States to which said Atlantic and Pacific Railroad Company was subject under its charter or act of incorporation; and nothing in this act shall be held to deprive the United States of any right or remedy they may at any time have had against said Atlantic and Pacific Railroad Company; but nothing in this act shall make such purchasers and their associates or such new corporation liable for any debts or claims or contracts of the old corporation except all debts, demands, and liabilities which were due or owing by the old company, which were contracted, accrued,

or were incurred, or are due or owing for tickets and freight balances, or for wages, work, labor, materials, machinery, fixtures, and supplies of every kind and character, done, performed, or furnished in the repair, equipment, operation, or extension of said road, and its branches so purchased, and all liabilities incurred by said old company in the transportation of freight and passengers thereon, including damages for injuries to employees or other persons, and to property, and which debts, demands, and liabilities have accrued or upon which suit had been brought or was pending, or judgment rendered, within twelve months prior to the appointment of a receiver or receivers in the foreclosure proceeding or since the appointment of any such receiver, but such liabilities shall not include any liabilities to other railroad companies except for tickets and freight balances.

"The capital stock of the corporation herein authorized shall be divided into shares each of the par value of \$100, and shall not exceed the amount of the mortgage debt due and unpaid at the time of the decree of foreclosure: *Provided*, That additional stock and bonds may be issued by the corporation upon the payment into its treasury thereof the full par value thereof in cash. No stock shall be issued until the Secretary of the Interior shall approve its issue and certify that it is issued in conformity to the provisions of this act. The total stock issued under the provisions of this act shall not exceed \$100,000,000.

"*Provided further*, That nothing herein contained shall be construed as making any additional grant of lands or other franchises to such successor corporation, or as a waiver of any rights of the United States now existing to enforce any forfeiture of lands heretofore granted to the said Atlantic and Pacific Railroad Company, or as in any manner affecting the vested rights of any settler or settlers on any of the lands heretofore granted to the Atlantic and Pacific Railroad Company or of any purchaser or purchasers of said lands from said company.

"*Provided further*, That as a condition precedent to reorganization the purchasers of the railroad property and their associates shall relinquish in writing and convey to the United States (by a proper deed or instrument to be filed with and approved by the Secretary of the Interior within six months after the passage of this act and before the act shall take effect) all claim, right, title, and interest to all lands granted to the Atlantic and Pacific Railroad Company embraced within both the granted and indemnity limits which were adjacent to and continuous with the uncompleted portions of the road on the 6th day of July, 1886.

"*And provided further*, That in every case of failure of the title to any lands conveyed or contracted to be sold by said Atlantic and Pacific Railroad Company to any bona fide settler and occupant in a tract of 640 acres or less, any and all rights of such purchaser or his assigns, in respect of such land, or in respect of the failure of such title, or in respect to the liability of said Atlantic and Pacific Railroad Company on any such contract, shall survive and may be enforced against such successor company with the same force and effect and in the same manner as against the Atlantic and Pacific Railroad Company; and such successor company, upon making compensation for such loss of any title or failure to comply with the conditions of such land contracts, shall be subrogated to the rights of such purchaser in respect of the lands for which such compensation shall have been made.

"*Provided further*, That in case any uncompleted contracts for the purchase of lands shall be pending at the time of such foreclosure sale, such new company shall, upon payment to it of any unpaid bal-

ance of purchase money for such land at the time provided in such contracts for the sale thereof, convey and release to the holders of such contracts all its title, interest, and estate in and to the land embraced in such contracts."

"SEC. 2. That Congress shall at all times have the power to alter, amend, or repeal this act."

"SEC. 3. Where the line of such railway is now located within the limits of any State, or where such line is now located within a Territory which may hereafter become a State, such State, or such Territory when it shall become a State, shall be empowered to require such corporation to become incorporated within such State or States as may be provided by the laws thereof."

The President approved the measure March 3.

International Money Conference.—The Congress passed and the President approved the following measure "to provide for the representation of the United States by commissioners at any international money conference hereafter to be called:

"*Be it enacted, etc.*, That whenever after March 4, 1897, the President of the United States shall determine that the United States should be represented at any international conference called by the United States or any other country with a view to securing by international agreement a fixity of relative value between gold and silver as money by means of a common ratio between these metals, with free mintage at such ratio, he is hereby authorized to appoint five or more commissioners to such international conference; and for compensation of said commissioners, and for all reasonable expenses connected therewith, to be approved by the Secretary of State, including the proportion to be paid by the United States of the joint expenses of any such conference, the sum of \$100,000, or so much thereof as may be necessary, is hereby appropriated.

"SEC. 2. That the President of the United States is hereby authorized, in the name of the Government of the United States, to call, in his discretion, such international conference, to assemble at such point as may be agreed upon.

"And he is further authorized, if in his judgment the purpose specified in the first section hereof can thus be better attained, to appoint one or more special commissioners or envoys to such of the nations of Europe as he may designate to seek by diplomatic negotiations an international agreement for the purpose specified in the first section hereof. And in case of such appointment so much of the appropriation herein made as shall be necessary shall be available for the proper expenses and compensation of such commissioners or envoys."

It may be worth while to quote from speeches made by three Senators representing the various views on the measure.

Mr. Chandler, of New Hampshire, said:

"Mr. President, this bill represents a new movement beginning in the United States for the establishment of bimetalism, the unlimited coinage of silver and gold as standard money.

"The provisions of the bill are in the form desired by its friends; substantially in the language of three previous authorizations under which United States delegates were appointed to international monetary conferences, and of one under which no action was taken.

"It simply authorizes the coming President to appoint delegates to any conference which may be called by the United States or any other nation, and provides for paying their expenses.

"It does not compel the President to initiate an international conference, whether the time has arrived and due preparations have been made for it or not; and it is not desirable that such compul-

sion should be ordered. The responsibility for action or nonaction will be his, and there need be no desire to take it from him in view of his utterance upon accepting the nomination of his party, namely:

"The Republican party has declared in favor of an international agreement, and if elected President it will be my duty to employ all proper means to promote it."

"The bill does not name the place where a conference must be held, but leaves that question to be settled according to the preferences of the nations which are to participate in it, and to the convenience of the greater number of the delegates. It would be exceedingly unwise to absolutely require that the conference shall be held in the United States.

"The bill does not undertake to declare what the action of this Government will be in case the conference shall fail to establish bimetalism. To insert a legislative provision that in such an event the United States alone will proceed to the free coinage of silver would necessarily prevent a successful outcome of the conference if one ensues, and, moreover, would certainly defeat the passage of this bill through both Houses and its signature by the President. It would be as complete a rejection of the bill as would be a vote of the Senate to indefinitely postpone it, and the responsibility for the first defeat of the new movement for bimetalism would fatally rest upon those who claim to be the special champions of silver.

"Mr. President, this bill for an international bimetallic conference has been deliberately presented in a body a majority of whose members are well known to be in favor of the free coinage of silver by the United States independently of other nations, and who believe that no successful result will come from the conference. But it is presented to them in the belief and after the assurance that they are not unwilling to allow the experiment to be again tried, under favorable auspices, and with a universal hope that it may secure the adoption of a system of bimetalism by the leading commercial nations of the world."

Mr. Stewart of Nevada said:

"There are many grave objections to international money which ought to make us hesitate before we enter into any compact with the world to have international money. In the first place, if we had an international money that was legal tender throughout the world our business would be subject to the fluctuations and changes of every country of the world. A business man would not only have to calculate about the business of his own country, but he would have to know the world in order to guard himself against fluctuations and disturbances which might occur anywhere. The idea that commerce can not be carried on without international money is against the experience of mankind. International money never has existed, to my knowledge, except in one instance. The Latin Union in 1865 formed a compact whereby the money of France, Italy, Greece, Belgium, and Switzerland should be a legal tender throughout that combination. But those were small countries, dependent upon France and under France's protection at the time. That is the only instance I know of international money.

"Money is essentially domestic. It is a great misfortune if it has to be exported and sold in other countries. We do not want to export our money. We should not make an effort to have a kind of money that can be exported as such. When we export our money we disturb our own business. We might as well export our tools and attempt to carry on farming and other vocations. If you export

money you take away the tools of commerce and destroy the prosperity of our country.

"The idea of an international conference to establish an international money is against experience, and will cause great inconvenience to every nation involved in the complication. We should avoid entangling alliances, if possible. This would be the worst; and we see what grows out of it. The London press say: 'If we make a bargain with you in regard to finances, you must make a bargain with us in regard to the tariff.' Thereby they assume to have jurisdiction in this country, to control our domestic affairs. Shall we surrender it? Shall we surrender to other countries that jurisdiction which we think so important? The Constitution enjoins upon Congress the duty 'to coin money, regulate the value thereof, and of foreign coin.' Shall we give that up and say we have no right to coin money according to the Constitution? We exercised that right for over seventy years with great benefit to our country, and no inconvenience to anybody.

"So I am opposed to international money. I am opposed to allowing any other country to participate in our domestic affairs. I am in favor of the United States furnishing to the people an adequate supply of money. Individuals can not supply money. If they attempt it it is a criminal offense. The Government has a complete monopoly. It is a part of the sovereignty of the Government to exercise that monopoly; and here we are going to Europe to ascertain whether we can legislate for the people of the United States. We are going to Europe, to our creditors, to the creditor nations of Europe, to the money powers of Europe, to see what measure they will mete out to us—what amount of money it is to their interest for us to have. The influence of Europe has brought this country to a sad condition."

Mr. Vilas, of Wisconsin, said:

"In what it says, still more in its implications, the bill is worse than useless—it is highly vicious. It is another of the ambiguous and timid utterances, of the projects, illusory—perhaps it is not too much to say deceitful—by which those of our countrymen who put faith in the declarations of Congress, as guided by wisdom, are perversely taught misconception of the true principles of government, of finance, and commerce.

"I do not charge that the scheme is not supported with sincerity, nor that, in fact, no conference is purposed to be held, or, if held, no practical result is anticipated—though for this there might be grounds of suspicion, as the Senator from California intimated yesterday. I take it rather as being what its words indicate, and there find it worse in effect than if merely insincere.

"It proffers again to the public as sound and wise the theory that bimetallicism, in the sense that a stable, practicable, and useful standard of value may be compounded of the two metals, gold and silver, both enjoying free and unlimited coinage at an arbitrary ratio, if only many nations will try it together instead of ours alone. In that it defies the teaching of history, the advice of experience and experienced men, and the deductions of sound reason.

"No such bimetallicism has ever existed in fact: in no country of the world does it exist now. Always and everywhere the concurrent unlimited coinage of the two metals, at any ratio, has resulted in the involuntary, unconscious, but inevitable fixation, for the time being, of one or the other metal as the standard, the vain though constant pursuit of an unattainable adjustment of relation between two different and contending standards at the same time by continual shifts of legislation, always ac-

companied by instability of values of the current coins, profitable only to money changers, but inflicting distress on business, and especial injury on those who depend on their labor for life and its enjoyments.

"The pretense that any such system of bimetallicism as created the standard out of both metals so that the value of both became necessary components of it, has ever had existence in the world is overwhelmed by the most trustworthy historical researches and must be consigned to the limbo where the ghosts of witchcraft, astrology, demonology, and kindred superstitions have been driven by the advancing intelligence and wisdom of mankind.

"It would matter little if it were granted to have once had some footing on earth, for it has none now. As I said, no country furnishes example of it. Some base their reckoning of business on silver coins; some on gold; but none on a bimetallic standard. If such ever existed, then it has disappeared; and let him who would demand its resurrection confront the experienced progress of human intelligence.

"In either aspect the pursuit of a bimetallic standard of such a character is as idle as would be human effort to divert the Gulf Stream or warm the climate of the poles.

"But still more this bill implies to the public mind, and the inference is certain that such a standard of value is far better and more desirable than the present. It is complete acknowledgment of the fundamental assumption of the Bryan campaign that a gold standard of monetary measurement, however freely silver may be used within the sphere of its practical usefulness, is wrong, not right, a false, not a true, standard, the product of evil law, not of just and natural law, an injury done society by human error which can be in some way redressed, and therefore ought to be. And it fairly leads to the recent issue that but for the wicked resistance of other countries the grievous wrong might be righted and the woes of mankind, here and elsewhere, vastly alleviated. Sir, no wonder men listened to the siren tones that lured them toward this fancied blessing and said, 'Let us try it alone, let us be free and independent, let us have the boon of prosperity, without the consent of any other nation on earth.'"

"If they had been right in their basis, which this vicious and misleading bill now implies, they were right in this insistence, for it is assuredly a truth, sir, in my poor opinion, that any people under the sun may pursue alone the sound principles of finance, commerce, business, and good government, without any exception whatever of a single principle among all that rule those subjects, independently of other nations, and be gainers, not losers, by their faithful adherence to them. Not always to the full extent that co-operation with others would insure, but always to advantage and benefit far beyond any attainable by not pursuing them.

"Why, then, if the free coinage of both metals at an arbitrary ratio be a principle of finance or commerce valuable to many nations together, it is not, like all sound principles of finance and commerce, helpful to the nation which pursues it alone? Sir, that appears to me a question which the average common sense of man does not find answered by the refinements and mysticism which proffer all the benefits of principle only to some hopeless application of it; and it can not be thus answered to any sound judgment. 'The hills are green far away' is the sententious Irish saying that dispatches such fantastic theories."

Inspection of Tea.—The Senate passed Feb. 23, 1897, a bill to prevent the importation of impure and unwholesome tea; the House passed the meas-

use the following day, and the President approved it March 2. The act is as follows:

"Be it enacted, etc., That from and after May 1, 1897, it shall be unlawful for any person or persons or corporation to import or bring into the United States any merchandise as tea which is inferior in purity, quality, and fitness for consumption to the standards provided in section 3 of this act, and the importation of all such merchandise is hereby prohibited.

"SEC. 2. That immediately after the passage of this act, and on or before Feb. 15 of each year thereafter, the Secretary of the Treasury shall appoint a board, to consist of seven members, each of whom shall be an expert in teas, and who shall prepare and submit to him standard samples of tea; that the persons so appointed shall be at all times subject to removal by the said Secretary, and shall serve for the term of one year; that vacancies in the said board occurring by removal, death, resignation, or any other cause shall be forthwith filled by the Secretary of the Treasury by appointment, such appointees to hold for the unexpired term; that said board shall appoint a presiding officer, who shall be the medium of all communications to or from such board; that each member of said board shall receive as compensation the sum of \$50 per annum, which, together with all necessary expenses while engaged upon the duty herein provided, shall be paid out of the appropriation for 'expenses of collecting the revenue from customs.'

"SEC. 3. That the Secretary of the Treasury, upon the recommendation of the said board, shall fix and establish uniform standards of purity, quality, and fitness for consumption of all kinds of teas imported into the United States, and shall procure and deposit in the customhouses of the ports of New York, Chicago, San Francisco, and such other ports as he may determine, duplicate samples of such standards; that said Secretary shall procure a sufficient number of other duplicate samples of such standards to supply the importers and dealers in tea at all ports desiring the same at cost. All teas, or merchandise described as tea, of inferior purity, quality, and fitness for consumption to such standards shall be deemed within the prohibition of the first section hereof.

"SEC. 4. That on making entry at the customhouses of all teas, or merchandise described as tea, imported into the United States, the importer or consignee shall give a bond to the collector of the port that such merchandise shall not be removed from the warehouse until released by the collector, after it shall have been duly examined with reference to its purity, quality, and fitness for consumption; that for the purpose of such examination samples of each line in every invoice of tea shall be submitted by the importer or consignee to the examiner, together with the sworn statement of such importer or consignee that such samples represent the true quality of each and every part of the invoice and accord with the specifications therein contained; or in the discretion of the Secretary of the Treasury, such samples shall be obtained by the examiner and compared by him with the standards established by this act; and in cases where said tea, or merchandise described as tea, is entered at ports where there is no qualified examiner as provided in section 7, the consignee or importer shall in the manner aforesaid furnish under oath a sample of each line of tea to the collector or other revenue officer to whom is committed the collection of duties, and said officer shall also draw or cause to be drawn samples of each line in every invoice and shall forward the same to a duly qualified examiner as provided in section 7: *Provided, however,* That the bond above required shall also be conditioned

for the payment of all customhouse charges which may attach to such merchandise prior to its being released or destroyed (as the case may be) under the provisions of this act.

"SEC. 5. That if, after an examination as provided in section 4, the tea is found by the examiner to be equal in purity, quality, and fitness for consumption to the standards hereinbefore provided, and no re-examination shall be demanded by the collector as provided in section 6, a permit shall at once be granted to the importer or consignee declaring the tea free from the control of the customs authorities; but if on examination such tea, or merchandise described as tea, is found, in the opinion of the examiner, to be inferior in purity, quality, and fitness for consumption to the said standards the importer or consignee shall be immediately notified, and the tea, or merchandise described as tea, shall not be released by the customhouse unless on a re-examination called for by the importer or consignee the finding of the examiner shall be found to be erroneous: *Provided,* That should a portion of the invoice be passed by the examiner, a permit shall be granted for that portion and the remainder held for further examination, as provided in section 6.

"SEC. 6. That in case the collector, importer, or consignee shall protest against the finding of the examiner, the matter in dispute shall be referred for decision to a board of three United States general appraisers, to be designated by the Secretary of the Treasury, and if such board shall, after due examination, find the tea in question to be equal in purity, quality, and fitness for consumption to the proper standards, a permit shall be issued by the collector for its release and delivery to the importer; but if upon such final re-examination by such board the tea shall be found to be inferior in purity, quality, and fitness for consumption to the said standards, the importer or consignee shall give a bond, with security satisfactory to the collector, to export said tea, or merchandise described as tea, out of the limits of the United States within a period of six months after such final re-examination; and if the same shall not have been exported within the time specified, the collector, at the expiration of that time, shall cause the same to be destroyed.

"SEC. 7. That the examination herein provided for shall be made by a duly qualified examiner at a port where standard samples are established, and where the merchandise is entered at ports where there is no qualified examiner the examination shall be made at that one of said ports which is nearest the port of entry, and that for this purpose samples of the merchandise, obtained in the manner prescribed by section 4 of this act, shall be forwarded to the proper port by the collector or chief officer at the port of entry; that in all cases of examination or re-examination of teas, or merchandise described as tea, by examiners or boards of United States general appraisers under the provisions of this act, the purity, quality, and fitness for consumption of the same shall be tested according to the usages and customs of the tea trade, including the testing of an infusion of the same in boiling water, and, if necessary, chemical analysis.

"SEC. 8. That in cases of re-examination of teas, or merchandise described as teas, by a board of United States general appraisers in pursuance of the provisions hereof, samples of the tea, or merchandise described as tea, in dispute, for transmission to such board for its decision, shall be put up and sealed by the examiner in the presence of the importer or consignee, if he so desires, and transmitted to such board, together with a copy of the finding of the examiner, setting forth the cause of

condemnation and the claim or ground of the protest of the importer relating to the same, such samples, and the papers therewith, to be distinguished by such mark that the same may be identified; that the decision of such board shall be in writing, signed by them, and transmitted, together with the record and samples, within three days after the rendition thereof, to the collector, who shall forthwith furnish the examiner and the importer or consignee with a copy of said decision or finding. The board of United States general appraisers herein provided for shall be authorized to obtain the advice, when necessary, of persons skilled in the examination of teas, who shall each receive for his services in any particular case a compensation not exceeding \$5.

"Sec. 9. That no imported teas which have been rejected by a customs examiner or by a board of United States general appraisers, and exported under the provisions of this act, shall be reimported into the United States under the penalty of forfeiture for a violation of this prohibition.

"Sec. 10. That the Secretary of the Treasury shall have the power to enforce the provisions of this act by appropriate regulations.

"Sec. 11. That teas actually on shipboard for shipment to the United States at the time of the passage of this act shall not be subject to the prohibition hereof, but the provisions of the act entitled 'An Act to prevent the importation of adulterated and spurious teas,' approved March 2, 1883, shall be applicable thereto.

"Sec. 12. That the act entitled 'An Act to prevent the importation of adulterated and spurious teas,' approved March 2, 1883, is hereby repealed, such repeal to take effect on the date on which this act goes into effect."

In explanation of the purpose of the act Mr. Payne, of New York, said:

"Mr. Speaker, in 1883 Congress passed an act to prevent the importation of impure and unwholesome tea, or tea harmful to health. We tried then to make as good a law as we knew how; but notwithstanding the stringency of that law, which provided for the re-exportation of all teas which did not come up to the standard, we find that to-day more poor, unwholesome tea, more tea sweepings and drug teas, are thrown upon the American market than upon all the other markets of the world. Our people consume more bad tea than all other countries. This is a subject about which we have heard a good deal for several years past in the Committee on Ways and Means. People interested in the tea trade, and interested in having only pure, wholesome teas imported into the United States, have appeared before that committee and set forth their various grievances and the difficulty of enforcing the old law. That law provided for inspectors to be appointed from men who were importers. Of course it was only human nature for those merchants to favor each other sometimes, and to favor themselves always in their decisions, and there was no appeal except to this board of merchants. The consequence is that the importation of poor teas into this country has increased.

"This bill is the result of the united efforts of the people engaged in the tea trade, the people anxious for wholesome food, the Treasury Department, the Senate of the United States, and the Committee on Ways and Means. A bill nearly identical in language and entirely identical in character was recommended by the Ways and Means Committee some days ago, and reported unanimously from that committee to the House. This particular bill was introduced into the Senate, and referred to the Committee on Commerce there, was unanimously reported to the Senate by that committee, and was passed by the Senate and sent

over here this morning. In brief, the bill provides that the Secretary of the Treasury shall appoint seven inspectors of tea in the United States, to be chosen from those who are experts in tea. These seven men are to receive each a salary of \$50 a year, to be paid out of the moneys appropriated for customs expenses.

"They are to meet every year and establish uniform standards of purity and fitness for consumption, which standards are to be embodied in samples. These samples are to be duplicated. There will be one at New York, one at Chicago, one at San Francisco, and the others are to be at such other places of import as the Secretary of the Treasury shall designate, and with these samples all importations of teas are to be compared. If the importation comes up to the samples, it can come in free of duty for consumption in the United States. If the importation does not come up to the standard, it is to be re-exported and excluded from consumption here."

Patent Laws.—The Congress passed, and the President approved March 3, 1897, an act revising and amending the statutes relating to patents, as follows:

"Be it enacted, etc., That section 4886 of the Revised Statutes be, and the same hereby is, amended by inserting on line 4, after the word 'country,' the words 'before his invention or discovery thereof,' and on line 5, after the word 'thereof,' the words 'or more than two years prior to his application,' so that the clause so amended will read as follows:

"Sec. 4886. Any person who has invented or discovered any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvements thereof, not known or used by others in this country before his invention or discovery thereof, and not patented or described in any printed publication in this or any foreign country before his invention or discovery thereof, or more than two years prior to his application, and not in public use or on sale in this country for more than two years prior to his application, unless the same is proved to have been abandoned, may, upon payment of the fees required by law and other due proceeding had, obtain a patent therefor."

"Sec. 2. That section 4920 of the Revised Statutes be, and the same hereby is, amended by adding to the third clause of said section after 'thereof' and before 'or' the following words: 'or more than two years prior to his application for a patent therefor'; so that the section so amended will read as follows:

"Sec. 4920. In any action for infringement the defendant may plead the general issue, and, having given notice in writing to the plaintiff or his attorney thirty days before, may prove on trial any one or more of the following special matters:

"First. That for the purpose of deceiving the public the description and specification filed by the patentee in the Patent Office was made to contain less than the whole truth relative to his invention or discovery, or more than is necessary to produce the desired effect; or,

"Second. That he had surreptitiously or unjustly obtained the patent for that which was in fact invented by another, who was using reasonable diligence in adapting and perfecting the same; or,

"Third. That it has been patented or described in some printed publication prior to his supposed invention or discovery thereof, or more than two years prior to his application for a patent therefor; or,

"Fourth. That he was not the original and first inventor or discoverer of any material and substantial part of the thing patented; or,

"Fifth. That it had been in public use or on sale in this country for more than two years before his application for a patent, or had been abandoned to the public.

"And in notices as to proof of previous invention, knowledge, or use of the thing patented, the defendant shall state the names of the patentees and the dates of their patents, and when granted, and the names and residences of the persons alleged to have invented or to have had the prior knowledge of the thing patented, and where and by whom it had been used; and if any one or more of the special matters alleged shall be found for the defendant, judgment shall be rendered for him with costs. And the like defenses may be pleaded in any suit in equity for relief against an alleged infringement; and proofs of the same may be given upon like notice in the answer of the defendant, and with the like effect."

"SEC. 3. That section 4887 of the Revised Statutes be, and the same hereby is, amended by inserting on line 1, after the words 'no person,' the words 'otherwise entitled thereto,' and on line 3, after the words 'caused to be patented,' the words 'by the inventor or his legal representatives or assigns,' and by erasing therein all that portion of the section which follows the words 'in a foreign country,' on lines 3 and 4, and substituting in lieu thereof the following: 'unless the application for said foreign patent was filed more than seven months prior to the filing of the application in this country, in which case no patent shall be granted in this country,' that the section so amended will read as follows:

"SEC. 4887. No person otherwise entitled thereto shall be debarred from receiving a patent for his invention or discovery, nor shall any patent be declared invalid, by reason of its having been first patented or caused to be patented by the inventor or his legal representatives or assigns in a foreign country, unless the application for said foreign patent was filed more than seven months prior to the filing of the application in this country, in which case no patent shall be granted in this country."

"SEC. 4. That section 4894 of the Revised Statutes be, and the same hereby is, amended by striking out the words 'two years' in every place where they occur and substituting in lieu thereof the words "one year"; so that the section so amended will read as follows:

"SEC. 4894. All applications for patents shall be completed and prepared for examination within one year after the filing of the application, and in default thereof, or upon failure of the applicant to prosecute the same within one year after any action therein, of which notice shall have been given to the applicant, they shall be regarded as abandoned by the parties thereto, unless it be shown to the satisfaction of the Commissioner of Patents that such delay was unavoidable."

"SEC. 5. That section 4898 of the Revised Statutes be, and the same hereby is, amended by adding thereto the following sentence:

"If any such assignment, grant, or conveyance of any patent shall be acknowledged before any notary public of the several States or Territories or the District of Columbia, or any commissioner of the United States circuit court, or before any secretary of legation or consular officer authorized to administer oaths or perform notarial acts under section 1750 of the Revised Statutes, the certificate of such acknowledgment, under the hand and official seal of such notary or other officer, shall be *prima facie* evidence of the execution of such assignment, grant, or conveyance; so that the section so amended will read as follows:

"SEC. 4898. Every patent or any interest therein shall be assignable in law by an instrument in writing, and the patentee or his assigns or legal representatives may in like manner grant and convey an exclusive right under his patent to the whole or any specified part of the United States. An assignment, grant, or conveyance shall be void as against any subsequent purchaser or mortgagee for a valuable consideration, without notice, unless it is recorded in the Patent Office within three months from the date thereof."

"If any such assignment, grant, or conveyance of any patent shall be acknowledged before any notary public of the several States or Territories or the District of Columbia, or any commissioner of the United States circuit court, or before any secretary of legation or consular officer authorized to administer oaths or perform notarial acts under section 1750 of the Revised Statutes, the certificate of such acknowledgment, under the hand and official seal of such notary or other officer, shall be *prima facie* evidence of the execution of such assignment, grant, or conveyance."

"SEC. 6. That section 4921 of the Revised Statutes be, and the same hereby is, amended by adding thereto the following sentence:

"But in any suit or action brought for the infringement of any patent there shall be no recovery of profits or damages for any infringement committed more than six years before the filing of the bill of complaint or the issuing of the writ in such suit or action, and this provision shall apply to existing causes of action; so that the section so amended will read as follows:

"SEC. 4921. The several courts vested with jurisdiction of cases arising under the patent laws shall have power to grant injunctions according to the course and principles of courts of equity, to prevent the violation of any right secured by patent, on such terms as the court may deem reasonable; and upon a decree being rendered in any such case for an infringement the complainant shall be entitled to recover, in addition to the profits to be accounted for by the defendant, the damages the complainant has sustained thereby; and the court shall assess the same or cause the same to be assessed under its direction. And the court shall have the same power to increase such damages, in its discretion, as is given to increase the damages found by verdicts in actions in the nature of actions of trespass upon the case."

"But in any suit or action brought for the infringement of any patent there shall be no recovery of profits or damages for any infringement committed more than six years before the filing of the bill of complaint or the issuing of the writ in such suit or action, and this provision shall apply to existing causes of action."

"SEC. 7. That in case where the head of any department of the Government shall request the Commissioner of Patents to expedite the consideration of an application for a patent, it shall be the duty of such head of department to be represented before the commissioner in order to prevent the improper issue of a patent."

"SEC. 8. That this act shall take effect Jan. 1, 1898, and sections 1, 2, 3, and 4, amending sections 4886, 4920, 4887, and 4894 of the Revised Statutes, shall not apply to any patent granted prior to said date, nor to any application filed prior to said date, nor to any patent granted on such an application."

Mr. Draper, of Massachusetts, said, in explanation of the measure, on reporting it to the House:

"Mr. Speaker, this bill proposes half a dozen minor amendments to the patent law which have been recommended unanimously by the American Bar Association. A year ago or more a committee of

that association was appointed to consider such amendments as might be found desirable in the patent law, and that committee, while unable to agree on matters which they considered of great moment, did agree to recommend the half dozen amendments which are embodied in this bill. I will not discuss the matter generally at length, but will take up these modifications one at a time and explain them to the House. I may say in the outset that the bill, in the reading, sounded somewhat formidable, because the entire statutes that are proposed to be amended were read.

"The first amendment is to section 4886. It provides that the patenting or publication of an invention in any foreign country more than two years prior to the application in this country shall be a bar to obtaining a patent. That is to say, if a patent is granted in a foreign country, then after two years from the grant of that patent the applicant can not obtain a patent in the United States, as he now can. As the law now stands, a man may publish or patent an invention in a foreign country and years afterward it may be patented in this country. In the United States if an inventor has his invention in public use more than two years before he applies for a patent he can not obtain a patent upon it. It seems to me, and it seems to your committee, that this amendment would be a very proper addition to the law, and an addition in the interest of the public.

"Section 5 of the bill is a matter of detail. It provides that a certificate of acknowledgment of assignment of a patent, before a proper officer, shall be *prima facie* evidence of execution.

"Section 6 provides a statute of limitation in patent causes. This is the only section upon which there was any difference of opinion in your committee. Some members of the committee thought that the statutes of limitation of the several States should control, whereas this bill proposes to make a universal statute of six years, covering the entire country. No minority report, however, has been filed, so that the bill stands as the recommendation of the committee.

"It is also sought in the bill to remedy an evil which some have considered almost an abuse in the Patent Office, namely, that an applicant for a patent can make his application, receive a rejection, wait two years before making an answer to the rejection, and continue in that way, so that the application may remain in the Patent Office a long time, a term of five or ten or possibly fifteen years, and then may come out of the office and cover the invention for seventeen years from the date of issue. This bill proposes an amendment to that part of the law by substituting the words 'six months' for the words 'two years,' so that after receiving a reply from the office to his application the applicant shall be required to make his answer within six months, thus reducing the length of time that an application can remain in the office. This, however, did not seem a sufficient limitation to your committee, and the amendments which they have proposed go still further in the direction of limiting not only the time that the applicant can delay answering the reply of the Patent Office to his application, but also limiting the time that his application can remain without final action in the office, except in cases of interference.

"A recent decision of the Supreme Court, to the effect that under the present law, properly interpreted, the term of a United States patent is to be limited by that of a foreign patent if the foreign patent was for the same invention and was issued before the patent granted by the United States. The fact is, that when this bill was prepared it was intended to cover cases of foreigners taking patents

in the United States. But there have arisen cases in which Americans, having made inventions, have applied simultaneously for an American patent and a foreign patent; and in such cases owing to the fact that in most foreign countries there is no system of examination, while in our country there is such a system, which delays the issue of the patent for months, at least, and possibly for years, the foreign patent has frequently come out first. In such cases, according to the decision to which I refer, the American patent expires at the date of the expiration of the foreign patent. The amendment to section 4887 was intended to cover these cases. It is proposed as an amendment to the existing law that the granting of a foreign patent to the same inventor or his assigns shall not affect the term of the United States patent unless the application for said foreign patent was filed more than seven months prior to the filing of the application in this country, in which case no patent shall be granted here. A similar provision exists in the laws or treaties of most European countries, and this provision, it is believed, will accomplish the object which the legislators had in view in framing the present law, and will obviate all of its present inconveniences."

Alien Ownership.—The Congress passed and the President, on March 2, 1897, approved an act to better define and regulate the rights of aliens to hold and own real estate in the Territories. It is as follows:

"*Be it enacted, etc.,* That an act entitled 'An Act to restrict the ownership of real estate in the Territories to American citizens, etc.,' approved March 3, 1887, except so far as it affects real estate in the District of Columbia, be, and the same is hereby, amended so as to read as follows:

"That no alien or person who is not a citizen of the United States, or who has not declared his intention to become a citizen of the United States in the manner provided by law, shall acquire title to or own any land in any of the Territories of the United States except as hereinafter provided: *Provided,* That the prohibition of this section shall not apply to cases in which the right to hold or dispose of lands in the United States is secured by existing treaties to citizens or subjects of foreign countries, which rights, so far as they may exist by force of any such treaty, shall continue to exist so long as such treaties are in force, and no longer.

"Sec. 2. That this act shall not apply to land now owned in any of the Territories of the United States by aliens which was acquired on or before March 3, 1887, so long as it is held by the then owners, their heirs or legal representatives, nor to any alien who shall become a *bona fide* resident of the United States, and any alien who shall become a *bona fide* resident of the United States, or shall have declared his intention to become a citizen of the United States in the manner provided by law, shall have the right to acquire and hold lands in either of the Territories of the United States upon the same terms as citizens of the United States: *Provided,* That if any such resident alien shall cease to be a *bona fide* resident of the United States, then such alien shall have ten years from the time he ceases to be such *bona fide* resident in which to alienate such lands. This act shall not be construed to prevent any persons not citizens of the United States from acquiring or holding lots or parcels of lands in any incorporated or platted city, town, or village, or in any mine or mining claim, in any of the Territories of the United States.

"Sec. 3. That this act shall not prevent aliens from acquiring lands or any interests therein by inheritance or in the ordinary course of justice in the collection of debts, nor from acquiring interests in real estate or any interest therein, nor from lending

money and securing the same upon real estate or any interest therein, nor from enforcing any such lien, nor from acquiring and holding title to such real estate or any interest therein upon which a lien may have heretofore or may hereafter be fixed, or upon which a loan of money may have been heretofore or hereafter may be made and secured: *Provided, however*, That all lands so acquired shall be sold within ten years after title shall be perfected in him under said sale or the same shall escheat to the United States and be forfeited as hereinafter provided.

"Sec. 4. That any alien who shall hereafter hold lands in any of the Territories of the United States in contravention of the provisions of this act may nevertheless convey his title thereto at any time before the institution of escheat proceedings as hereinafter provided: *Provided, however*, That if any such conveyance shall be made by such alien, either to an alien or to a citizen of the United States, in trust and for the purpose and with the intention of evading the provisions of this act, such conveyance shall be null and void, and any such lands so conveyed shall be forfeited and escheat to the United States.

"Sec. 5. That it shall be the duty of the Attorney-General of the United States, when he shall be informed or have reason to believe that lands in any of the Territories of the United States are being held contrary to the provisions of this act, to institute or cause to be instituted suit in behalf of the United States in the district court of the Territory in the district where such land or a part thereof may be situated, praying for the escheat of the same on behalf of the United States to the United States: *Provided*, That before any such suit is instituted the Attorney-General shall give or cause to be given ninety days' notice by registered letter of his intention to sue, or by personal notice directed to or delivered to the owner of said land, or the person who last rendered the same for taxation, or his agent, and to all other persons having an interest in such lands of which he may have actual or constructive notice. In the event personal notice can not be obtained in some one of the modes above provided, then said notice shall be given by publication in some newspaper published in the county where the land is situate, and if no newspaper is published in said county, then the said notice shall be published in some newspaper nearest said county.

"Sec. 6. That if it shall be determined upon the trial of any such escheat proceedings that the lands are held contrary to the provisions of this act, the court trying said cause shall render judgment condemning such lands and shall order the same to be sold as under execution: and the proceeds of such sale, after deducting costs of such suit, shall be paid to the clerk of such court so rendering judgment, and said fund shall remain in the hands of such clerk for one year from the date of such payment, subject to the order of the alien owner of such lands, or his heirs or legal representatives; and if not claimed within the period of one year, such clerk shall pay the same into the treasury of the Territory in which the lands may be situated, for the benefit of the available school fund of said Territory: *Provided*, That the defendant in any such escheat proceedings may, at any time before final judgment, suggest and show to the court that he has conformed with the law, either becoming a *bona fide* resident of the United States, or by declaring his intention of becoming a citizen of the United States, or by the doing or happening of any other act which, under the provisions of this act, would entitle him to hold or own real estate, which being admitted or proved, such suit shall be dismissed on payment of costs and a reasonable attorney fee.

"Sec. 7. That this act shall not in any manner be construed to refer to the District of Columbia, nor to authorize aliens to acquire title from the United States to any of the public lands of the United States or to in any manner affect or change the laws regulating the disposal of the public lands of the United States. And the act of which this act is an amendment shall remain in force and unchanged by this act so far as it refers to or affects real estate in the District of Columbia.

"Sec. 8. That all laws and parts of laws so far as they conflict with the provisions of this act are hereby repealed."

In the Senate Mr. White, of California, made this brief explanation of the scope of the measure:

"The object to be attained is this: The present law in reference to the holding of lands in the Territories by aliens virtually shuts out all capital. For instance, in the case of a corporation, aliens can not hold over 20 per cent. of the capital stock. While this bill imposes a great many restrictions, as Senators will see, to holdings by aliens, it is not as drastic as the law which it amends. So far as I am personally concerned, I would impose no restriction, for I should be delighted to see money put into the Territories, whether by aliens or not. In fact, in some cases, I should a little rather see it come from aliens than from anybody in this country. To-day there are hundreds of thousands of dollars which can be invested in the Territories, and, notwithstanding our present ideas regarding diplomacy, I do not suppose any one will contend that the foreigner could run away with the Territory. He might possibly have the title, and if he put in his money it is hard to say which would be the better off. The people of the Territories, so far as I know, those who have interests there and who wish to see the Territories built up, are in favor of the bill. The representatives are in favor of it, and those of us who know something about it, so far as I am aware, favor the measure."

Patent Cases.—The Congress passed, and the President, on March 3, 1897, approved the following act defining the jurisdiction of the United States circuit courts in cases brought for the infringement of patents:

"*Be it enacted, etc.*, That in suits brought for the infringement of letters patent the circuit courts of the United States shall have jurisdiction, in law or in equity, in the district of which the defendant is an inhabitant, or in any district in which the defendant, whether a person, partnership, or corporation, shall have committed acts of infringement and have a regular and established place of business. If such suit is brought in a district of which the defendant is not an inhabitant, but in which such defendant has a regular and established place of business, service of process, summons, or subpoena upon the defendant may be made by service upon the agent or agents engaged in conducting such business in the district in which suit is brought."

Mr. Lacey, of Iowa, said in support of the measure, which was not seriously opposed:

"Mr. Speaker, I introduced this bill at the suggestion of a number of gentlemen who live in the Northwest, and who have interest in patent rights that are frequently infringed in distant localities, and yet the sales of the patented articles so infringed are largely, or mainly, made in the vicinity where the owners of the patent happen to be located. For instance, the manufactory may be established at some distant point and the office where the goods are sold is opened in Chicago or in St. Louis or some other distant city. They have a permanent place of business at either city, and yet no relief can be had in the courts where the infringement is mainly carried on.

"The main purpose of the bill is to give original jurisdiction to the court where a permanent agency transacting the business is located, and that business is engaged in the infringement of the patent rights of some one who has such rights anywhere in the United States.

"Jurisdiction would be had thus in Chicago, St. Louis, or any Western city if the manufacturer is established there, or if there is a permanent agency there, but not otherwise. It provides that the court shall have jurisdiction in the district of which the defendant is an inhabitant, and that is the existing law now, or in any district in which the defendant, whether a person, partnership, or corporation, shall have committed acts of infringement and have a regular and established place of business." That is all there is of it. Isolated cases of infringement would not confer this jurisdiction, but only where a permanent agency is established."

Petroleum Lands.—The Congress passed without discussion and the President approved, Feb. 11, 1897, the following act to authorize the entry and patenting of lands containing petroleum and other mineral oils under the placer mining laws of the United States:

"Be it enacted, etc., That any person authorized to enter lands under the mining laws of the United States may enter and obtain patent to lands containing petroleum or other mineral oils, and chiefly valuable therefor, under the provisions of the laws relating to placer mineral claims: *Provided*, That lands containing such petroleum or other mineral oils which have heretofore been filed upon, claimed or improved as mineral, but not yet patented, may be held and patented under the provisions of this act the same as if such filing, claim, or improvement were subsequent to the date of the passage hereof."

"It had been the custom for some years to deal with such lands under the provision of the placer mining laws; but the necessity for new legislation was thus explained in a committee report:

"Under a decision of the Secretary of the Interior, dated Aug. 27, 1896, in the case of mineral entry No. 140, Los Angeles district, California, the Secretary held that lands containing oils could not be patented under the placer-mining acts, for the reason that the acts did not originally contemplate the extension of their provisions to lands of this character. It has never been held by any authority that the provisions of the placer acts were not adequate to meet the conditions surrounding the development of mineral oils. The effect of the above cited decision of Aug. 27, 1896, is to preclude the possibility of obtaining title to lands containing oils, and as there are large arrears of such lands in various of the public-land States, and as upon these lands in many instances large expenditures have already been made, and as it is manifestly for the public good that there should be some provision whereby these lands may be held and patented, the committee believe this bill should pass.

"The honorable Commissioner of the General Land Office, to whom the bill was referred, states that there is urgent necessity for some legislation on this subject, and in this view the Secretary of the Interior concurs. The bill simply provides by legislation for procedure in the entry and patenting of these lands along the lines that have been pursued in the past under the decisions of the General Land Office, so that there is no departure whatever from the procedure in the past for the development and acquirement of such properties.

"While it is quite probable, as recited by the honorable Secretary of the Interior in his decision of Aug. 27, 1896, the provisions of the placer acts were not originally intended to extend to lands

containing mineral oils, the same was at that time, possibly, having in mind only such famous minerals, and the existence of public lands of the public lands being at that time not very common, it is nevertheless true that the provisions of these acts are calculated to aid in the development and purchase of lands of this character, and that persons having been extended to such lands in the past under rulings of the department well understood, it is entirely proper that the provisions of these acts shall now be extended to so to embrace containing lands."

Belated Pensions.—The Congress passed a bill granting pensions to Gray's Battalion of Arkansas Volunteers as follows:

"Be it enacted, etc., That the Secretary of the Interior be, and he is hereby authorized and directed to place on the pension roll the names of all of the honorably discharged surviving officers and enlisted men of Gray's Battalion of Arkansas Volunteers raised under the act of Congress of May 18, 1846, for service during the war with Mexico; and the names of surviving widows of such officers and enlisted men, subject to the limitations and regulations of the pension laws of the United States for pensioning the survivors of the war with Mexico."

Mr. Mill, of Arkansas, made this explanation of the measure:

"This little bill, Mr. Chairman, carries relief to less than thirty people. These men in 1846 and 1847 were citizens of the State of Arkansas. Those who are affected by the bill are now all old men and widows, people standing with one foot in the grave and the other hard by. In 1846 they volunteered and signed a muster roll which pledged them to go to Mexico. They were not sent there, because the authorities concluded to send them up into the Indian Territory. They served there from six to eight months, the five companies of this little battalion. When the Mexican War act was passed in June, 1887, and when that grand soldier, Gen. John C. Black, of Illinois, was administering the Pension Office, he took a liberal view of that law and placed these people upon the pension rolls under the Mexican War act as fast as they made their proofs. But with the advent of the Harrison administration the then Commissioner of Pensions took a different view of the law and refused to place any more of them upon the roll, holding that they did not come within the purview of the Mexican War act.

"When I came to Congress, in July, 1893, I came with a petition or two in my pocket from men who had been suspended from the rolls, men who were members of this little Gray's battalion. I went to see Commissioner Lochren, who told me the history of the matter, which I have here and which is embodied in the report. He said that he had found the ruling of his predecessor upon the record, and that he was not inclined to reverse it and to hold that he could place these men and their widows upon the pension rolls under the Mexican War act.

"Immediately after that I introduced this special bill for their relief, and I have pressed it, Mr. Chairman, continuously, in season and out of season; not out of season, because it was never out of season; but all the time that was proper and legitimate I have tried to get relief for these few people left this side of the grave.

"Now, Mr. Chairman, I do not think it is necessary to detain the committee longer in the consideration of this question. I confess to a great deal of interest in this bill, because it is a question that has occupied more of my attention than almost any other, on account of the injustice that has been done to a few old people in this case, and their widows, men who volunteered in 1846 and

followed the flag of their country even to the halls of the Montezumas, braving death and disease, but who have been unable to get in under the Mexican War pension act."

The claim to pensions for these men was the same as that of Powell's battalion of Missouri Mounted Volunteers, whose surviving members were pensioned in 1891, though they never went to Mexico. The President allowed the measure to become a law without his signature.

Pass a Loutre Crevasse.—The Congress passed and the President approved, Feb. 26, 1897, an act to provide for closing the crevasse in Pass a Loutre, one of the outlets of the Mississippi. It is as follows:

"That the sum of \$250,000, or so much thereof as may be necessary, be, and is hereby, appropriated, out of any money in the Treasury not otherwise appropriated, to close the crevasse in Pass a Loutre of the Mississippi river, to be expended under the direction and according to the plans and specifications of the Secretary of War.

"SEC. 2. That nothing herein contained shall be held or construed to destroy or impair any right or rights of the United States arising under the acts of March 3, 1875, June 19, 1878, and March 3, 1879, containing the contract or contracts between James B. Eads and such persons as might become associated with him and the United States, or to release the legal representatives of said James B. Eads or other persons associated with him, jointly or severally, from any obligation, expressed or implied, arising under and from said acts or other acts pertaining thereto: *Provided*, That nothing herein contained shall be held or construed to release in any wise the executors of the estate of James B. Eads as such executors, or the associates of said James B. Eads, jointly or severally, in whole or in part, from any liability which now exists, if any such liability does exist, for a failure to close said Pass a Loutre crevasse, and the question of such liability shall be referred to the Attorney-General, after a full hearing to both parties, for his decision; and should the decision of the Attorney-General be to the effect that the responsibility for the closing of the said Pass a Loutre crevasse rests upon the executors of the estate of James B. Eads as such executors, and the associates of the said James B. Eads, jointly or severally, under existing laws, then upon the completion of the twenty years' contract for the maintenance of the channel in South Pass outlet of the Mississippi river, as the same now exists, the Secretary of War shall withhold so much of the money then to be paid to the executors of the estate of James B. Eads as such executors, or to the associates of the said James B. Eads, jointly or severally, as shall have been expended under the authority of this act, until the same shall be judicially or otherwise legally determined in favor of such executors as such executors, or said associates of James B. Eads, jointly or severally."

The reason for the measure was thus set forth by Mr. Reeves, of Illinois:

"Mr. Speaker, I do not know that the House needs any special information on this bill, and I shall only offer a word in explanation. Of the three outlets of the Mississippi river, only one of them, known as South Pass, is navigable at the present time. A crevasse has occurred within the last few years in one of these passes, and has been constantly enlarging, at a distance of about a mile and a quarter below the head of the pass. The effect of this crevasse has been to draw away from the other two passes of the river a portion of the water that should go through the navigable outlet of the river. The engineers of the Government in charge at this part of the river inform us, and we are also informed by

men engaged in business on the river, that if this crevasse is not stopped the entire commerce of the Mississippi river below New Orleans is threatened.

"The Committee on Rivers and Harbors, after hearing from the engineers of the Government and others, among them business men from New Orleans, decided to inspect the condition of affairs down there, and 12 of us went to this place and closely examined it. The committee are unanimously of the opinion that unless this crevasse is stopped the entire commerce of the river, which is more than 5,000,000 tons annually, is threatened. I take it that the necessity of keeping this river open is not a question before this House or the country. The only question is as to the necessity for doing this at this time. The best judgment we have been able to obtain is that this crevasse can now be stopped for \$250,000, whereas if it is not stopped until the high floods come again and again it will cost the Government \$1,000,000 to do it. The committee are unanimously of the opinion that an emergency does exist, that it is outside of and away from the functions or duty of the executors of the Eads estate, and that there is nothing left for us to do but to take this course, or jeopardize the commerce of the river."

The Military Parks.—The Congress passed and, on March 3, 1897, the President approved the following measure to prevent trespassing upon and providing for the protection of the national military parks:

"*Be it enacted, etc.*, That every person who willfully destroys, mutilates, defaces, injures, or removes any monument, statue, marker, guidepost, or other structure, or who willfully destroys, cuts, breaks, injures, or removes any tree, shrub, or plant within the limits of any national park shall be deemed guilty of a misdemeanor, punishable by a fine of not less than \$10 nor more than \$1,000 for each monument, statue, marker, guidepost, or other structure, tree, shrub, or plant destroyed, defaced, injured, cut, or removed, or by imprisonment for not less than fifteen days and not more than one year, or by both fine and imprisonment.

"SEC. 2. That every person who shall trespass upon any national park for the purpose of hunting or shooting, or who shall hunt any kind of game thereon with gun or dog, or shall set trap or net or other device whatsoever thereon for the purpose of hunting or catching game of any kind, shall be guilty of a misdemeanor, punishable by a fine of not more than \$1,000, or by imprisonment for not less than five days or more than thirty days, or by both fine and imprisonment.

"SEC. 3. That the superintendent or any guardian of such park is authorized to arrest forthwith any person engaged or who may have been engaged in committing any misdemeanor named in this act, and shall bring such person before any United States commissioner or judge of any district or circuit court of the United States within either of the districts within which the park is situated, and in the district within which the misdemeanor has been committed, for the purpose of holding him to answer for such misdemeanor, and then and there shall make complaint in due form.

"SEC. 4. That any person to whom land lying within any national parks may have been leased, who refuses to give up possession of the same to the United States after the termination of said lease, and after possession has been demanded for the United States by any park commissioner or the park superintendent, or any person retaining possession of land lying within the boundary of said park which he or she may have sold to the United States for park purposes and have received payment therefor, after possession of the same has been

demanded for the United States by any park commissioner or the park superintendent, shall be deemed guilty of trespass, and the United States may maintain an action for the recovery of the possession of the premises so withheld in the courts of the United States according to the statutes or code of practice of the State in which the park may be situated.

"Sec. 5. This act shall apply only to the military parks of the United States.

Reservoir Sites.—Feb. 17, 1897, the House of Representatives passed the following measure to provide for the use and occupation of reservoir sites reserved by the Geological Survey:

"Be it enacted, etc., That all reservoir sites reserved or to be reserved by the Geological Survey be open to use and occupation under the right-of-way act of March 3, 1891.

"*Provided*, That the charges for water coming in whole or part from reservoir sites used and occupied under the provisions of this act shall always be subject to the control of the respective States and Territories in which such reservoirs are in whole or part situate."

The bill as originally reported was without any proviso in the way of safeguard. In support of the measure, Mr. Lacey, of Iowa, said:

"In 1888 a clause was inserted in a general appropriation bill which was not considered by either the Committee on Arid Lands or the Committee on the Public Lands, in the following language, and I read now from page 527 of the Acts of the Fiftieth Congress, near the top of the page:

"All the lands which may hereafter be designated or selected by such United States surveys for sites for reservoirs, ditches, or canals for irrigation purposes and all the lands made susceptible of irrigation by such reservoirs, ditches, or canals are from this time henceforth hereby reserved from sale as the property of the United States, and shall not be subject after the passage of this act to entry, settlement, or occupation until further provided by law."

"That bill appropriated \$100,000 for the purpose of setting apart and selecting certain sites for reservoirs for the impounding of water for the irrigation of the lands in the arid regions of the United States.

"This proposition was considered by the department as broad enough to practically withdraw from settlement, improvement, and occupation the arid lands of the country. Such was not the intention of the Committee on Appropriations, such was not the intention of the House, but this act, segregating the reservoir sites from occupation and settlement, drawn as it was, went further, and practically withdrew from settlement and improvement the arid region of the United States.

"In 1891 a bill was passed—the 'right-of-way bill'—which had been prepared, I believe, by a commission of nine Senators. This bill was intended to take the place of the crude provisions of the act of 1888, and it was the manifest purpose and intention of that bill to provide that the very reservoir sites that had been theretofore set apart by the Geological Survey should be used and occupied under this right-of-way act of 1891. But the act of 1891 provided that reservoirs of the United States should not be affected by the bill.

"The very pith and marrow of the whole question involved in the bill now being considered by the House is contained in the statement that it was not contemplated that these sites should be reserved from use, but for use. The act of 1888, as amended by the act of 1891, as construed by the Secretary of the Interior, reserves these reservoirs from use and not for use. A reservoir site without water is entirely useless. The water is the particular thing in question, and the waters are controlled

by the States through which they flow, and not by the United States of America. These are surface waters, the waters of small streams not navigable, and the States control them.

"Now, the act of 1888, as amended by the act of 1891, having set apart the most valuable reservoir sites all over the United States, and having been construed as reserving them from occupation, the Government is placed in the position of a *big game mangle*. We will neither eat the hay nor use it, nor let anybody else eat it. The result is that these sites, instead of being flooded with water and a source of plenty and wealth to the regions in which they are located and where they ought to be used, stand as arid as the surrounding country, and persons who desire, under the act of 1891, to impound water, must select some less eligible site outside of the boundary of the Government site, and there collect the water. In a number of instances this has already been done, and the water has been diverted from the Government reservoir and used for irrigation, at an increased expense, because the natural sites have been reserved and are not allowed to be used for the purpose for which the Almighty evidently intended them in the formation of that country.

"It is proposed by amendment that the act of 1891 should be enlarged, so that not only corporations and individuals, under the right-of-way act, may select reservoir sites upon these lands, but that the States in which they are located may, by proper legislation and under suitable regulations to be prescribed by the Secretary of the Interior, likewise use them for the same purpose.

"There are a very large number of these sites. They have been selected at great expense in every part of the arid regions of the United States, with the possible exception of Idaho, and the Government does not propose now, for a single moment, to consider this proposition of inserting an appropriation into any of the various appropriation acts for the purpose of utilizing these sites at the expense of the United States. For all of these years the Government has not utilized a single one of them. The present director of the Geological Survey, I am informed, is heartily in favor of modifying the law, so that the sites selected may be utilized.

"The provision that was inserted into the appropriation bill of 1888 had this beneficial effect: It prevented settlers from going in and locating homesteads in the controlling portions of land especially suited to the purpose of a reservoir; it prevented private individuals from taking possession for the purpose of selling out subsequently to water companies; the act prevented them from blocking the way of progress by withdrawing these tracts from settlement. To that extent the act of 1888 has proved beneficial and wise, and these sites are now where they can be occupied. Shall they be used? Shall water companies, shall private individuals, shall the States in which the sites are located be permitted now to go on and exercise their right under the act of 1891 and utilize these sites, or shall they be continued indefinitely as a blotch or a blight upon the Territories or the States in which they are located?

"That, Mr. Speaker, is substantially all there is involved in this bill. The commissioner of the General Land Office thought that no further legislation was necessary; that under the act of 1891 the people had full power to do what is proposed in this bill; but the Secretary of the Interior, on the other hand, has held differently; and whatever we may think about the act of 1891, it is now agreed that under that act these reservoir sites cannot be utilized, and therefore this bill becomes necessary."

Mr. Terry, of Arkansas, said: "I am glad to adopt

tion of certain additional safeguards that he had effected in the form of a substitute:

"Let us, here and now, when we are making this concession, reserve to the Government of the United States, through their Congress, the power to prevent injustice and abuse by any of these corporations. As I stated the other day, I have no arid lands in my district or State, but years ago I spent a good deal of time in the great West, and there I heard numerous complaints on all sides from the ranchmen of the extortion and monopolistic oppression that was practiced by some of the water companies. I understand that since that time some of the States have taken the matter in hand and have passed laws to regulate it; but there is a certain point beyond which we might lose the power of regulation. If we make no such regulation now, it might be contended at some time in the future that, as we had given the right without reserving the right to regulate charges, the States could not interpose to regulate them. The States may, of course, control the water within their borders to a certain extent, but many of these reservoirs are of a peculiar kind—lakes which do not flow at all except when there has been a considerable melting of snow on the mountains, so that the entire body of water is found on the Government's land.

"Now, if we give to companies or individuals the right to enter upon these reservoirs and do not make any reservation, it might become a question hereafter as to whether the States could control or regulate them.

"I seriously believe, Mr. Speaker, that when we are making a concession such as is proposed to be made here, we have the right to prescribe the conditions upon which it shall be made. I believe we have the power to say that any company or corporation that shall avail itself of the concessions that we here grant shall do so upon certain terms. You have a right to sell a piece of land to a man, and when you do sell it you part with the title, but at the same time you have a right to make the sale upon the condition that no saloon shall ever be put upon it. Now, when the United States makes a concession like this, it has a right to fix the conditions, and I have no doubt whatever that Congress has the right to make the reservation that is contemplated in the proposed fourth section of the substitute.

"Wherever the fact is brought to the attention of the Secretary of the Interior that there are already sufficient regulations provided for the protection of the people, he will not step in. But if it should ever be found that a corrupt set of officials have refused to protect the people, let us have the remedy here to protect the people in the benefits of those reservoir sites. Whenever it is found that the States have done their duty, then, under the provision I proposed, the matter will be left in the hands of the State. Where it is found that the Territorial Legislature has done its duty, this provision allows the control of the matter to remain in the hands of the local assembly. But until we have such an assurance, let us retain control of the matter here in our own hands."

The act was approved by the President, Feb. 26, 1897.

Mutilating United States Coins.—The Congress passed and the President, on March 3, 1897, approved the following act to amend section 5459 of the Revised Statutes, prescribing the punishment for mutilating United States coins and for uttering or passing or attempting to utter or pass such mutilated coins:

"SEC. 5459. Every person who fraudulently, by any art, way, or means, defaces, mutilates, impairs, diminishes, falsifies, scales, or lightens, or causes

or procures to be fraudulently defaced, mutilated, impaired, diminished, falsified, sealed, or lightened, or willingly aids or assists in fraudulently defacing, mutilating, impairing, diminishing, falsifying, sealing, or lightening the gold or silver coins which have been, or which may hereafter, be coined at the mints of the United States, or any foreign gold or silver coins which are by law made current or are in actual use or circulation as money within the United States, or who passes, utters, publishes, or sells, or attempts to pass, utter, publish, or sell, or bring into the United States from any foreign place knowing the same to be defaced, mutilated, impaired, diminished, falsified, sealed, or lightened, with intent to defraud any person whatsoever, or has in his possession any such defaced, mutilated, impaired, diminished, falsified, sealed, or lightened coin, knowing the same to be defaced, mutilated, impaired, diminished, falsified, sealed, or lightened, with intent to defraud any person whatsoever, shall be imprisoned not more than five years and fined not more than \$2,000.

Much Discussed, but not Decided.—The policy of the Government with regard to Cuba was the subject of much discussion during this session of Congress, and various resolutions were introduced and discussed relating to the recognition of belligerent rights, Cuban independence, and the treatment of Americans on the island. But no important action was taken, as there was less disposition than heretofore to force the Executive into aggressive measures.

A bill to establish a uniform law on the subject of bankruptcy throughout the United States was debated in the Senate at great length as usual, and as usual the matter remained unsettled.

The affairs of the Pacific Railroads were the subject of discussion in various phases, but nothing definite was accomplished.

Both House and Senate passed an act for the appointment of a nonpartisan commission to collate information and to consider and recommend legislation to meet the problems presented by labor, agriculture, and capital; but the President failed to take up the matter before the close of the session.

One of the most interesting and important topics was the bill to amend the act entitled "An Act to incorporate the Maritime Canal Company of Nicaragua approved Feb. 20, 1889." It involved a change of Government policy in regard to the enterprise, and the Senate, though coming to no conclusion, gave the matter a full discussion.

Less important measures that went more or less close to a final passage were an act to amend section 1858 of the Revised Statutes, covering the appointment of Territorial officers; a bill to amend an act entitled "An Act to repeal the timber-culture laws and for other purposes"; an act for the prevention of the introduction and spread of contagious diseases into the United States; a bill providing for free homesteads on the public lands in Oklahoma Territory for actual and *bona fide* settlers, and reserving the public lands for that purpose; an act to simplify the system of making sales in the subsistence department to officers and enlisted men of the army; a bill to limit the effect of the regulation of commerce between the several States and with foreign countries in certain cases.

Three of the regular appropriation bills—the agricultural, the Indian, and the Sunday civil—fell by the way, the President taking no action before the close of the session. A deficiency bill failed through disagreement of the House and the Senate.

Miscellaneous.—Apart from the various private pension bills and measures granting American registry to certain vessels, the following minor acts were passed:

For the better improvement of the Government reservation at the city of Fort Smith, in the State of Arkansas, and for other purposes.

To validate the appointments, acts, and services of certain deputy United States marshals in the Indian Territory, and for other purposes.

Approving certain acts of the Legislative Assembly of the Territory of New Mexico, authorizing the issue of certain bonds of said Territory.

Providing for the erection of a lighthouse at Orient Point, Long Island, New York.

Authorizing every judge of a district court of the United States to appoint a stenographic reporter, and fixing the duties and compensation of such reporter.

To provide for appointment by brevet of active or retired officers of the United States army.

To provide for the removal of the Interstate National Bank of Kansas City, Kan., to Kansas City, Mo.

To aid and encourage the holding of the Tennessee Centennial Exposition at Nashville, Tenn., in the year 1897, and making an appropriation therefor.

To provide for an examination and survey of a water route from the mouth of the jetties at the city of Galveston, Texas, through the ship canal and up Buffalo Bayou to the city of Houston, Texas.

To permit a part of the Fort Lyon Military Reservation to be occupied, improved, and controlled for a soldier's home by the State of Colorado.

Relating to mortgages in the Indian Territory.

To grant a right of way through the Fort Spokane Military Reservation, in the State of Washington, to the St. Paul, Minneapolis and Manitoba Railway Company.

To amend an act entitled "An Act granting to the Eastern Nebraska and Gulf Railway Company right of way through the Omaha and Winnebago Indian reservations, in the State of Nebraska," by extending the time for the construction of said railway.

To extend the time for the completion of the St. Paul, Minneapolis and Manitoba Railway Company through the White Earth, Leech Lake, Chippewa, and Fond du Lac Indian reservations in the State of Minnesota.

To authorize the Muskogee, Oklahoma and Western Railroad Company to construct and operate a line of railway through Oklahoma and the Indian Territory, and for other purposes.

To provide times and places for holding terms of United States courts in Utah.

Extending the time within which the University of Utah shall occupy lands heretofore granted to it.

To provide a life-saving station at or near Point Arena, Mendocino County, in the State of California.

To amend the act creating the circuit court of appeals in regard to fees and costs, and for other purposes.

To vacate Sugar Loaf Reservoir site in Colorado, and to restore the lands contained in the same to entry.

To authorize the establishment of a life-saving station at or near Great Boars Head, on the coast of New Hampshire.

To enable the town of Flagstaff, in the Territory of Arizona, to issue bonds to construct a water system.

To amend an act entitled "An Act to forfeit certain lands heretofore granted for the purpose of aiding in the construction of railroads, and for other purposes, approved Sept. 29, 1890, and the several acts amendatory thereof."

To constitute a new division of the eastern judi-

cial district of Texas, and to provide for the holding of terms of court at Beaumont, Texas, and for the appointment of a clerk for said court.

To reorganize the judicial districts of Arkansas, and for other purposes.

To authorize the Secretary of the Interior to use Fort Bidwell for an Indian training school.

To prevent forest fires on the public domain.

Providing for a comprehensive index to Government publications from 1891 to 1893.

To authorize officers who served during the war of the rebellion in the regular army to bear the title, and, on occasions of ceremony, wear the uniform of their highest rank.

To amend "An Act to amend 'An Act to amend section 4400 of Title LII of the Revised Statutes of the United States, concerning the regulation of steam vessels,' approved Aug. 7, 1892"; and also to amend section 4414, Title LII, of the Revised Statutes, "Regulation of steam vessels."

To detach the county of Audrain from the western district of Missouri and to attach the same to the eastern district of said State of Missouri.

Concerning certain homestead lands in Florida.

To amend an act granting to the Duluth and Winnipeg Railroad Company a right of way through the Chippewa and White Earth Indian reservations in the State of Minnesota.

To quiet title and possession with respect to certain unconfirmed and located private land claims in Louisiana.

Continuing in force section 2 of the act approved June 3, 1896, entitled "An Act to repeal section 61 of an act to reduce taxation, to provide revenue for the Government, and for other purposes," which became a law Aug. 28, 1894. The subject-matter is the use of alcohol in the arts.

To amend an act entitled "An Act authorizing the appointment of receivers of national banks, and for other purposes," approved June 30, 1876, as amended by an act approved Aug. 3, 1892.

That lighthouses and other aids to navigation be established and erected as hereinafter set forth, to wit: Completing the removal of Cape San Blas light station, Florida, to Blacks Island. Building a light-keeper's dwelling at Egmont Key light station, Florida. Reconstructing the front beacon of Appalachicola Bay range-light station, Florida. Establishing a light station at or near St. Joseph Point, in St. Joseph Bay, west coast of Florida. Establishing range lights to mark the channel over the bar, entrance to Choctawhatchee Bay. Repairing wharf and buildings of the depot at Key West, Fla.

To amend section 40 of "An Act to reduce the revenue and equalize duties on imports, and for other purposes," approved Oct. 1, 1890, so as to authorize the sale of forfeited domestic smoking opium to the highest bidder.

To extend and amend an act entitled "An Act to grant the right of way to the Kansas, Oklahoma Central and Southwestern Railway Company through the Indian Territory and Oklahoma Territory, and for other purposes," approved Dec. 21, 1893.

To prevent the purchasing of or speculating in claims against the Federal Government by United States officers.

To authorize the Montgomery, Hayneville and Camden Railroad Company to construct and maintain a bridge across the Alabama river between Lower Peachtree and Prairie Bluff, Ala.

To approve and ratify the construction of a bridge over and across Caddo lake, at Mesquiteport, La., by the Kansas City, Shreveport and Gulf Railway Company.

To amend the act entitled "An Act to authorize

the construction of a bridge across the Missouri river at or near the city of Lexington, Mo.," approved July 26, 1894.

To authorize the construction of a bridge over the Monongahela river from the borough of Braddock to the township of Mifflin, Pa.

To authorize the construction and maintenance of a bridge across the St. Lawrence river.

To authorize the mayor and city council of Monroe and the police jury of the parish of Ouachita, La., to construct a traffic bridge across the Ouachita river opposite said city.

Authorizing the Kansas City, Watkins and Gulf Railway Company to construct and maintain a bridge across the Black river, in Louisiana.

Authorizing the Kansas City, Watkins and Gulf Railway Company to construct and maintain a bridge across Red river at the city of Alexandria, La.

To approve and ratify the construction of a bridge across the Sulphur river, in the State of Arkansas, by the Texarkana and Fort Smith Railway Company.

To approve and ratify the construction of a bridge across the Red river, between the States of Arkansas and Texas, at a point above the town of Fulton, in Arkansas, on said river, built by the Texarkana Northern Railway Company, but now owned and operated by the Texarkana and Fort Smith Railway Company, and to authorize the latter company to maintain said bridge over said water way, subject to certain stipulations and conditions.

To authorize a survey for construction of a bridge across the eastern branch of the Potomac river in line with Massachusetts Avenue extended eastward.

Authorizing the construction of a bridge over the Mississippi river to the city of St. Louis, in the State of Missouri, from some suitable point between the north line of St. Clair County, Illinois, and the southwest line of said county.

To authorize the construction by the Kansas City, Shreveport, and Gulf Railroad Company of a bridge across the Sabine river between the States of Louisiana and Texas.

To authorize the construction of a bridge over the Monongahela river from the city of McKeesport to the township of Mifflin, Alleghany County, Pa.

Extending the time for the completion of the bridge across the East river, between the city of New York and Long Island, now in course of construction, as authorized by the act of Congress approved March 3, 1887.

To authorize the construction of a bridge across the Yazoo river at or near the city of Greenwood, in Leflore County, in the State of Mississippi.

To establish railroad bridges across the Cumberland and Tennessee rivers in Kentucky.

Authorizing the construction of a bridge across the Columbia river, in the State of Washington.

To authorize the construction or acquisition of a bridge across the Rio Grande river at El Paso, in the State of Texas.

To amend an act entitled "An Act to authorize the Chattanooga Western Railway Company to construct a bridge across the Tennessee river near Chattanooga," giving the said company more time in which to begin and complete said bridge.

To repeal so much of chapter 189 of the Statutes of the United States of America, passed at the third session of the Fifty-third Congress, and approved March 2, 1895, as requires that the lower portion of the Rock Island bridge shall not be occupied by any street railway company without paying a reasonable rent therefor.

To repeal chapter 1061, Fiftieth Congress, approved Oct. 1, 1888, being an act to grant right of way through the military reservation at Fort Morgan to the Birmingham, Mobile and Navy Cove Harbor Railway Company, and for other purposes.

Relating to the improvement of East Chester creek, State of New York.

To amend an act authorizing the West Braddock Bridge Company to construct a bridge over the Monongahela river from the borough of Rankin to Mifflin township.

To revive and re-enact a law to authorize the Pittsburg, Monongahela and Wheeling Railroad Company to construct a bridge over the Monongahela river.

To authorize the Union Railroad Company to construct and maintain a bridge across the Monongahela river.

To grant to the Hudson Reservoir and Canal Company the right of way through the Gila River Indian Reservation.

To amend section 4 of an act entitled "An Act to define the jurisdiction of the police court of the District of Columbia."

To punish the impersonation of inspectors of the health and other departments of the District of Columbia.

Authorizing the commissioners of the District of Columbia to charge a fee for the issuance of transcripts from the records of the health department.

To extend North Capitol Street northward through the property of the Prospect Hill Cemetery, to pay for land taken for such purpose, and for other purposes.

To authorize the construction by the Duluth and North Dakota Railroad Company of two bridges across the Red River of the North between the States of Minnesota and North Dakota.

For the relief of farmers and truckmen in the city of Washington, D. C.

To prevent the spread of contagious diseases in the District of Columbia.

Regulating fraternal beneficiary societies, orders, or associations in the District of Columbia.

To cure the title to certain real estate in the District of Columbia.

Declaring the Potomac Flats a public park, under the name of Potomac Park.

To remove doubts as to the power of the Supreme Court of the District of Columbia to provide for a vacancy in the office of attorney of the United States for the district of Columbia.

For the removal of snow and ice from the sidewalks, cross walks, and gutters in the District of Columbia, and for other purposes.

To amend an act entitled "An Act to prohibit the interment of bodies in Graceland Cemetery, in the District of Columbia," passed Aug. 3, 1884.

To authorize the extension of the lines of the Metropolitan Railroad Company, of the District of Columbia.

Conferring jurisdiction upon the Supreme Court of the District of Columbia, or any court in said district having general equity jurisdiction, to decree a sale of real estate in said district belonging to insane persons for purpose of reinvestment, and for other purposes.

To provide for the payment of certain claims against the District of Columbia by drawback certificates.

The Fifty-fifth Congress.—There was a special session of the Senate March 4, 1897, and Vice-President Hobart, who had taken the oath of office at the close of the last regular session of the Fifty-fourth Congress, took the chair. He said:

"Senators, to have been elected to preside over

the Senate of the United States is a distinction which any citizen would prize, and the manifestation of confidence which it implies is an honor which I sincerely appreciate.

"My gratitude and loyalty to the people of the country, to whom I owe this honor, and my duty to you, as well, demand such a conservative, equitable, and conscientious construction and enforcement of your rules as shall promote the well-being and prosperity of the people, and at the same time conserve the time-honored precedents and established traditions which have contributed to make this tribunal the most distinguished of the legislative bodies of the world.

"In entering upon the duties of the office to which I have been chosen, I feel a peculiar delicacy, for I am aware that your body, with whom, for a time, I will be associated, has had but a small voice in the selection of its presiding officer, and that I am called upon to conduct your deliberations, while not perhaps your choice in point of either merit or fitness.

"It will be my constant effort to aid you, so far as I may, in all reasonable expedition of the business of the Senate, and I may be permitted to express the belief that such expedition is the hope of the country. All the interests of good government and the advancement toward a higher and better condition of things call for prompt and positive legislation at your hands. To obstruct the regular course of wise and prudent legislative action after the fullest and freest discussion is neither consistent with true senatorial courtesy, conducive to the welfare of the people, nor in compliance with their just expectations.

"While assisting in the settlement of the grave questions which devolve upon the Senate of the United States it will be my endeavor to so guide its deliberations that its wisdom may be fruitful in works, at the same time exercising such fairness and impartiality within the rules of the Senate as shall deserve at least your good opinion for the sincerity of my effort.

"Unfamiliar with your rules and manner of procedure, I can only promise that I will bring all the ability I possess to the faithful discharge of every duty as it may devolve upon me, relying always upon your suggestions, your advice, and your co-operation, and I should feel unequal to the task did I not trustfully anticipate that indulgent aid and consideration which you have at all times given to my predecessors, and without which I could not hope to acquit myself to your satisfaction or with any degree of personal credit.

"It shall be my highest aim to justify the confidence the people have reposed in me by discharging my duties in such a manner as to lighten your labors, secure your appreciation of my honest effort to administer your rules with an eye single to the public good, and promote the pleasant and efficient transaction of the public business.

"I trust that our official and personal relations may be alike agreeable; that the friendships we may form here may be genuine and lasting, and that the work of the Senate may redound to the peace and honor of the country and the prosperity and happiness of all the people."

After roll call the ceremony of inauguration began; and the President-elect, having taken the oath of office, delivered the following inaugural address:

"Fellow-citizens: In obedience to the will of the people and in their presence, by the authority vested in me by this oath I assume the arduous and responsible duties of President of the United States, relying on the support of my countrymen and invoking the guidance of Almighty God. Our faith teaches that there is no safer reliance than upon the God of our fathers, who has so singularly

avored the American people in every national trial, and who will not forsake us so long as we obey his commandments and walk humbly in his footsteps.

"The responsibilities of the high trust to which I have been called—always of grave importance—are augmented by the prevailing business conditions, entailing idleness upon willing labor and loss to useful enterprises. The country is suffering from industrial disturbances from which speedy relief must be had. Our financial system needs some revision; our money is all good now, but its value must not further be threatened. It should all be put upon an enduring basis, not subject to easy attack, nor its stability to doubt or dispute. Our currency should continue under the supervision of the Government. The several forms of our paper money offer, in my judgment, a constant embarrassment to the Government and a safe balance in the Treasury. Therefore I believe it necessary to devise a system which, without diminishing the circulating medium or offering a premium for its contraction, will present a remedy for those arrangements which, temporary in their nature, might well in the years of our prosperity have been displaced by wiser provisions. With adequate revenue secured, but not until then, we can enter upon such changes in our fiscal laws as will, while insuring safety and volume to our money, no longer impose upon the Government the necessity of maintaining so large a gold reserve, with its attendant and inevitable temptations to speculation. Most of our financial laws are the outgrowth of experience and trial, and should not be amended without investigation and demonstration of the wisdom of the proposed changes. We must be both 'sure we are right' and 'make haste slowly.' If, therefore, Congress in its wisdom shall deem it expedient to create a commission to take under early consideration the revision of our coinage, banking, and currency laws, and give them that exhaustive, careful, and dispassionate examination that their importance demands, I shall cordially concur in such action. If such power is vested in the President, it is my purpose to appoint a commission of prominent, well-informed citizens of different parties, who will command public confidence both on account of their ability and special fitness for the work. Business experience and public training may thus be combined, and the patriotic zeal of the friends of the country be so directed that such a report will be made as to receive the support of all parties, and our finances cease to be the subject of mere partisan contention. The experiment is, at all events, worth a trial, and, in my opinion, it can but prove beneficial to the entire country.

"The question of international bimetalism will have early and earnest attention. It will be my constant endeavor to secure it by co-operation with the other great commercial powers of the world. Until that condition is realized when the parity between our gold and silver money springs from and is supported by the relative value of the two metals, the value of the silver already coined and of that which may hereafter be coined must be kept constantly at par with gold by every resource at our command. The credit of the Government, the integrity of its currency, and the inviolability of its obligations must be preserved. This was the commanding verdict of the people, and it will not be unheeded.

"Economy is demanded in every branch of the Government at all times, but especially in periods, like the present, of depression in business and distress among the people. The severest economy must be observed in all public expenditures, and ex-

travagance stopped wherever it is found, and prevented wherever in the future it may be developed. If the revenues are to remain as now, the only relief that can come must be from decreased expenditures. But the present must not become the permanent condition of the Government. It has been our uniform practice to retire, not increase, our outstanding obligations, and this policy must again be resumed and vigorously enforced. Our revenues should always be large enough to meet with ease and promptness not only our current needs and the principal and interest of the public debt, but to make proper and liberal provision for that most deserving body of public creditors, the soldiers and sailors and the widows and orphans who are the pensioners of the United States.

"The Government should not be permitted to run behind or increase its debt in times like the present. Suitably to provide against this is the mandate of duty—the certain and easy remedy for most of our financial difficulties. A deficiency is inevitable so long as the expenditures of the Government exceed its receipts. It can only be met by loans or an increased revenue. While a large annual surplus of revenue may invite waste and extravagance, inadequate revenue creates distrust and undermines public and private credit. Neither should be encouraged. Between more loans and more revenue there ought to be but one opinion. We should have more revenue, and that without delay, hindrance, or postponement. A surplus in the Treasury created by loans is not a permanent or safe reliance. It will suffice while it lasts, but it can not last long while the outlays of the Government are greater than its receipts, as has been the case during the past two years. Nor must it be forgotten that however much such loans may temporarily relieve the situation, the Government is still indebted for the amount of the surplus thus accrued, which it must ultimately pay, while its ability to pay is not strengthened, but weakened by a continual deficit. Loans are imperative in great emergencies to preserve the Government or its credit, but a failure to supply needed revenue in time of peace for the maintenance of either has no justification.

"The best way for the Government to maintain its credit is to pay as it goes—not by resorting to loans, but by keeping out of debt—through an adequate income secured by a system of taxation, external or internal, or both. It is the settled policy of the Government, pursued from the beginning and practiced by all parties and administrations, to raise the bulk of our revenue from taxes upon foreign productions entering the United States for sale and consumption, and avoiding, for the most part, every form of direct taxation, except in time of war. The country is clearly opposed to any needless additions to the subjects of internal taxation, and is committed by its latest popular utterance to the system of tariff taxation. There can be no misunderstanding, either, about the principle upon which this tariff taxation shall be levied. Nothing has ever been made plainer at a general election than that the controlling principle in the raising of revenue from duties on imports is zealous care for American interests and American labor. The people have declared that such legislation should be had as will give ample protection and encouragement to the industries and the development of our country. It is, therefore, earnestly hoped and expected that Congress will, at the earliest practicable moment, enact revenue legislation that shall be fair, reasonable, conservative, and just, and which, while supplying sufficient revenue for public purposes, will still be signally beneficial and helpful to every section and every enterprise of the people. To this policy we are all, of whatever par-

ty, firmly bound by the voice of the people—a power vastly more potential than the expression of any political platform. The paramount duty of Congress is to stop deficiencies by the restoration of that protective legislation which has always been the firmest prop of the Treasury. The passage of such a law or laws would strengthen the credit of the Government both at home and abroad, and go far toward stopping the drain upon the gold reserve held for the redemption of our currency, which has been heavy and well-nigh constant for several years.

"In the revision of the tariff especial attention should be given to the re-enactment and extension of the reciprocity principle of the law of 1890, under which so great a stimulus was given to our foreign trade in the new and advantageous markets for our surplus agricultural and manufactured products. The brief trial given this legislation amply justifies a further experiment and additional discretionary power in the making of commercial treaties, the end in view always to be the opening up of new markets for the products of our country, by granting concessions to the products of other lands that we need and can not produce ourselves, and which do not involve any loss of labor to our own people, but tend to increase their employment.

"The depression of the past four years has fallen with especial severity upon the great body of toilers of the country, and upon none more than the holders of small farms. Agriculture has languished and labor suffered. The revival of manufacturing will be a relief to both. No portion of our population is more devoted to the institutions of free government nor more loyal in their support, while none bears more cheerfully or fully its proper share in the maintenance of the Government or is better entitled to its wise and liberal care and protection. Legislation helpful to producers is beneficial to all. The depressed condition of industry on the farm and in the mine and factory has lessened the ability of the people to meet the demands upon them, and they rightfully expect that not only a system of revenue shall be established that will secure the largest income with the least burden, but that every means will be taken to decrease, rather than increase, our public expenditure. Business conditions are not the most promising. It will take time to restore the prosperity of former years. If we can not promptly attain it, we can resolutely turn our faces in that direction and aid its return by friendly legislation. However troublesome the situation may appear, Congress will not, I am sure, be found lacking in disposition or ability to relieve it as far as legislation can do so. The restoration of confidence and the revival of business, which men of all parties so much desire, depend more largely upon the prompt, energetic, and intelligent action of Congress than upon any other single agency affecting the situation.

"It is inspiring, too, to remember that no great emergency in the one hundred and eight years of our eventful national life has ever arisen that has not been met with wisdom and courage by the American people, with fidelity to their best interests and highest destiny, and to the honor of the American name. These years of glorious history have exalted mankind and advanced the cause of freedom throughout the world and immeasurably strengthened the precious free institutions which we enjoy. The people love and will sustain these institutions. The great essential to our happiness and prosperity is that we adhere to the principles upon which the Government was established and insist upon their faithful observance.

"Equality of rights must prevail and our laws be always and everywhere respected and obeyed. We

may have failed in the discharge of our full duty as citizens of the great republic, but it is consoling and encouraging to realize that free speech, a free press, free thought, free schools, the free and unmolested right of religious liberty and worship, and free and fair elections are dearer and more universally enjoyed to-day than ever before. These guarantees must be sacredly preserved and wisely strengthened. The constituted authorities must be cheerfully and vigorously upheld. Lynching must not be tolerated in a great and civilized country like the United States, courts—not mobs—must execute the penalties of the law. The preservation of public order, the right of discussion, the integrity of our courts, and the orderly administration of justice must continue forever the rock of safety upon which our Government securely rests.

"One of the lessons taught by the late election, which all can rejoice in, is that the citizens of the United States are both a law-respecting and law-abiding people, not easily swerved from the path of patriotism and honor. This is in entire accord with the genius of our institutions, and but emphasizes the advantages of inculcating even a greater love for law and order in the future. Immunity should be granted to none who violate the laws, whether individuals, corporations, or communities; and as the Constitution imposes upon the President the duty of both its own execution and of the statutes enacted in pursuance of its provisions, I shall endeavor carefully to carry them into effect. The declaration of the party now restored to power has been in the past that of 'opposition to all combinations of capital organized in trusts, or otherwise to control arbitrarily the condition of trade among our citizens,' and it has supported 'such legislation as will prevent the execution of all schemes to oppress the people by undue charges on their supplies, or by unjust rates for the transportation of their products to market.' This purpose will be steadily pursued, both by the enforcement of the laws now in existence and the recommendation and support of such new statutes as may be necessary to carry it into effect.

"Our naturalization and immigration laws should be further improved to the constant promotion of a safer, a better, and a high citizenship. A grave peril to the republic would be a citizenship too ignorant to understand, or too vicious to appreciate the great value and beneficence of our institutions and laws, and against all who come here to make war upon them our gates must be promptly and tightly closed. Nor must we be unmindful of the need of improvement among our own citizens, but with the zeal of our forefathers encourage the spread of knowledge and free education. Illiteracy must be banished from the land if we shall attain that high destiny as the foremost of the enlightened nations of the world, which under Providence we ought to achieve.

"Reforms in the civil service must go on. But the changes should be real and genuine, not perfunctory or prompted by a zeal in behalf of any party simply because it happens to be in power. As a member of Congress I voted and spoke in favor of the present law, and I shall attempt its enforcement in the spirit in which it was enacted. The purpose in view was to secure the most efficient service of the best men who would accept appointment under Government, retaining faithful and devoted public servants in office, but shielding none, under the authority of any rule or custom, who are inefficient, incompetent, or unworthy. The best interests of the country demand this, and the people heartily approve the law wherever and whenever it has been thus administered.

"Congress should give prompt attention to the

restoration of our American merchant marine, once the pride of the seas in all the great ocean highways of commerce. To my mind few more important subjects so imperatively demand its intelligent consideration. The United States has progressed with marvelous rapidity in every field of enterprise and endeavor until we have become foremost in nearly all the great lines of inland trade, commerce, and industry. Yet, while this is true, our American merchant marine has been steadily declining until it is now lower both in the percentage of tonnage and the number of vessels employed than it was prior to the civil war. Commendable progress has been made of late years in the upbuilding of the American navy, but we must supplement these efforts by providing as a proper consort for it a merchant marine amply sufficient for our own carrying trade to foreign countries. The question is one that appeals both to our business necessities and the patriotic aspirations of a great people.

"It has been the policy of the United States since the foundation of the Government to cultivate relations of peace and amity with all the nations of the world, and this accords with my conception of our duty now. We have cherished the policy of non-interference with the affairs of foreign governments wisely inaugurated by Washington, keeping ourselves free from entanglement either as allies or foes, content to leave undisturbed with them the settlement of their own domestic concerns. It will be our aim to pursue a firm and dignified foreign policy, which shall be just, impartial, ever watchful of our national honor, and always insisting on the enforcement of the lawful rights of American citizens everywhere. Our diplomacy should seek nothing more and accept nothing less than is due us. We want no wars of conquest; we must avoid the temptation of territorial aggression. War should never be entered upon until every agency of peace has failed; peace is preferable to war in almost every contingency.

"Arbitration is the true method of settlement of international as well as local or individual differences. It was recognized as the best means of adjustment of differences between employers and employees by the Forty-ninth Congress, in 1886, and its application was extended to our diplomatic relations by the unanimous concurrence of the Senate and House of the Fifty-first Congress in 1890. The latter resolution was accepted as the basis of negotiations with us by the British House of Commons in 1893, and upon our invitation a treaty of arbitration between the United States and Great Britain was signed at Washington and transmitted to the Senate for its ratification in January last. Since this treaty is clearly the result of our own initiative; since it has been recognized as the leading feature of our foreign policy throughout our entire national history—the adjustment of difficulties by judicial methods rather than by force of arms; and since it presents to the world the glorious example of reason and peace, not passion and war, controlling the relations between two of the greatest nations of the world, an example certain to be followed by others, I respectfully urge the early action of the Senate thereon, not merely as a matter of politics, but duty to mankind. The importance and moral influence of the ratification of such a treaty can hardly be overestimated in the cause of advancing civilization. It may well engage the best thought of the statesmen and people of every country, and I can not but consider it fortunate that it was reserved to the United States to have the leadership in so grand a work.

"It has been the uniform practice of the President to avoid, as far as possible, the convening of Congress in extraordinary session. It is an exam-

ple which, under ordinary circumstances and in the absence of a public necessity, is to be commended, but a failure to convene the representatives of the people in Congress in extra session when it involves a public duty, places a responsibility of such neglect upon the Executive himself. The condition of the public treasury, as has been indicated, demands the attention of Congress. It alone has the power to provide revenue for the Government. Not to convene it under such circumstances, I can view in no other sense than the neglect of a plain duty. I do not sympathize with the sentiment that Congress in session is dangerous to our business interests. Its members are the agents of the people, and their presence at the seat of Government in the execution of the sovereign will should not operate as an injury, but a benefit. There could be no better time to put the Government upon a sound and economical basis than now. The people have only recently voted that this should be done, and nothing is more binding upon the agents of their will than the obligation of immediate action. It has always seemed to me that the postponement of the meetings of Congress until more than a year after it has been chosen deprived Congress too often of the inspiration of the popular will and the country of the corresponding benefits. It is evident, therefore, that to postpone action in the presence of so great a necessity would be unwise on the part of the Executive because unjust to the interests of the people. Our actions now will be freer from mere partisan consideration than if the question of tariff revision was postponed until the reorganization of Congress. We are nearly two years from a congressional election, and politics can not so greatly distract us as if such contest was immediately pending. We can approach the problem calmly and patriotically, without fearing its effect upon an early election. Our fellow-citizens who may disagree with us upon the character of this legislation prefer to have the question settled now, even against their preconceived views—and perhaps settled so reasonably, as I trust and believe it will, to insure great permanence—than to have further uncertainty menacing the varied business interests of the United States. Again, whatever action Congress may take will be given a fair opportunity for trial before the people are called to pass judgment on it, and this I consider a great essential to the rightful and lasting settlement of the question. In view of these considerations I shall deem it my duty as President to convene Congress in extraordinary session on Monday, the 15th day of March, 1897.

In conclusion, I congratulate the country upon the fraternal spirit of the people and the manifestation of good will everywhere so apparent. The recent election not only most fortunately demonstrated the obliteration of sectional or geographical lines, but to some extent also the prejudices which for years have distracted our councils and marred our true greatness as a nation. The triumph of the people, whose verdict is carried into effect to-day, is not the triumph of one section, nor wholly of one party, but of all sections and all the people. The North and the South no longer divide on the old lines, but upon principles and policies; and in this fact surely every lover of the country can find cause for true felicitation. Let us rejoice in and cultivate this spirit; it is ennobling, and will be both a gain and blessing to our beloved country. It will be my constant aim to do nothing, and permit nothing to be done, that will arrest or disturb this growing sentiment of unity and co-operation, this revival of esteem and affiliation which now animates so many thousands in both the old antagonistic sections, but I shall cheerfully do everything possible to promote and increase it.

"Let me again repeat the words of the oath administered by the Chief Justice, which, in their respective spheres, so far as applicable, I would have all my countrymen observe: 'I will faithfully execute the office of President of the United States, and will, to the best of my ability, preserve, protect, and defend the Constitution of the United States.' This is the obligation I have reverently taken before the Lord Most High. To keep it will be my single purpose, my constant prayer; and I shall confidently rely upon the forbearance and assistance of all the people in the discharge of my solemn responsibilities."

March 5 the Senate confirmed the Cabinet appointments; and March 6 the President issued a proclamation for an extra session of the Congress to assemble March 15, 1897.

On that day the first session of the Fifty-fifth Congress began.

The Senate was composed as follows, the date given with each name indicating the close of the term:

<i>Alabama.</i>		<i>Massachusetts.</i>	
1901. John T. Morgan, D.	1899. Henry C. Lodge, R.	1901. George F. Hoar, R.	
1903. Edmund W. Pettus, D.			
<i>Arkansas.</i>		<i>Michigan.</i>	
1901. James H. Berry, D.	1899. Julius C. Burrows, R.	1901. James McMillan, R.	
1903. James K. Jones, D.			
<i>California.</i>		<i>Minnesota.</i>	
1899. Stephen M. White, D.	1899. Cushman K. Davis, R.	1901. Knute Nelson, R.	
1903. George C. Perkins, R.			
<i>Colorado.</i>		<i>Mississippi.</i>	
1901. Edward O. Wolcott, R.	1899. James Z. George, D.	1901. Edward C. Walthall, D.	
1903. Henry M. Teller, R.			
<i>Connecticut.</i>		<i>Missouri.</i>	
1899. Joseph R. Hawley, R.	1899. Francis M. Cockrell, D.	1903. George G. Vest, D.	
1903. Orville H. Platt, R.			
<i>Delaware.</i>		<i>Montana.</i>	
1899. George Grav, D.	1899. Lee Mantle, R.	1901. Thomas H. Carter, R.	
1901. Richard R. Kenney, D.			
<i>Florida.</i>		<i>Nebraska.</i>	
1899. Samuel Pasco, D.	1899. William V. Allen, P.	1901. John M. Thurston, R.	
1903. Stephen R. Mallory, D.			
<i>Georgia.</i>		<i>Nevada.</i>	
1901. Augustus O. Bacon, D.	1899. William M. Stewart, P.	1903. John P. Jones, P.	
1903. Alex. Stephens Clay, D.			
<i>Idaho.</i>		<i>New Hampshire.</i>	
1901. George L. Shoup, R.	1901. William E. Chandler, R.	1903. Jacob H. Gallinger, R.	
1903. Henry Heitfield, R.			
<i>Illinois.</i>		<i>New Jersey.</i>	
1901. Shelby M. Cullom, R.	1899. James Smith, Jr., D.	1901. William J. Sewell, R.	
1903. William E. Mason, R.			
<i>Indiana.</i>		<i>New York.</i>	
1899. David Turpie, D.	1899. Edward Murphy, Jr., D.	1903. Thomas C. Platt, R.	
1903. Chas. W. Fairbanks, R.			
<i>Iowa.</i>		<i>North Carolina.</i>	
1901. John H. Gear, R.	1901. Marion Butler, P.	1903. Jeter C. Pritchard, F.	
1903. William B. Allison, R.			
<i>Kansas.</i>		<i>North Dakota.</i>	
1901. Lucien Baker, R.	1899. William N. Roach, D.	1903. H. C. Hansbrough, R.	
1903. William A. Harris, P.			
<i>Kentucky.</i>		<i>Ohio.</i>	
1901. William Lindsay, D.	1899. Marcus A. Hanna, R.*	1903. Joseph B. Foraker, R.	
1903. William J. Deboe, R.			
<i>Louisiana.</i>		<i>Oregon.</i>	
1901. Donelson Caffery, D.	1901. George W. McBride, R.		
1903. Samuel D. McEnery, D.			
<i>Maine.</i>		<i>Pennsylvania.</i>	
1899. Eugene Hale, R.	1899. Matthew S. Quay, R.	1903. Boies Penrose, R.	
1901. William P. Frye, R.			
<i>Maryland.</i>		<i>Rhode Island.</i>	
1899. Arthur P. Gorman, D.	1899. Nelson W. Aldrich, R.	1901. George P. Wetmore, R.	
1903. Geo. L. Wellington, R.

The Territorial Delegates were as follow:

Arizona—Marcus A. Smith, D.
New Mexico—H. B. Ferguson, D.
Oklahoma—T. Y. Callahan, F.

After the roll call the House proceeded to the election of Speaker, and Thomas B. Reed, of Maine, was chosen by a vote of 200, to 114 for Joseph W. Bailey, of Texas, 21 for John C. Bell, of Colorado, and 1 for Francis G. Newlands, of Nevada.

On taking the chair, Mr. Reed said:

"Gentlemen of the House of Representatives, it has been the custom for more than a century for Speakers-elect to so fully express their gratitude and their sense of honor conferred that the language by which thanks are conveyed has been long ago exhausted. Will you pardon me if I confess that on all the occasions when I have stood here I have been more impressed by the sense of responsibility than cheered by the sentiment of thankfulness?"

"Yet I appreciate—no man more—the high honor of your vote and the confidence which has dictated it. But high as the honor is, it will surely fade unless your favor is permanent. I can not, having had experience, expect to please all of you always; but I do hope, with your kind assistance and your kinder forbearance, to administer justice to each member and to both sides of the Chamber, under the rules established by the House of Representatives, without fear, favor, or the hope of reward."

Alexander McDowell, of Pennsylvania, was then chosen Clerk; Benjamin F. Russell, of Missouri, Sergeant-at-Arms; William J. Glenn, of New York, Doorkeeper; Joseph C. McElroy, of Ohio, Postmaster; and Henry M. Couden, of Michigan, Chaplain.

The President, being notified that the Congress was organized and ready for business, sent in the following message:

To the Congress of the United States:

Regretting the necessity which has required me to call you together, I feel that your assembling in extraordinary session is indispensable because of the condition in which we find the revenues of the Government. It is conceded that its current expenditures are greater than its receipts, and that such a condition has existed for now more than three years. With unlimited means at our command, we are presenting the remarkable spectacle of increasing our public debt by borrowing money to meet the ordinary outlays incident upon even an economical and prudent administration of the Government. An examination of the subject discloses this fact in every detail and leads inevitably to the conclusion that the condition of the revenue which allows it is unjustifiable and should be corrected.

We find by the reports of the Secretary of the Treasury that the revenues for the fiscal year ending June 30, 1892, from all sources were \$425,868,260.22, and the expenditures for all purposes were \$415,953,806.56, leaving an excess of receipts over expenditures of \$9,914,453.66. During that fiscal year \$40,570,467.98 were paid upon the public debt, which had been reduced since March 1, 1889, \$259,076.890, and the annual interest charge decreased \$11,684,576.60. The receipts of the Government from all sources during the fiscal year ending June 30, 1893, amounted to \$461,716,561.94, and its expenditures to \$459,374,887.65, showing an excess of receipts over expenditures of \$2,341,674.29.

Since that time the receipts of no fiscal year, and, with but few exceptions, of no month of any fiscal year, have exceeded the expenditures. The receipts of the Government from all sources during the fiscal year ending June 30, 1894, were \$372,802,408.29, and its expenditures \$442,605,758.87, leaving a deficit, the first since the resumption of specie payments, of \$69,803,350.58. Notwithstanding there was a decrease of \$16,760,128.78 in the ordinary expenses of the Government, as compared with the previous fiscal year, its income was still not sufficient to provide for its daily necessities, and the gold reserve in the Treasury for the redemption of greenbacks was drawn upon to meet them. But this did not suffice, and the Government then resorted to loans to replenish the reserve.

In February, 1894, \$50,000,000 in bonds were issued, and in November following a second issue of \$50,000,000 was deemed necessary. The sum of \$117,171,795 was realized by the sale of these bonds, but the reserve was steadily decreased until, on Feb. 8, 1895, a third sale of \$62,315,400 in bonds, for \$65,116,244, was announced to Congress.

The receipts of the Government for the fiscal year ending June 30, 1895, were \$390,373,203.30, and the expenditures \$433,178,426.48, showing a deficit of \$42,805,223.18. A further loan of \$100,000,000 was negotiated by the Government in February, 1896, the sale netting \$111,166,246, and swelling the aggregate of bonds issued within three years to \$262,315,400. For the fiscal year ending June 30, 1896, the revenues of the Government from all sources amounted to \$409,475,408.78, while its expenditures were \$434,678,654.48, or an excess of expenditures over receipts of \$25,203,245.70. In other words, the total receipts for the three fiscal years ending June 30, 1896, were insufficient by \$137,811,729.46 to meet the total expenditures.

Nor has this condition since improved. For the first half of the present fiscal year the receipts of the Government, exclusive of postal revenues, were \$157,507,603.76, and its expenditures, exclusive of postal service, \$195,410,000.22, or an excess of expenditures over receipts of \$37,902,396.46. In January of this year the receipts, exclusive of postal revenues, were \$24,316,994.05, and the expenditures, exclusive of postal service, \$30,269,389.29, a deficit of \$5,952,395.24 for the month. In February of this year the receipts, exclusive of postal revenues, were \$24,400,997.38, and expenditures, exclusive of postal service, \$28,796,056.66, a deficit of \$4,395,059.28, or a total deficiency of \$186,061,580.44 for the three years and eight months ending March 1, 1897. Not only are we without a surplus in the Treasury, but, with an increase in the public debt, there has been a corresponding increase in the annual interest charge from \$22,893,883.20 in 1892, the lowest of any year since 1862, to \$34,387,297.60 in 1896, or an increase of \$11,493,414.40.

It may be urged that even if the revenues of the Government had been sufficient to meet all its ordinary expenses during the past three years, the gold reserve would still have been insufficient to meet the demands upon it, and that bonds would necessarily have been issued for its repletion. Be this as it may, it is clearly manifest, without denying or affirming the correctness of such a conclusion, that the debt would have been decreased in at least the amount of the deficiency, and business confidence immeasurably strengthened throughout the country.

Congress should promptly correct the existing condition. Ample revenues must be supplied not only for the ordinary expenses of the Government, but for the prompt payment of liberal pensions and the liquidation of the principal and interest of the public debt. In raising revenue, duties should be

so levied upon foreign products as to preserve the home market, so far as possible, to our own producers; to revive and increase manufactures; to relieve and encourage agriculture; to increase our domestic and foreign commerce; to expand and develop mining and building; and to render to labor in every field of useful occupation the liberal wages and adequate rewards to which skill and industry are justly entitled. The necessity of the passage of a tariff law which shall provide ample revenue need not be further urged. The imperative demand of the hour is the prompt enactment of such a measure, and to this object I earnestly recommend that Congress shall make every endeavor. Before other business is transacted let us first provide sufficient revenue to faithfully administer the Government without the contracting of further debt or the continued disturbance of our finances.

WILLIAM MCKINLEY.

EXECUTIVE MANSION, March 15, 1897.

The Tariff Act.—Mr. Dingley, of Maine, introduced a tariff bill on the day the Congress assembled, and on March 19 a measure was reported from the Committee on Ways and Means. The same day the Committee on Rules submitted a privileged report, providing for the discussion of the measure and rapid action. It set Monday, March 22, as the day for opening debate in committee of the whole, and required sessions from ten o'clock in the morning to five in the afternoon and from eight to eleven in the evening, the general debate to close at that hour on Thursday, March 25; it arranged for a discussion of the measure by paragraphs until March 31 at three o'clock in the afternoon, when the measure was to be put on its passage. The special rule was adopted after a short discussion by a vote of 180 yeas to 132 nays.

The debate on the measure in the House and in the Senate was so voluminous that a summary would be out of the question; and the speeches were in the main along the old lines of argument opened up in the first Congress, reiterated at various periods since, and spun out to wearisome length within recent years.

It may be worth while, however, to present in brief the special point as to the necessity for tariff legislation in order to increase the revenue to meet excess of expenditure.

Mr. Dingley said: "Congress has been convened in extraordinary session by the President for the purpose of providing adequate revenue for carrying on the Government. The exigency which has brought us here is so clearly stated in the message of the President, and is so fully recited in the report of the Committee on Ways and Means submitting the pending revision of the tariff for the consideration of the House, that I need not detain you repeating the story so completely within your own knowledge. The salient facts are these:

"1. In the four fiscal years commencing July 1, 1893, and closing on the 30th of June next, the revenue of the Government has been insufficient to meet the expenditures to the extent of more than \$200,000,000, or an average of \$50,000,000 per annum.

Deficiency fiscal year ended June 30—

1894	\$69,803,350
1895	42,805,223
1896	25,203,245
1897 (estimated)	62,000,000

Total deficiency..... \$200,000,000

"2. The late Secretary of the Treasury, in his last annual report, estimates that under existing conditions this deficiency will continue, and will reach \$45,000,000 more the next fiscal year.

"3. This deficiency of \$200,000,000 up to the close of the present fiscal year has been met by borrow-

ing; that is, of the two hundred and ninety-three and a half millions realized from the sale of two hundred and sixty-two and one third million bonds sold, in the last analysis over two hundred millions has been used to pay current expenditures in excess of revenue.

"4. This chronic deficiency of revenue and the use of the borrowed reserve, or (what is the same thing) of the United States demand notes, redeemed with gold obtained by borrowing, has promoted distrust, intensified and prolonged the run on the Treasury, and weakened business confidence.

"5. This deficiency of revenue has nearly all arisen from the falling off of revenue from duties on imports (and not from a decline of revenue from internal taxes) since the results of the national election in November, 1892, first forecasting and subsequently partially accomplishing a revolutionary change of tariff policy, began to arrest industries. In the fiscal year beginning July 1, 1892, the revenue derived from the duties on imports was two hundred and three millions, an increase of twenty-six millions over the previous year, and up to November, 1892, it was the confident expectation of the then Secretary of the Treasury that the revenue in the succeeding fiscal year would reach two hundred and twenty millions; but this expectation was blasted when anticipated tariff legislation that would largely reduce duties began to defer importations and subsequently to disorganize industries.

"The revenue derived from duties on imports and also from internal-revenue taxes for each fiscal year, beginning with 1892, was as follows:

YEAR.	From customs.	From internal revenue.
1892	\$177,452,964	\$159,971,073
1893	203,355,016	161,027,624
1894	131,818,530	147,111,293
1895	152,158,617	143,421,672
1896	160,021,751	146,762,864
1897 (estimated).....	140,000,000	150,000,000

"In the light of this course of events, and in the face of the chronic deficiency requiring immediate relief, the Committee on Ways and Means have reported the pending bill to revise the tariff for the ends indicated by the title, to wit, to provide additional revenue to carry on the Government, and at the same time, in adjusting the duties to secure this revenue, to encourage the industries of the United States.

"In this revision the committee have endeavored to discard mere theories, and have addressed themselves to the framing of a practical remedy, at least in part, for the ills which have for so many months overshadowed the country.

"It is a condition and not a theory which confronts us. Our problem is to provide adequate revenue from duties on imports to carry on the Government, and in imposing duties to secure this result to so adjust them as to secure to our own people the production and manufacture of such articles as we can produce or make for ourselves without natural disadvantage, and thus provide more abundant opportunities for our labor. For rest assured that no economic policy will prove a success unless it shall in some manner contribute to opening up employment to the masses of our people at good wages. When this shall be accomplished, and thus the purchasing power of the masses is restored, then, and not until then, will prices cease to feel the depressing effect of underconsumption, and the prosperity of our people rise to the standard of 1892.

"The great secret of the prosperity of the United States up to 1893, especially after the resumption of specie payments in 1879, was the fact that our people were all at work at good wages, and thus had large

purchasing power. It was this large consuming and purchasing power that made our markets the best in the world, that maintained prices at fair rates—in short, that made this country the admiration and envy of the world.

"When, by first the anticipated and then partially realized overthrow of protection, industries were arrested, machinery stopped, wages reduced, and employees discharged, through the transfer of the producing and making of part of what we had previously made to other lands, then the purchasing power of the masses was diminished and the demand for products decreased, and this gorged the markets, abnormally lowered prices, and prostrated industries and business.

"Mr. Chairman, the past four years have been enlightening, especially to candid investigators of economic problems. We have been attending a kindergarten on a gigantic scale. The tuition has come high, but no people ever learned so much in so brief a time. Hereafter theories, preached in however captivating language, will have to give way to the teachings of experience."

The plea against the necessity for legislation on the ground that the existing tariff would produce sufficient income was put by Mr. Wheeler, of Alabama, as follows:

"Mr. Chairman, from the day of the election of President McKinley up to March 4, the Republican press announced that Congress would be convened immediately upon the inauguration of the newly elected Republican President, the reason being assigned that the deficiency of revenue made it imperatively necessary.

"On March 6, the proclamation for the extraordinary session was issued. The message of the President, which was received the day we convened, was devoted exclusively to an argument which endeavored to prove that the condition of the finances were such that prompt measures to increase the revenue were imperative. The message told us that the expenditures of the Government had exceeded the receipts during the last three years as follows:

Year ending June 30, 1894.....	\$69,803,260.58
Year ending June 30, 1895.....	42,805,223.18
Year ending June 30, 1896.....	25,303,245.70

"This proves that had the income tax, which would have yielded \$40,000,000 annually, not been nullified by the Supreme Court of the United States, the receipts would have far exceeded the expenditures, which fully vindicates the Wilson bill as a revenue measure. It also shows that, notwithstanding the loss of the income tax, the deficit had been constantly decreasing—last year the deficiency being only \$25,203,245.70.

"The message of the President fails to mention the important fact that on the day of his inauguration there was \$212,725,207.74 in the Treasury available for the payment of Government expenditures. This proves that there was no possibility of this fund being exhausted or even seriously reduced until we could in the most orderly way pass revenue measures at the regular session if, indeed, at that time it became apparent that there was a necessity for additional revenue. In that event the large Republican majority in this House could enact some law which would give the necessary revenue without disturbing the general tariff laws of our country. Or if the necessity had been apparent, as contended as early as last November, a bill of that character could have been easily passed during the last session of Congress. The fact that nothing of this character was attempted during the Congress just closed (the last session of the Fifty-fourth Congress) shows very conclusively that other results were sought than to raise revenue.

"This apprehension is strengthened from the fact that for the first time in the history of our Government there is presented to the House of Representatives a revenue bill which confesses in its title that the purpose of the bill is to protect American industries. Even the framers of the famous McKinley bill, which was so severely condemned by the country, did not have the effrontery to incorporate any such expressions in the title of that bill.

"To further show that the condition of the revenue did not make this extraordinary session necessary, I will state that since March 4 the receipts of the Government, so far from being less than expenditures, have very far exceeded them, the excess of receipts over expenditures being as follows:

March 6.....	\$298,096.78	March 17.....	\$257,127.34
March 8.....	26,903.01	March 18.....	960,340.81
March 19.....	427,363.49	March 19.....	98,671.01
March 13.....	293,674.45	March 20.....	74,029.49
March 15.....	919,755.50	March 22.....	302,015.31
March 16.....	2,792,996.87		

"And the report of the Secretary of the Treasury tells us that the amount of money in the Treasury this morning available to pay expenditures is \$218,060,908.78. And yet with these facts staring them in the face, the distinguished chairman of the Committee on Ways and Means, who has just closed his speech, opened the debate in these words:

"Congress has been convened in extraordinary session by the President for the purpose of providing adequate revenue for carrying on the Government."

"But the most astounding feature in all this is yet to be told. The speech of the distinguished chairman of the Ways and Means Committee and the message of President McKinley both insist upon the immediate passage of what is practically the old McKinley bill, for the purpose, as they say, of preventing deficiencies in the revenue, when the fact is staring them in the face that the deficiencies under which we have suffered are due to the very legislation which is insisted upon by them as well as all the Republican members of this House, and when the further fact also stares them in the face that at this time the Wilson bill which they seek to repeal is yielding revenue far in excess of expenditure."

On March 31 the Dingley bill passed the House by the following vote:

YEAS—Acheson, Adams, Alexander, Arnold, Babcock, Baker of Maryland, Barber, Barham, Barney, Barrows, Bartholdt, Beach, Belden, Belford, Belknap, Bennett, Bingham, Bishop, Booz, Boutelle, Brewster, Broderick, Bromwell, Brosius, Broussard, Brown, Brownlow, Brumm, Bull, Burton, Butler, Cannon, Capron, Chickering, Clark of Iowa, Clarke of New Hampshire, Cochrane of New York, Coddling, Colson, Connell, Connolly, Cooke, Cooper of Wisconsin, Corliss, Cousins, Crump, Crumpacker, Curtis of Iowa, Dalzell, Danford, Davenport, Davey, Davidson of Wisconsin, Davison of Kentucky, Dayton, Dingley, Dolliver, Dorr, Dovenor, Eddy, Ellis, Evans, Faris, Fenton, Fischer, Fletcher, Foote, Foss, Fowler of New Jersey, Gardner, Gibson, Gillet of New York, Gillett of Massachusetts, Graff, Griffin, Grosvenor, Grout, Grow, Hager, Hamilton, Harmer, Hawley, Heatwole, Hemenway, Henderson, Henry of Connecticut, Henry of Indiana, Hepburn, Hicks, Hilborn, Hill, Hitt, Hooker, Hopkins, Howard of Alabama, Howe, Howell, Hull, Hurley, Jenkins, Johnson of Indiana, Johnson of North Dakota, Joy, Kerr, Ketcham, Kirkpatrick, Kleberg, Kulp, Lacey, Landis, Linney, Littauer, Lorimer, Loud, Loudenslager, Lovering, Low, Lybrand, McCall, McCleary, McDonald, McEwan, McIntire, Mahany, Mahon, Mann, Marsh, Mercer, Mesick, Meyer of Louisiana, Miller,

Mills, Minor, Mitchell, Mosely, Morris, Mudd, Northway, Odell, Olmsted, Otten, Overstreet, Packer of Pennsylvania, Parker of New Jersey, Payne, Pearce of Missouri, Pearson, Perkins, Pitney, Powers, Prince, Pugh, Quigg, Ray, Reeves, Robbins, Royle, Russell, Sauerbiering, Shattuck, Shattuck, Sheldon, Sherman, Simpkins of Massachusetts, Slayden, Smith of Illinois, S. W. Smith, William Alden Smith, Snover, Southard, Southwick, Spaulding, Sperry, Strague, Steele, Stevens of Minnesota, Stewart of New Jersey, Stewart of Wisconsin, C. W. Stone, W. A. Stone, Strode of Nebraska, Sturtevant, Sulloway, Tawney, Taylor of Ohio, Tongue, Updegraff, Van Voorhis, Wadsworth, Walker of Massachusetts, Walker of Virginia, Wanger, Ward, Warner, Weaver, Weymouth, White of Illinois, White of North Carolina, Wilber, Williams of Pennsylvania, Wilson of New York, Wright, Yost, Young of Pennsylvania, the Speaker—205.

NAYS—Adamson, Allen, Bailey, Baird, Baker of Illinois, Ball, Bankhead, Barlow, Bartlett, Benner, Benton, Berry, Bland, Bodine, Bradley, Brantley, Brenner, Brewer, Brucker, Brundage, Burke, Campbell, Carmack, Castle, Catchings, Clardy, Clark of Missouri, Clayton, Cochran of Missouri, Cooney, Cooper of Texas, Cowherd, Cox, Davis, De Armond, De Graffenreid, De Vries, Dinsmore, Dockery, Elliott, Eges, Ermentrout, Fitzgerald, Fitzpatrick, Fleming, Fox, Gaines, Griggs, Handy, Hay, Henry of Mississippi, Henry of Texas, Hinrichsen, Holman, Howard of Georgia, Hunter, Jett, Jones of Virginia, King, Kitchin, Lamb, Lanham, Latimer, Lentz, Lester, Lewis of Georgia, Little, Livingston, Love, McAleer, McClellan, McCulloch, McDowell, McLaurin, McMillan, McRae, Maddox, Maguire, Marshall, Meekison, Miers of Indiana, Moon, Norton, Ogden, Osborne, Oley, Peters, Pierce of Tennessee, Plowman, Rhea, Richardson, Rixey, Robb, Robertson of Louisiana, Robinson of Indiana, Savers, Settle, Simpson of Kansas, Sims, Smith of Kentucky, Sparkman, Stallings, Stephens of Texas, Stokes, Strait, Sullivan, Sulzer, Swanson, Talbert, Tate, Taylor of Alabama, Terry, Todd, Underwood, Vandiver, Vehalage, Wheeler of Alabama, Wheeler of Kentucky, Williams of Mississippi, Wilson of South Carolina, Young of Virginia, Zenor—122.

ANSWERED "PRESENT"—Bell, Batkin, Fowler of North Carolina, Greene, Gunn, Hartman, Jones of Washington, Kelley, Knowles, McCormick, Martin, Maxwell, Newlands, Ridgely, Shafroth, Shuford, Skinner, Stark, Strowd of North Carolina, Sutherland, Vincent—21.

NOT VOTING—Barrett, Cranford, Cummings, Curtis of Kansas, Knox, Milliken—6.

After a protracted discussion in the Senate and the incorporation of some 872 amendments the measure passed, July 7, by the following vote:

YEAS—Allison, Baker, Burrows, Carter, Clark, Cullom, Davis, Devoe, Elkins, Fairbanks, Foraker, Gallinger, Hale, Hanna, Hawley, Jones of Nevada, Lodge, McBride, McEnery, McMillan, Mantle, Mason, Morrill, Nelson, Penrose, Perkins, Platt of Connecticut, Platt of New York, Pritchard, Proctor, Quay, Sewell, Shoup, Spooner, Warren, Wellington, Wetmore, Wilson—38.

NAYS—Bacon, Bate, Berry, Caffery, Cannon, Chilton, Clay, Cockrell, Faulkner, Gray, Harris of Kansas, Jones of Arkansas, Kenney, Lindsay, Mallory, Martin, Mills, Mitchell, Morgan, Pettus, Rawlins, Roach, Turner, Turpin, Voss, Walthall, White—28.

NOT VOTING—Aldrich, Allen, Butler, Chamberlain, Daniel, Frye, Gear, George, Gorman, Harter, Harris of Tennessee, Heitfeld, Hear, M. L. Harris, Murphy, Pettigrew, Smith, Stewart, Teller, Thurston, Tillman, Wolcott—23.

The House nonconcurrent on the Senate amendments and a conference committee was appointed which reported in favor of a great majority of the Senate amendments. The report was agreed to and the President approved the act July 24, 1897.

The full text of the "Act to provide revenue for the Government and to encourage the industries of the United States" is as follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That on and after the passage of this act unless otherwise specially provided for in this act, there shall be levied, collected, and paid upon all articles imported from foreign countries, and mentioned in the schedules hereinafter contained, the rates of duty which are by the schedules and paragraphs respectively prescribed, namely:

SCHEDULE A.—CHEMICALS, OILS, AND PAINTS.

And, 1. Acetic or pyroigneous acid, not exceeding the specific gravity of one and forty-seven one thousandths, three fourths of one cent per pound; exceeding the specific gravity of one and forty-seven one thousandths, two cents per pound; boric acid, five cents per pound; chromic acid and lactic acid, three cents per pound; citric acid, seven cents per pound; salicylic acid, ten cents per pound; sulphuric acid or oil of vitriol not specially provided for in this act, one fourth of one cent per pound; tannic acid or tannin, fifty cents per pound; gallic acid, ten cents per pound; tartaric acid, seven cents per pound; all other acids not specially provided for in this act, twenty-five per centum ad valorem.

2. All alcoholic perfumery, including cologne water and other toilet waters and toilet preparations of all kinds, containing alcohol or in the preparation of which alcohol is used, and alcoholic compounds not specially provided for in this act, sixty cents per pound and forty-five per centum ad valorem.

3. Alkalies, alkaloids, distilled oils, essential oils, expressed oils, rendered oils, and all combinations of the foregoing, and all chemical compounds and salts not specially provided for in this act, twenty-five per centum ad valorem.

4. Alumina, hydrate of, or refined bauxite, six tenths of one cent per pound; alum, alum cake, patent alum, sulphate of alumina, and aluminous cake, and alum in crystals or ground, one half of one cent per pound.

5. Ammonia, carbonate of, one and one half cent per pound; muriate of, or sal ammoniac, three fourths of one cent per pound; sulphate of, three tenths of one cent per pound.

6. Argols or crude tartar or wine lees crude, containing not more than forty per centum of bitartrate of potash, one cent per pound; containing more than forty per centum of bitartrate of potash, one and one half cent per pound; tartars and lees crystals, or partly refined argols, containing not more than ninety per centum of bitartrate of potash, and tartrate of soda or potassa, or Rochelle salts, four cents per pound; containing more than ninety per centum of bitartrate of potash, five cents per pound; cream of tartar and patent tartar, six cents per pound.

7. Blacking of all kinds, twenty-five per centum ad valorem.

8. Bleaching powder, or chloride of lime, one fifth of one cent per pound.

9. Blue vitriol or sulphate of copper, one half of one cent per pound.

10. Bone char, suitable for use in decolorizing sugars, twenty per centum ad valorem.

11. Borax, five cents per pound; borates of lime or soda, or other borate material not otherwise provided for, containing more than thirty-six per centum of anhydrous boric acid, four cents per pound; borates of lime or soda, or other borate material not otherwise provided for, containing not more than thirty-six per centum of anhydrous boric acid, three cents per pound.

12. Camphor, refined, six cents per pound.

13. Chalk (not medicinal nor prepared for toilet purposes), when ground, precipitated naturally or artificially, or otherwise prepared, whether in the form of cubes, blocks, sticks or disks, or otherwise, including tailors', billiard, red, or French chalk, one cent per pound. Manufactures of chalk not specially provided for in this act, twenty-five per centum ad valorem.

14. Chloroform, twenty cents per pound.

15. Coal-tar dyes or colors, not specially provided for in this act, thirty per centum ad valorem; all other products or preparations of coal tar, not colors or dyes and not medicinal, not specially provided for in this act, twenty per centum ad valorem.

16. Cobalt, oxide of, twenty-five cents per pound.

17. Collodion and all compounds of pyroxylin, whether known as celluloid or by any other name, fifty cents per pound; rolled or in sheets, unpolished, and not made up into articles, sixty cents per pound; if in finished or partly finished articles, and articles of which collodion or any compound of pyroxylin is the component material of chief value, sixty-five cents per pound and twenty-five per centum ad valorem.

18. Coloring for brandy, wine, beer, or other liquors, fifty per centum ad valorem.

19. Cuppers or sulphate of iron, one fourth of one cent per pound.

20. Drugs, such as barks, beans, berries, balsams, buds, bulbs, bulbous roots, exscrencences, fruits, flowers, dried fibers, dried insects, grains, gums and gum resin, herbs, leaves, lichens, mosses, nuts, nutgalls, roots, stems, spices, vegetables, seeds (aromatic, not garden seeds), seeds of morbid growth, weeds, and woods used expressly for dyeing; any of the foregoing which are drugs and not edible, but which are advanced in value or condition by refining, grinding, or other process, and not specially provided for in this act, one fourth of one cent per pound, and in addition thereto ten per centum ad valorem.

21. Ethers: Sulphuric, forty cents per pound; spirits of nitrous ether, twenty-five cents per pound; fruit ethers, oils, or essences, two dollars per pound; ethers of all kinds not specially provided for in this act, one dollar per pound: *Provided*, That no article of this paragraph shall pay a less rate of duty than twenty-five per centum ad valorem.

22. Extracts and decoctions of logwood and other dye-woods, and extracts of barks, such as are commonly used for dyeing or tanning, not specially provided for in this act, seven eighths of one cent per pound; extracts of quebracho and of hemlock bark, one half of one cent per pound; extracts of sumac, and of woods other than dye-woods, not specially provided for in this act, five eighths of one cent per pound.

23. Gelatin, glue, isinglass or fish glue, and prepared fish bladders or fish sounds, valued at not above ten cents per pound, two and one half cents per pound; valued at above ten cents per pound and not above thirty-five cents per pound, twenty-five per centum ad valorem; valued above thirty-five cents per pound, fifteen cents per pound and twenty per centum ad valorem.

24. Glycerin, crude, not purified, one cent per pound; refined, three cents per pound.

25. Indigo, extracts, or pastes of, three fourths of one cent per pound; carmined, ten cents per pound.

26. Ink and ink powders, twenty-five per centum ad valorem.

27. Iodine, resublimed, twenty cents per pound.

28. Iodoform, one dollar per pound.

29. Licorice, extracts of, in paste, rolls, or other forms, four and one half cents per pound.

30. Chicle, ten cents per pound.

31. Magnesia, carbonate of, medicinal, three cents per pound; calcined, medicinal, seven cents per pound; sulphate of, or Epsom salts, one fifth of one cent per pound.

Oils.—32. Alizarin assistant, sulpho-ricinoleic acid, and ricinoleic acid, by whatever name known, whether liquid, solid, or in paste, in the manufacture of which fifty per centum or more of castor oil is used, thirty cents per gallon; in the manufacture of which less than fifty per centum of castor oil is used, fifteen cents per gallon; all other alizarin assistant, not specially provided for in this act, thirty per centum ad valorem.

33. Castor oil, thirty-five cents per gallon.

34. Cod-liver oil, fifteen cents per gallon.

35. Cotton-seed oil, four cents per gallon of seven and one half pounds weight.

36. Croton oil, twenty cents per pound.

37. Flaxseed, linseed, and poppy-seed oil, raw, boiled, or oxidized, twenty cents per gallon of seven and one half pounds weight.

38. Fusel oil, or amylic alcohol, one fourth of one cent per pound.

39. Hemp-seed oil and rape-seed oil, ten cents per gallon.

40. Olive oil, not specially provided for in this act,

forty cents per gallon; in bottles, jars, tins, or similar packages, fifty cents per gallon.

41. Peppermint oil, fifty cents per pound.

42. Seal, herring, whale, and other fish oil, not specially provided for in this act, eight cents per gallon.

43. Opium, crude or unmanufactured, and not adulterated, containing nine per centum and over of morphia, one dollar per pound; morphia or morphine, sulphate of, and all alkaloïds or salts of opium, one dollar per ounce; aqueous extract of opium, for medicinal uses, and tincture of, as laudanum, and other liquid preparations of opium, not specially provided for in this act, forty per centum ad valorem; opium containing less than nine per centum of morphia and opium prepared for smoking, six dollars per pound; but opium prepared for smoking and other preparations of opium deposited in bonded warehouses shall not be removed therefrom without payment of duties, and such duties shall not be refunded.

Paints, Colors, and Varnishes.—44. Baryta, sulphate of, or barytes, including barytes earth, unmanufactured, seventy-five cents per ton; manufactured, five dollars and twenty-five cents per ton.

45. Blues, such as Berlin, Prussian, Chinese, and all others, containing ferrocyanide of iron, in pulp, dry or ground in or mixed with oil or water, eight cents per pound.

46. Blanc-fixe, or artificial sulphate of barytes, and main white, or artificial sulphate of lime, one half of one cent per pound.

47. Black, made from bone, ivory, or vegetable substance, by whatever name known, including bone black and lampblack, dry or ground in oil or water, twenty-five per centum ad valorem.

48. Chrome yellow, chrome green, and all other chromium colors in the manufacture of which lead and bichromate of potash or soda are used, in pulp, dry, or ground in or mixed with oil or water, four and one half cents per pound.

49. Ocher and ochery earths, sienna and sienna earths, and umber and umber earths, not specially provided for, when crude or not powdered, washed or pulverized, one eighth of one cent per pound; if powdered, washed, or pulverized, three eighths of one cent per pound; if ground in oil or water, one and one half cent per pound.

50. Orange mineral, three and three eighths cents per pound.

51. Red lead, two and seven-eighths cents per pound.

52. Ultramarine blue, whether dry, in pulp, or mixed with water, and wash blue containing ultramarine, three and three fourths cents per pound.

53. Varnishes, including so-called gold size or japan, thirty-five per centum ad valorem; spirit varnishes, one dollar and thirty-two cents per gallon and thirty-five per centum ad valorem.

54. Vermillion red, and other colors containing quicksilver, dry or ground in oil or water, ten cents per pound; when not containing quicksilver but made of lead or containing lead, five cents per pound.

55. White lead, white paint and pigment containing lead, dry or in pulp, or ground or mixed with oil, two and seven eighths cents per pound.

56. Whiting and Paris white, dry, one fourth of one cent per pound; ground in oil, or putty, one cent per pound.

57. Zinc, oxide of, and white paint or pigment containing zinc, but not containing lead, dry, one cent per pound; ground in oil, one and three fourths cent per pound; sulphid of zinc white, or white sulphide of zinc, one and one fourth cent per pound; chloride of zinc and sulphate of zinc, one cent per pound.

58. All paints, colors, pigments, lakes, crayons, smalts, and frostings, whether crude or dry or mixed, or ground with water or oil or with solutions other than oil, not otherwise specially provided for in this act, thirty per centum ad valorem; all paints, colors, and pigments, commonly known as artists' paints or colors, whether in tubes, pans, cakes, or other forms, thirty per centum ad valorem.

59. Paris green and London purple, fifteen per centum ad valorem.

60. Lead: Acetate of, white, three and one fourth cents per pound; brown, gray, or yellow, two and one fourth cents per pound; nitrate of, two and one half cents per pound; litharge, two and three fourth cents per pound.

61. Phosphorus, eighteen cents per pound.

Potash.—62. Bichromate and chromate of, three cents per pound.

63. Caustic or hydrate of, refined, in sticks or rolls, one cent per pound; chloride of, two and one half cents per pound.

64. Hydriodate, iodide, and iodate of, twenty-five cents per pound.

65. Nitrate of, or saltpeter, refined, one half cent per pound.

66. Prussiate of, red, eight cents per pound; yellow, four cents per pound; cyanide of potassium, twelve and one half per centum ad valorem.

Preparations.—67. Medicinal preparations containing alcohol, or in the preparation of which alcohol is used, not specially provided for in this act, fifty-five cents per pound, but in no case shall the same pay less than twenty-five per centum ad valorem.

68. Medicinal preparations not containing alcohol or in the preparation of which alcohol is not used, not specially provided for in this act, twenty-five per centum ad valorem; calomel and other mercurial medicinal preparations, thirty-five per centum ad valorem.

69. Plasters, healing or curative, of all kinds, and court-plaster, thirty-five per centum ad valorem.

70. Preparations used as applications to the hair, mouth, teeth, or skin, such as cosmetics, dentifrices, pastes, pomades, powders, and other toilet articles, and articles of perfumery, whether in sachets or otherwise, not containing alcohol or in the manufacture of which alcohol is not used, and not specially provided for in this act, fifty per centum ad valorem.

71. Nantonin, and all salts thereof containing eighty per centum or over of nantonin, one dollar per pound.

Soap.—72. Castile soap, one and one fourth cent per pound; fancy, perfumed, and all descriptions of toilet soap, including so-called medicinal or medicated soaps, fifteen cents per pound; all other soaps not specially provided for in this act, twenty per centum ad valorem.

Soda.—73. Bicarbonate of soda, or supercarbonate of soda, or saleratus, and other alkalies containing fifty per centum or more of bicarbonate of soda, three fourths of one cent per pound.

74. Bichromate and chromate of soda, two cents per pound.

75. Crystal carbonate of soda, or concentrated soda crystals, or monohydrate, or sesquicarbonate of soda, three tenths of one cent per pound; chloride of soda, two cents per pound.

76. Hydrate of, or caustic soda, three fourths of one cent per pound; nitrite of soda, two and one half cents per pound; hyposulphite and sulphide of soda, one half of one cent per pound.

77. Sal soda, or soda crystals, not concentrated, two tenths of one cent per pound.

78. Soda ash, three eighths of one cent per pound; arseniate of soda, one and one fourth cent per pound.

79. Silicate of soda, or other alkaline silicate, one half of one cent per pound.

80. Sulphate of soda, or salt cake, or niter cake, one dollar and twenty-five cents per ton.

81. Sea moss, ten per centum ad valorem.

82. Sponges, twenty per centum ad valorem; manufactures of sponges, or of which sponge is the component material of chief value, not specially provided for in this act, forty per centum ad valorem.

83. Strychnia, or strychnine, and all salts thereof, thirty cents per ounce.

84. Sulphur, refined or sublimed, or flowers of, eight dollars per ton.

85. Sumac, ground, three tenths of one cent per pound.

86. Vanillin, eighty cents per ounce.

SCHEDULE B.—EARTH, EARTHENWARE, AND GLASSWARE.

Brick and Tile.—87. Fire brick, weighing not more than ten pounds each, not glazed, enameled, ornamented, or decorated in any manner, one dollar and twenty-five cents per ton; glazed, enameled, ornamented, or decorated, forty-five per centum ad valorem; brick, other than fire brick, not glazed, enameled, painted, vitrified, ornamented, or decorated in any manner, twenty-five per centum ad valorem; if glazed, enameled, painted, vitrified, ornamented, or decorated in any manner, forty-five per centum ad valorem.

88. Tiles, plain unglazed, one color, exceeding two square inches in size, four cents per square foot; glazed, encaustic, ceramic, mosaic, vitrified, semi-vitrified, tint, spar, embossed, enameled, ornamental, hand-painted, gold decorated, and all other earthenware tiles, except at not exceeding forty cents per square foot, eight cents per

square foot; exceeding forty cents per square foot, ten cents per square foot and twenty-five per centum ad valorem.

Cement, Lime, and Plaster.—89. Roman, Portland, and other hydraulic cement, in barrels, sacks, or other packages, eight cents per one hundred pounds, including weight of barrel or package; in bulk, seven cents per one hundred pounds; other cement, twenty per centum ad valorem.

90. Lime, five cents per one hundred pounds, including weight of barrel or package.

91. Plaster rock or gypsum, crude, fifty cents per ton; if ground or calcined, two dollars and twenty-five cents per ton; pearl hardening for papermakers' use, twenty per centum ad valorem.

92. Pumice stone, wholly or partially manufactured, six dollars per ton; unmanufactured, fifteen per centum ad valorem.

Clays or Earths.—93. Clays or earths, unwrought or unmanufactured, not specially provided for in this act, one dollar per ton; wrought or manufactured, not specially provided for in this act, two dollars per ton; china clay or kaolin, two dollars and fifty cents per ton; limestone rock asphalt containing not more than fifteen per centum of bitumen, fifty cents per ton; asphaltum and bitumen, not specially provided for in this act, crude, if not dried, or otherwise advanced in any manner, one dollar and fifty cents per ton; if dried or otherwise advanced in any manner, three dollars per ton; bauxite, or beauxite, crude, not refined or otherwise advanced in condition from its natural state, one dollar per ton; fullers' earth, unwrought and unmanufactured, one dollar and fifty cents per ton; wrought or manufactured, three dollars per ton.

Earthenware and China.—94. Common yellow-brown, or gray earthenware, plain, embossed, or salt-glazed common stoneware, and crucibles, all the foregoing not decorated in any manner, twenty-five per centum ad valorem; Rockingham earthenware not decorated, forty per centum ad valorem.

95. China, porcelain, parian, bisque, earthen, stone, and crockery ware, including clock cases with or without movements, plaques, ornaments, toys, toy tea sets, charms, vases and statuettes, painted, tinted, stained, enameled, printed, gilded, or otherwise decorated or ornamented in any manner, sixty per centum ad valorem; if plain white and without superadded ornamentation of any kind, fifty-five per centum ad valorem.

96. All other china, porcelain, parian, bisque, earthen, stone, and crockery ware, and manufactures thereof, or of which the same is the component material of chief value, by whatever name known, not specially provided for in this act, if painted, tinted, stained, enameled, printed, gilded, or otherwise decorated or ornamented in any manner, sixty per centum ad valorem; if not ornamented or decorated, fifty-five per centum ad valorem.

97. Articles and wares composed wholly or in chief value of earthy or mineral substances, or carbon, not specially provided for in this act, if not decorated in any manner, thirty-five per centum ad valorem; if decorated, forty-five per centum ad valorem.

98. Gas retorts, three dollars each; lava tips for burners, ten cents per gross and fifteen per centum ad valorem; carbons for electric lighting, ninety cents per hundred; filter tubes, forty-five per centum ad valorem; porous carbon pots for electric batteries, without metallic connections, twenty per centum ad valorem.

Glass and Glassware.—99. Plain green or colored, molded or pressed, and flint, lime, or lead glass bottles, vials, jars, and covered or uncovered demijohns and carboys, any of the foregoing, filled or unfilled, not otherwise specially provided for, and whether their contents be dutiable or free (except such as contain merchandise subject to an ad valorem rate of duty, or to a rate of duty based in whole or in part upon the value thereof, which shall be dutiable at the rate applicable to their contents) shall pay duty as follows: If holding more than one pint, one cent per pound; if holding not more than one pint and not less than one fourth of a pint, one and one half cent per pound; if holding less than one fourth of a pint, fifty cents per gross: *Provided*, That none of the above articles shall pay a less rate of duty than forty per centum ad valorem.

100. Glass bottles, decanters, or other vessels or articles of glass, cut, engraved, painted, colored, stained, silvered, gilded, etched, frosted, printed in any manner or otherwise ornamented, decorated, or ground (except such

grinding as is necessary for fitting stoppers), and any articles of which such glass is the component material of chief value, and porcelain, opal and other blown glassware; all the foregoing, filled or unfilled, and whether their contents be dutiable or free, sixty per centum ad valorem.

101. Unpolished, cylinder, crown, and common window glass, not exceeding ten by fifteen inches square, one and three eighths cent per pound; above that, and not exceeding sixteen by twenty-four inches square, one and seven eighths cents per pound; above that, and not exceeding twenty-four by thirty inches square, two and three eighths cent per pound; above that, and not exceeding twenty-four by thirty-six inches square, two and seven eighths cents per pound; above that, and not exceeding thirty by forty inches square, three and three eighths cents per pound; above that, and not exceeding forty by sixty inches square, three and seven eighths cents per pound; above that, four and three eighths cents per pound: *Provided*, That unpolished cylinder, crown, and common window glass, imported in boxes, shall contain fifty square feet, as nearly as sizes will permit, and the duty shall be computed thereon according to the actual weight of glass.

102. Cylinder and crown glass, polished, not exceeding sixteen by twenty-four inches square, four cents per square foot; above that, and not exceeding twenty-four by thirty inches square, six cents per square foot; above that, and not exceeding twenty-four by sixty inches square, fifteen cents per square foot; above that, twenty cents per square foot.

103. Fluted, rolled, ribbed, or rough plate glass, or the same containing a wire netting within itself, not including crown, cylinder, or common window glass, not exceeding sixteen by twenty-four inches square, three-fourths of one cent per square foot; above that, and not exceeding twenty-four by thirty inches square, one and one fourth cent per square foot; all above that, one and three fourths cent per square foot; and all fluted, rolled, ribbed, or rough plate glass, weighing over one hundred pounds per one hundred square feet, shall pay an additional duty on the excess at the same rates herein imposed: *Provided*, That all of the above plate glass, when ground, smoothed, or otherwise obscured, shall be subject to the same rate of duty as cast polished plate glass unsilvered.

104. Cast polished plate glass, finished or unfinished and unsilvered, not exceeding sixteen by twenty-four inches square, eight cents per square foot; above that, and not exceeding twenty-four by thirty inches square, ten cents per square foot; above that, and not exceeding twenty-four by sixty inches square, twenty-two and one half cents per square foot; all above that, thirty-five cents per square foot.

105. Cast polished plate glass, silvered, cylindered and crown glass, silvered, and looking-glass plates, exceeding in size one hundred and forty-four square inches and not exceeding sixteen by twenty-four inches square, eleven cents per square foot; above that, and not exceeding twenty-four by thirty inches square, thirteen cents per square foot; above that, and not exceeding twenty-four by sixty inches square, twenty-five cents per square foot; all above that, thirty-eight cents per square foot.

106. But no looking-glass plates or plate glass, silvered, when framed, shall pay a less rate of duty than that imposed upon similar glass of like description not framed, but shall pay in addition thereto upon such frames the rate of duty applicable thereto when imported separate.

107. Cast polished plate glass, silvered or unsilvered, and cylinder, crown, or common window glass, silvered or unsilvered, when bent, ground, obscured, frosted, sanded, enameled, beveled, etched, embossed, engraved, flashed, stained, colored, painted, or otherwise ornamented or decorated, shall be subject to a duty of five per centum ad valorem in addition to the rates otherwise chargeable thereon.

108. Spectacles, eyeglasses, and goggles, and frames for the same, or parts thereof, finished or unfinished, valued at not over forty cents per dozen, twenty cents per dozen and fifteen per centum ad valorem; valued at over forty cents per dozen and not over one dollar and fifty cents per dozen, forty-five cents per dozen and twenty per centum ad valorem; valued at over one dollar and fifty cents per dozen, fifty per centum ad valorem.

109. Lenses of glass or pebble, ground and polished to a spherical, cylindrical, or prismatic form, and ground and polished plano or coquill glasses, wholly or partly

manufactured, with the edges unground, forty-five per centum ad valorem; if with their edges ground or beveled, ten cents per dozen pairs and forty-five per centum ad valorem.

110. Strips of glass, not more than three inches wide, ground or polished on one or both sides to a cylindrical or prismatic form, and glass slides for magic lanterns, forty-five per centum ad valorem.

111. Opera and field glasses, telescopes, microscopes, photographic and projecting lenses and optical instruments, and frames or mountings for the same; all the foregoing not specially provided for in this act, forty-five per centum ad valorem.

112. Stained or painted glass windows, or parts thereof, and all mirrors, not exceeding in size one hundred and forty-four square inches, with or without frames or cases, and all glass or manufactures of glass or paste, or of which glass or paste is the component material of chief value, not specially provided for in this act, forty-five per centum ad valorem.

113. Fusible enamel, twenty-five per centum ad valorem.

Marble and Stone, and Manufactures of.—114. Marble in block, rough or squared only, sixty-five cents per cubic foot; onyx in block, rough or squared, one dollar and fifty cents per cubic foot; marble or onyx, sawed or dressed, over two inches in thickness, one dollar and ten cents per cubic foot; slabs or paving tiles of marble or onyx, containing not less than four superficial inches, if not more than one inch in thickness, twelve cents per superficial foot; if more than one inch and not more than one and one half inch in thickness, fifteen cents per superficial foot; if more than one and one half inch and not more than two inches in thickness, eighteen cents per superficial foot; if rubbed in whole or in part, three cents per superficial foot in addition; mosaic cubes of marble, onyx, or stone, not exceeding two cubic inches in size, if loose, one cent per pound and twenty per centum ad valorem; if attached to paper or other material, twenty cents per superficial foot and thirty-five per centum ad valorem.

115. Manufactures of agate, alabaster, chalcedony, chrysolite, coral, cornelian, garnet, jasper, jet, malachite, marble, onyx, rock crystal, or spar, including clock cases with or without movements, not specially provided for in this act, fifty per centum ad valorem.

Stone.—116. Burr stones, manufactured or bound up into millstones, fifteen per centum ad valorem.

117. Freestone, granite, sandstone, limestone, and other building or monumental stone, except marble and onyx, unmanufactured or undressed, not specially provided for in this act, twelve cents per cubic foot.

118. Freestone, granite, sandstone, limestone, and other building or monumental stone, except marble and onyx, not specially provided for in this act, hewn, dressed, or polished, fifty per centum ad valorem.

119. Grindstones, finished or unfinished, one dollar and seventy-five cents per ton.

Slate.—120. Slates, slate chimney-pieces, mantels, slabs for tables, roofing slates, and all other manufactures of slate, not specially provided for in this act, twenty per centum ad valorem.

SCHEDULE C.—METALS AND MANUFACTURES OF.

121. Iron ore, including manganiferous iron ore, and the dross or residuum from burnt pyrites, forty cents per ton: *Provided*, That in levying and collecting the duty on iron ore no deduction shall be made from the weight of the ore on account of moisture which may be chemically or physically combined therewith; basic slag, ground or unground, one dollar per ton.

122. Iron in pigs, iron kientledge, spiegeleisen, ferro-manganese, ferro-allicon, wrought and cast scrap iron, and scrap steel, four dollars per ton; but nothing shall be deemed scrap iron or scrap steel except waste or refuse iron or steel fit only to be remanufactured.

123. Bar iron, square iron, rolled or hammered, comprising flats not less than one inch wide nor less than three eighths of one inch thick, round iron not less than seven sixteenths of one inch in diameter, six tenths of one cent per pound.

124. Round iron, in coils or rods, less than seven sixteenths of one inch in diameter, and bars or shapes of rolled or hammered iron, not specially provided for in this act, eight tenths of one cent per pound: *Provided*, That all iron in slabs, blooms, loops, or other forms less finished than iron in bars, and more advanced than pig

iron, except castings, shall be subject to a duty of five tenths of one cent per pound. *Provided further*, That all iron bars, blooms, billets, or rods or shapes of any kind, in the manufacture of which charcoal is used as fuel, shall be subject to a duty of twelve dollars per ton.

125. Beams, girders, joists, angles, channels, car-truck channels, T T, columns and posts or parts or sections of columns and posts, deck and bulb beams, and building forms, together with all other structural shapes of iron or steel, whether plain or punched, or fitted for use, five tenths of one cent per pound.

126. Boiler or other plate iron or steel, except crucible plate steel and saw plates hereinafter provided for, not thinner than number ten wire gauge, sheared or un-sheared, and skelp iron or steel sheared or rolled in grooves, valued at one cent per pound or less, five tenths of one cent per pound; valued above one cent and not above two cents per pound, six tenths of one cent per pound; valued above two cents and not above four cents per pound, one cent per pound; valued at over four cents per pound, twenty-five per centum ad valorem: *Provided*, That all sheets or plates of iron or steel thinner than number ten wire gauge shall pay duty as iron or steel sheets.

127. Iron or steel anchors or parts thereof, one and one half cent per pound; forgings of iron or steel or of combined iron and steel, of whatever shape or whatever degree or stage of manufacture, not specially provided for in this act, thirty-five per centum ad valorem; antifriction ball forgings of iron or steel, or of combined iron and steel, forty-five per centum ad valorem.

128. Hoop, band, or scroll iron or steel, not otherwise provided for in this act, valued at three cents per pound or less, eight inches or less in width, and less than three eighths of one inch thick and not thinner than number ten wire gauge, five tenths of one cent per pound; thinner than number ten wire gauge and not thinner than number twenty wire gauge, six tenths of one cent per pound; thinner than number twenty wire gauge, eight tenths of one cent per pound: *Provided*, That barrel hoops of iron or steel, and hoop or band iron or hoop or band steel flared, splayed, or punched, with or without buckles or fastenings, shall pay one tenth of one cent per pound more duty than that imposed on the hoop or band iron or steel from which they are made; steel bands or strips, untempered, suitable for making band saws, three cents per pound and twenty per centum ad valorem; if tempered, or tempered and polished, six cents per pound and twenty per centum ad valorem.

129. Hoop or band iron, or hoop or band steel, cut to lengths, or wholly or partly manufactured into hoops or ties, coated or not coated with paint or any other preparation, with or without buckles or fastenings, for baling cotton or any other commodity, five tenths of one cent per pound.

130. Railway bars, made of iron or steel, and railway bars made in part of steel, T rails, and punched iron or steel flat rails, seven twentieths of one cent per pound; railway fish-plates or splice-bars, made of iron or steel, four tenths of one cent per pound.

131. Sheets of iron or steel, common or black, of whatever dimensions, and skelp iron or steel, valued at three cents per pound or less, thinner than number ten and not thinner than number twenty wire gauge, seven tenths of one cent per pound; thinner than number twenty wire gauge and not thinner than number twenty-five wire gauge, eight tenths of one cent per pound; thinner than number twenty-five wire gauge and not thinner than number thirty-two wire gauge, one and one tenth cent per pound; thinner than number thirty-two wire gauge, one and two tenths cent per pound; corrugated or crimped, one and one tenth cent per pound: *Provided*, That all sheets of common or black iron or steel not thinner than number ten wire gauge shall pay duty as plate iron or plate steel.

132. All iron or steel sheets or plates, and all hoop, band, or scroll iron or steel, excepting what are known commercially as tin plates,terne plates, and tangle-iron, and hereinafter provided for, when galvanized or coated with zinc, spelter, or other metals, or any alloy of those metals, shall pay two tenths of one cent per pound more duty than if the same was not so galvanized or coated.

133. Sheets of iron or steel, polished, planished, or glanced, by whatever name designated, two cents per pound: *Provided*, That plates or sheets of iron or steel, by whatever name designated, other than the polished,

planished, or glanced herein provided for, which have been pickled or cleaned by acid, or by any other material or process, or which are cold rolled, smoothed only, not polished, shall pay two tenths of one cent per pound more duty than the corresponding gauges of common or black sheet iron or steel.

134. Sheets or plates of iron or steel, or taggers iron or steel, coated with tin or lead, or with a mixture of which these metals, or either of them, is a component part, by the dipping or any other process, and commercially known as tin plates,terne plates, and taggers tin, one and one half cent per pound.

135. Steel ingots, cogged ingots, blooms, and slabs, by whatever process made; die blocks or blanks; billets and bars and tapered or beveled bars; mill shafting; pressed, sheared, or stamped shapes; saw plates, wholly or partially manufactured; hammer molds or swayed steel; gun-barrel molds not in bars; alloys used as substitutes for steel in the manufacture of tools; all descriptions and shapes of dry sand, loam, or iron-molded steel castings; sheets and plates and steel in all forms and shapes not specially provided for in this act, all of the above valued at one cent per pound or less, three tenths of one cent per pound; valued above one cent and not above one and four tenths cent per pound, four tenths of one cent per pound; valued above one and four tenths cent and not above one and eight tenths cent per pound, six tenths of one cent per pound; valued above one and eight tenths cent and not above two and two tenths cents per pound, seven tenths of one cent per pound; valued above two and two tenths cents and not above three cents per pound, nine tenths of one cent per pound; valued above three cents per pound and not above four cents per pound, one and two tenths cent per pound; valued above four cents and not above seven cents per pound, one and three tenths cent per pound; valued above seven cents and not above ten cents per pound, two cents per pound; valued above ten cents and not above thirteen cents per pound, two and four tenths cents per pound; valued above thirteen cents and not above sixteen cents per pound, two and eight tenths cents per pound; valued above sixteen cents per pound, four and seven tenths cents per pound.

Wire.—136. Wire rods: Rivet, screw, fence, and other iron or steel wire rods, whether round, oval, flat, or square, or in any other shape, and nail rods, in coils or otherwise, valued at four cents or less per pound, four tenths of one cent per pound; valued over four cents per pound, three fourths of one cent per pound: *Provided*, That all round iron or steel rods smaller than number six wire gauge shall be classed and dutiable as wire: *Provided further*, That all iron or steel wire rods which have been tempered or treated in any manner or partly manufactured shall pay an additional duty of one half of one cent per pound.

137. Round iron or steel wire, not smaller than number thirteen wire gauge, one and one fourth cent per pound; smaller than number thirteen and not smaller than number sixteen wire gauge, one and one half cent per pound; smaller than number sixteen wire gauge, two cents per pound: *Provided*, That all the foregoing valued at more than four cents per pound shall pay forty per centum ad valorem. Iron or steel or other wire not specially provided for in this act, including such as is commonly known as hat wire, or bonnet wire, erinoline wire, corset wire, needle wire, piano wire, clock wire, and watch wire, whether flat or otherwise, and corset clasps, corset steels and dress steels, and sheet steel in strips, twenty-five one thousandths of an inch thick or thinner, any of the foregoing, whether uncovered or covered with cotton, silk, metal, or other material, valued at more than four cents per pound, forty-five per centum ad valorem: *Provided*, That articles manufactured from iron, steel, brass, or copper wire, shall pay the rate of duty imposed upon the wire used in the manufacture of such articles, and in addition thereto one and one fourth cent per pound, except that wire rope and wire strand shall pay the maximum rate of duty which would be imposed upon any wire used in the manufacture thereof, and in addition thereto one cent per pound; and on iron or steel wire coated with zinc, tin, or any other metal, two tenths of one cent per pound in addition to the rate imposed on the wire from which it is made.

General Provisions.—138. No allowance or reduction of duties for partial loss or damage in consequence of rust or of discoloration shall be made upon any description of iron or steel, or upon any article wholly or partly

manufactured of iron or steel, or upon any manufacture of iron or steel.

139. All metal produced from iron or its ores, which is cast and malleable, of whatever description or form, without regard to the percentage of carbon contained therein, whether produced by cementation, or converted, cast, or made from iron or its ores, by the crucible, Bessemer, Clapp-Griffith, pneumatic, Thomas-Gilchrist, basic, Siemens-Martin, or open-hearth process, or by the equivalent of either, or by a combination of two or more of the processes, or their equivalents, or by any fusion or other process which produces from iron or its ores a metal either granular or fibrous in structure, which is cast and malleable, excepting what is known as malleable-iron castings, shall be classed and denominated as steel.

140. No article not specially provided for in this act, which is wholly or partly manufactured from tin plate,terne plate, or the sheet, plate, hoop, band, or scroll iron or steel herein provided for, or of which such tin plate,terne plate, sheet, plate, hoop, band, or scroll iron or steel shall be the material of chief value, shall pay a lower rate of duty than that imposed on the tin plate,terne plate, or sheet, plate, hoop, band, or scroll iron or steel from which it is made, or of which it shall be the component thereof of chief value.

141. On all iron or steel bars or rods of whatever shape or section which are cold rolled, cold drawn, cold hammered, or polished in any way in addition to the ordinary process of hot rolling or hammering, there shall be paid one fourth of one cent per pound in addition to the rates provided in this act on bars or rods of whatever section or shape which are hot rolled; and on all strips, plates, or sheets of iron or steel of whatever shape, other than the polished, planished, or glanced sheet iron or sheet steel hereinbefore provided for, which are cold rolled, cold hammered, blued, brightened, tempered, or polished by any process to such perfected surface finish or polish better than the grade of cold rolled, smoothed only, hereinbefore provided for, there shall be paid one cent per pound in addition to the rates provided in this act upon plates, strips, or sheets of iron or steel of common or black finish; and on steel circular saw plates there shall be paid one half of one cent per pound in addition to the rate provided in this act for steel saw plates.

Manufactures of Iron and Steel.—142. Anvils of iron or steel, or of iron and steel combined, by whatever process made, or in whatever stage of manufacture, one and seven eighths cent per pound.

143. Axles or parts thereof, axle bars, axle blanks, or forgings for axles, whether of iron or steel, without reference to the stage or state of manufacture, valued at not more than six cents per pound, one cent per pound: *Provided*, That when iron or steel axles are imported fitted in wheels, or parts of wheels, of iron or steel, they shall be dutiable at the same rate as the wheels in which they are fitted.

144. Blacksmiths' hammers and sledges, track tools, wedges, and crowbars, whether of iron or steel, one and one half cent per pound.

145. Bolts, with or without threads or nuts, or bolt-blanks, and finished hinges or hinge-blanks, whether of iron or steel, one and one half cent per pound.

146. Card-clothing manufactured from tempered steel wire, forty-five cents per square foot; all other, twenty cents per square foot.

147. Cast-iron pipe of every description, four tenths of one cent per pound.

148. Cast-iron vessels, plates, stove plates and irons, sad-irons, tailors' irons, hatters' irons, and castings of iron, not specially provided for in this act, eight tenths of one cent per pound.

149. Castings of malleable iron not specially provided for in this act, nine tenths of one cent per pound.

150. Cast hollow-ware, coated, glazed, or tinned, two cents per pound.

151. Chain or chains of all kinds, made of iron or steel, not less than three fourths of one inch in diameter, one and one eighth cent per pound; less than three fourths of one inch and not less than three eighths of one inch in diameter, one and three eighths cent per pound; less than three eighths of one inch in diameter and not less than five sixteenths of one inch in diameter, one and seven eighths cent per pound; less than five sixteenths of one inch in diameter, three cents per pound; but no chain or chains of any description shall

pay a lower rate of duty than forty-five per centum ad valorem.

152. Lap welded, butt welded, seamed, or jointed iron or steel boiler tubes, pipes, flues, or stays, not thinner than number sixteen wire gauge, two cents per pound; welded cylindrical furnaces, made from plate metal, two and one half cents per pound; all other iron or steel tubes, finished, not specially provided for in this act, thirty-five per centum ad valorem.

Cutlery.—153. Penknives or pocketknives, clasp knives, pruning knives, and budding knives of all kinds, or parts thereof, and erasers or manicure knives, or parts thereof, wholly or partly manufactured, valued at not more than forty cents per dozen, forty per centum ad valorem; valued at more than forty cents per dozen and not exceeding fifty cents per dozen, one cent per piece and forty per centum ad valorem; valued at more than fifty cents per dozen and not exceeding one dollar and twenty-five cents per dozen, five cents per piece and forty per centum ad valorem; valued at more than one dollar and twenty-five cents per dozen and not exceeding three dollars per dozen, ten cents per piece and forty per centum ad valorem; valued at more than three dollars per dozen, twenty cents per piece and forty per centum ad valorem: *Provided*, That blades, handles, or other parts of either or any of the foregoing articles, imported in any other manner than assembled in finished knives or erasers, shall be subject to no less rate of duty than herein provided for penknives, pocketknives, clasp knives, pruning knives, manicure knives, and erasers valued at more than fifty and not more than one dollar and fifty cents per dozen. Razors and razor blades, finished or unfinished, valued at less than one dollar and fifty cents per dozen, fifty cents per dozen and fifteen per centum ad valorem; valued at one dollar and fifty cents per dozen and less than three dollars per dozen, one dollar per dozen and fifteen per centum ad valorem; valued at three dollars per dozen or more, one dollar and seventy-five cents per dozen and twenty per centum ad valorem. Scissors and shears, and blades for the same, finished or unfinished, valued at not more than fifty cents per dozen, fifteen cents per dozen and fifteen per centum ad valorem; valued at more than fifty cents and not more than one dollar and seventy-five cents per dozen, fifty cents per dozen and fifteen per centum ad valorem; valued at more than one dollar and seventy-five cents per dozen, seventy-five cents per dozen and twenty-five per centum ad valorem.

154. Swords, sword blades, and side arms, thirty-five per centum ad valorem.

155. Table, butchere', carving, cooks', hunting, kitchen, bread, butter, vegetable, fruit, cheese, plumbers', painters', palette, artists', and shoe knives, forks and steels, finished or unfinished, with handles of mother-of-pearl, shell, or ivory, sixteen cents each; with handles of deer horn, twelve cents each; with handles of hard rubber, solid bone, celluloid, or any pyroxyline material, five cents each; with handles of any other material than those above mentioned, one and one half cent each, and in addition, on all the above articles, fifteen per centum ad valorem: *Provided*, That none of the above-named articles shall pay a less rate of duty than forty-five per centum ad valorem.

156. Files, file blanks, rasps, and floats, of all cuts and kinds, two and one half inches in length and under, thirty cents per dozen; over two and one half inches in length and not over four and one half inches, fifty cents per dozen; over four and one half inches in length and under seven inches, seventy-five cents per dozen; seven inches in length and over, one dollar per dozen.

Firearms.—157. Muskets, muzzle-loading shotguns, rifles, and parts thereof, twenty-five per centum ad valorem.

158. Double-barreled, sporting, breech-loading, shotguns, combination shotguns and rifles, valued at not more than five dollars, one dollar and fifty cents each and in addition thereto fifteen per centum ad valorem; valued at more than five dollars and not more than ten dollars, four dollars each and in addition thereto fifteen per centum ad valorem each; valued at more than ten dollars, six dollars each; double barrels for sporting breech-loading shotguns and rifles further advanced in manufacture than rough bored only, three dollars each; stocks for double-barreled sporting breech-loading shotguns and rifles wholly or partially manufactured, three dollars each; and in addition thereto on all such guns and rifles, valued at more than ten dollars each, and on

such stocks and barrels, thirty-five per centum ad valorem; on all other parts of such guns or rifles, and fittings for such stocks or barrels, finished or unfinished, fifty per centum ad valorem: *Provided*, That all double-barreled sporting breech-loading shotguns and rifles imported without a lock or locks or other fittings shall be subject to a duty of six dollars each and thirty-five per centum ad valorem; single-barreled breech-loading shotguns, or parts thereof, except as otherwise specially provided for in this act, one dollar each and thirty-five per centum ad valorem. Revolving pistols or parts thereof, seventy-five cents each and twenty-five per centum ad valorem.

159. Sheets, plates, wares, or articles of iron, steel, or other metal, enameled or glazed with vitreous glasses, forty per centum ad valorem.

Nails, Spikes, Tacks, and Needles.—160. Cut nails and cut spikes of iron or steel, six tenths of one cent per pound.

161. Horseshoe nails, hob nails, and all other wrought-iron or steel nails not specially provided for in this act, two and one fourth cents per pound.

162. Wire nails made of wrought iron or steel, not less than one inch in length and not lighter than number sixteen wire gauge, one half of one cent per pound; less than one inch in length and lighter than number sixteen wire gauge, one cent per pound.

163. Spikes, nuts, and washers, and horse, mule, or ox shoes, of wrought iron or steel, one cent per pound.

164. Cut tacks, brads, or sprigs, not exceeding sixteen ounces to the thousand, one and one fourth cent per thousand; exceeding sixteen ounces to the thousand, one and one half cent per pound.

165. Needles for knitting or sewing machines, including latch needles, one dollar per thousand and twenty-five per centum ad valorem; crochet needles and tape needles, knitting and all other needles, not specially provided for in this act, and bodkins of metal, twenty-five per centum ad valorem.

Plates.—166. Steel plates engraved, stereotype plates, electrotype plates, and plates of other materials, engraved or lithographed, for printing, twenty-five per centum ad valorem.

167. Rivets of iron or steel, two cents per pound.

Saws.—168. Crosscut saws, six cents per linear foot; mill saws, ten cents per linear foot; pit and drag saws, eight cents per linear foot; circular saws, twenty-five per centum ad valorem; steel band saws, finished or further advanced than tempered and polished, ten cents per pound and twenty per centum ad valorem; hand, back, and all other saws, not specially provided for in this act, thirty per centum ad valorem.

169. Screws, commonly called wood screws, made of iron or steel, more than two inches in length, four cents per pound; over one inch and not more than two inches in length, six cents per pound; over one half inch and not more than one inch in length, eight and one half cents per pound; one half inch and less in length, twelve cents per pound.

170. Umbrella and parasol ribs and stretchers, composed in chief value of iron, steel, or other metal, in frames or otherwise, fifty per centum ad valorem.

171. Wheels for railway purposes, or parts thereof, made of iron or steel, and steel-tired wheels for railway purposes, whether wholly or partly finished, and iron or steel locomotive, car, or other railway tires or parts thereof, wholly or partly manufactured, one and one half cent per pound; and ingots, clogged ingots, blooms, or blanks for the same, without regard to the degree of manufacture, one and one fourth cent per pound: *Provided*, That when wheels for railway purposes, or parts thereof, of iron or steel, are imported with iron or steel axles fitted in them, the wheels and axles together shall be dutiable at the same rate as is provided for the wheels when imported separately.

Miscellaneous Metals and Manufactures of.—172. Aluminium, and alloys of any kind in which aluminium is the component material of chief value, in any form, eight cents per pound; in plates, sheets, bars, and rods, thirteen cents per pound.

173. Antimony, as regulus or metal, three fourths of one cent per pound.

174. Argentine, albata, or German silver, manufactured, twenty-five per centum ad valorem.

175. Bronze powder, twelve cents per pound; bronze or Dutch-metal or aluminium, in any form, one cent per package of one hundred leaves.

176. Copper in rolled plates, called braziers' copper, sheets, coils, pipes, and copper bottoms, two and one half cents per pound; sheathing or yellow metal of which copper is the component material of chief value, and not composed wholly or in part of iron ungalvanized, two cents per pound.

Gold and Silver.—177. Gold leaf, one dollar and seventy-five cents per package of five hundred leaves.

178. Silver leaf, seventy-five cents per package of five hundred leaves.

179. Tinsel wire, lame or lahn, made wholly or in chief value of gold, silver, or other metal, five cents per pound; bullions and metal threads, made wholly or in chief value of tinsel wire, lame or lahn, five cents per pound and thirty-five per centum ad valorem; laces, embroideries, braids, galloons, trimmings, or other articles, made wholly or in chief value of tinsel wire, lame or lahn, bullions, or metal threads, sixty per centum ad valorem.

180. Hooks and eyes, metallic, whether loose, carded, or otherwise, including weight of carls, cartons, and immediate wrappings and labels, five and one half cents per pound and fifteen per centum ad valorem.

Lead.—181. Lead-bearing ore of all kinds, one and one half cent per pound on the lead contained therein: *Provided*, That on all importations of lead-bearing ores the duties shall be estimated at the port of entry, and a bond given in double the amount of such estimated duties for the transportation of the ores by common carriers bonded for the transportation of appraised or unappraised merchandise to properly equipped sampling or smelting establishments, whether designated as bonded warehouses or otherwise. On the arrival of the ores at such establishments they shall be sampled according to commercial methods under the supervision of Government officers, who shall be stationed at such establishments, and who shall submit the samples thus obtained to a Government assayer, designated by the Secretary of the Treasury, who shall make a proper assay of the sample, and report the result to the proper customs officers, and the import entries shall be liquidated thereon, except in case of ores that shall be removed to a bonded warehouse to be refined for exportation as provided by law. And the Secretary of the Treasury is authorized to make all necessary regulations to enforce the provisions of this paragraph.

182. Lead dross, lead bullion or base bullion, lead in pigs and bars, lead in any form not specially provided for in this act, old refuse lead run into blocks and bars, and old scrap lead fit only to be remanufactured; all the foregoing, two and one eighth cents per pound; lead in sheets, pipe, shot, glaziers' lead, and lead wire, two and one half cents per pound.

183. Metallic mineral substances in a crude state, and metals unwrought, not specially provided for in this act, twenty per centum ad valorem; monazite sand and thorite, six cents per pound.

184. Mica, unmanufactured, or rough trimmed only, six cents per pound and twenty per centum ad valorem; mica, cut or trimmed, twelve cents per pound and twenty per centum ad valorem.

185. Nickel, nickel oxide, alloy of any kind in which nickel is a component material of chief value, in pigs, ingots, bars, or sheets, six cents per pound.

186. Pens, metallic, except gold pens, twelve cents per gross.

187. Penholder tips, penholders, or parts thereof, and gold pens, twenty-five per centum ad valorem.

188. Pins with solid heads, without ornamentation, including hair, safety, hat, bonnet, and shawl pins; any of the foregoing composed wholly of brass, copper, iron, steel, or other base metal, not plated, and not commonly known as jewelry, thirty-five per centum ad valorem.

189. Quicksilver, seven cents per pound. The flasks, bottles, or other vessels in which quicksilver is imported shall be subject to the same rate of duty as they would be subjected to if imported empty.

190. Type metal, one and one half cent per pound for the lead contained therein; new types, twenty-five per centum ad valorem.

191. Watch movements, whether imported in cases or not, if having not more than seven jewels, thirty-five cents each; if having more than seven jewels and not more than eleven jewels, fifty cents each; if having more than eleven jewels and not more than fifteen jewels, seventy-five cents each; if having more than fifteen jewels and not more than seventeen jewels, one dollar and twenty-five cents each; if having more than seventeen

jewels, three dollars each, and in addition thereto, on all the foregoing, twenty-five per centum ad valorem; watch cases and parts of watches, including watch dials, chronometers, box or ship, and parts thereof, clocks and parts thereof, not otherwise provided for in this act, whether separately packed or otherwise, not composed wholly or in part of china, porcelain, parian, bisque, or earthenware, forty per centum ad valorem; all jewels for use in the manufacture of watches or clocks, ten per centum ad valorem.

192. Zinc in blocks or pigs, one and one half cent per pound; in sheets, two cents per pound; old and worn out, fit only to be remanufactured, one cent per pound.

193. Articles or wares not specially provided for in this act, composed wholly or in part of iron, steel, lead, copper, nickel, pewter, zinc, gold, silver, platinum, aluminum, or other metal, and whether partly or wholly manufactured, forty-five per centum ad valorem.

SCHEDULE D.—WOOD AND MANUFACTURES OF.

194. Timber hewn, sided, or squared (not less than eight inches square), and round timber used for spars or in building wharves, one cent per cubic foot.

195. Sawed boards, planks, deals, and other lumber of whitewood, aycamore, and basewood, one dollar per thousand feet board measure; sawed lumber, not specially provided for in this act, two dollars per thousand feet board measure; but when lumber of any sort is planed or finished, in addition to the rates herein provided, there shall be levied and paid for each side so planed or finished fifty cents per thousand feet board measure; and if planed on one side and tongued and grooved, one dollar per thousand feet board measure; and if planed on two sides and tongued and grooved, one dollar and fifty cents per thousand feet board measure; and in estimating board measure under this schedule no deduction shall be made on board measure on account of planing, tonguing, and grooving: *Provided*, That if any country or dependency shall impose an export duty upon saw logs, round unmanufactured timber, stave bolts, shingle bolts, or heading bolts, exported to the United States, or a discriminating charge upon boom sticks, or chains used by American citizens in towing logs, the amount of such export duty, tax, or other charge, as the case may be, shall be added as an additional duty to the duties imposed upon the articles mentioned in this paragraph when imported from such country or dependency.

196. Paving posts, railroad ties, and telephone, trolley, electric-light and telegraph poles of cedar or other woods, twenty per centum ad valorem.

197. Kindling wood in bundles not exceeding one quarter of a cubic foot each, three tenths of one cent per bundle; if in larger bundles, three tenths of one cent for each additional quarter of a cubic foot or fractional part thereof.

198. Sawed boards, planks, deals, and all forms of sawed cedar, lignum-vitæ, lancewood, ebony, box, grana-dilla, mahogany, rosewood, satinwood, and all other cabinet woods not further manufactured than sawed, fifteen per centum ad valorem; veneers of wood, and wood, unmanufactured, not specially provided for in this act, twenty per centum ad valorem.

199. Clapboards, one dollar and fifty cents per thousand.

200. Hubs for wheels, posts, heading bolts, stave bolts, last blocks, wagon blocks, oar blocks, heading blocks, and all like blocks or sticks, rough-hewn, sawed or bored, twenty per centum ad valorem; fence posts, ten per centum ad valorem.

201. Laths, twenty-five cents per one thousand pieces.

202. Pickets, palings, and staves of wood of all kinds, ten per centum ad valorem.

203. Shingles, thirty cents per thousand.

204. Casks, barrels, and hogsheds (empty), sugar-box shoeks, and packing boxes (empty), and packing-box shoeks, of wood, not specially provided for in this act, thirty per centum ad valorem.

205. Boxes, barrels, or other articles containing oranges, lemons, limes, grape fruit, shaddock, or pomelos, thirty per centum ad valorem: *Provided*, That the thin wood, so called, comprising the sides, tops, and bottoms of orange and lemon boxes of the growth and manufacture of the United States, exported as orange and lemon box shoeks, may be reimported in completed form, filled with oranges and lemons, by the payment of duty at one half the rate imposed on similar boxes of entirely foreign growth and manufacture.

306. Chair cane or reeds, wrought or manufactured from rattans or reeds, ten per centum ad valorem; osier or willow prepared for basket makers' use, twenty per centum ad valorem; manufactures of osier or willow, forty per centum ad valorem.

307. Toothpicks of wood or other vegetable substance, two cents per one thousand and fifteen per centum ad valorem; butchers' and packers' skewers of wood, forty cents per thousand.

308. House or cabinet furniture, of wood, wholly or partly finished, and manufactures of wood, or of which wood is the component material of chief value, not specially provided for in this act, thirty-five per centum ad valorem.

SCHEDULE E.—SUGAR, MOLASSES, AND MANUFACTURES OF.

309. Sugars not above number sixteen Dutch standard in color, tank bottoms, sirups of cane juice, melada, concentrated melada, concrete and concentrated molasses, testing by the polariscope not above seventy-five degrees, ninety-five one hundredths of one cent per pound, and for every additional degree shown by the polariscope test, thirty-five one thousandths of one cent per pound additional, and fractions of a degree in proportion; and on sugar above number sixteen Dutch standard in color, and on all sugar which has gone through a process of refining, one cent and ninety-five one hundredths of one cent per pound; molasses testing above forty degrees and not above fifty-six degrees, three cents per gallon; testing fifty-six degrees and above, six cents per gallon; sugar drainings and sugar sweepings shall be subject to duty as molasses or sugar, as the case may be, according to polariscope test: *Provided*, That nothing herein contained shall be so construed as to abrogate or in any manner impair or affect the provisions of the treaty of commercial reciprocity concluded between the United States and the King of the Hawaiian Islands on the thirteenth day of January, eighteen hundred and seventy-five, or the provision of any act of Congress heretofore passed for the execution of the same.

310. Maple sugar and maple sirup, four cents per pound; glucose or grape sugar, one and one half cent per pound; sugar cane in its natural state or unmanufactured, twenty per centum ad valorem.

311. Saccharine, one dollar and fifty cents per pound and ten per centum ad valorem.

312. Sugar candy and all confectionery not specially provided for in this act, valued at fifteen cents per pound or less, and on sugars after being refined, when tintured, colored, or in any way adulterated, four cents per pound and fifteen per centum ad valorem; valued at more than fifteen cents per pound, fifty per centum ad valorem. The weight and the value of the immediate coverings, other than the outer packing case or other covering, shall be included in the dutiable weight and the value of the merchandise.

SCHEDULE F.—TOBACCO AND MANUFACTURES OF.

313. Wrapper tobacco, and filler tobacco when mixed or packed with more than fifteen per centum of wrapper tobacco, and all leaf tobacco the product of two or more countries or dependencies when mixed or packed together, if unstemmed, one dollar and eighty-five cents per pound; if stemmed, two dollars and fifty cents per pound; filler tobacco not specially provided for in this act, if unstemmed, thirty-five cents per pound; if stemmed, fifty cents per pound.

314. The term wrapper tobacco as used in this act means that quality of leaf tobacco which is suitable for cigar wrappers, and the term filler tobacco means all other leaf tobacco. Collectors of customs shall not permit entry to be made, except under regulations to be prescribed by the Secretary of the Treasury, of any leaf tobacco, unless the invoices of the same shall specify in detail the character of such tobacco, whether wrapper or filler, its origin and quality. In the examination for classification of any imported leaf tobacco, at least one bale, box, or package in every ten, and at least one in every invoice, shall be examined by the appraiser or person authorized by law to make such examination, and at least ten hands shall be examined in each examined bale, box, or package.

315. All other tobacco, manufactured or unmanufactured, not specially provided for in this act, fifty-five cents per pound.

316. Snuff and snuff flour, manufactured of tobacco, ground dry or damp, and pickled, scented, or otherwise, of all descriptions, fifty-five cents per pound.

317. Cigars, cigarettes, cheroots of all kinds, four dollars and fifty cents per hundred and twenty-five per centum ad valorem; and paper cigars and cigarettes, including wrappers, shall be subject to the same duties as are herein imposed upon cigars.

SCHEDULE G.—AGRICULTURAL PRODUCTS AND PRODUCTS THEREOF.

Animals, Live.—218. Cattle, if less than one year old, two dollars per head; all other cattle, if valued at not more than fourteen dollars per head, three dollars and seventy-five cents per head; if valued at more than fourteen dollars per head, twenty-seven and one-half per centum ad valorem.

219. Swine, one dollar and fifty cents per head.

220. Horses and mules, valued at one hundred and fifty dollars or less per head, thirty dollars per head, if valued at over one hundred and fifty dollars, twenty-five per centum ad valorem.

221. Sheep, one year old or over, one dollar and fifty cents per head; less than one year old, seventy-five cents per head.

222. All other live animals, not specially provided for in this act, twenty per centum ad valorem.

Grain, Seeds and Farinaceous Substances.—223. Barley, thirty cents per bushel of forty-eight pounds.

224. Barley malt, forty-five cents per bushel of thirty-four pounds.

225. Barley, pearled, patent, or hulled, two cents per pound.

226. Buckwheat, fifteen cents per bushel of forty-eight pounds.

227. Corn or maize, fifteen cents per bushel of fifty-six pounds.

228. Corn meal, twenty cents per bushel of forty-eight pounds.

229. Macaroni, vermicelli, and all similar preparations, one and one half cent per pound.

230. Oats, fifteen cents per bushel.

231. Oatmeal and rolled oats, one cent per pound; oat hulls, ten cents per hundred pounds.

232. Rice, cleaned, two cents per pound; uncleaned rice, or rice free of the outer hull and still having the inner cuticle on, one and one fourth cent per pound; rice flour, and rice meal, and rice broken which will pass through a sieve, known commercially as number twelve wire sieve, one fourth of one cent per pound; paddy, or rice having the outer hull on, three fourths of one cent per pound.

233. Rye, ten cents per bushel; rye flour, one half of one cent per pound.

234. Wheat, twenty-five cents per bushel.

235. Wheat flour, twenty-five per centum ad valorem.

Dairy Products.—236. Butter, and substitutes therefor, six cents per pound.

237. Cheese, and substitutes therefor, six cents per pound.

238. Milk, fresh, two cents per gallon.

239. Milk, preserved or condensed, or sterilized by heating or other processes, including weight of immediate coverings, two cents per pound; sugar of milk, five cents per pound.

Farm and Field Products.—240. Beans, forty-five cents per bushel of sixty pounds.

241. Beans, peas, and mushrooms, prepared or preserved, in tins, jars, bottles, or similar packages, two and one half cents per pound, including the weight of all tins, jars, and other immediate coverings; all vegetables, prepared or preserved, including pickles and sauces of all kinds, not specially provided for in this act, and fish paste or sauce, forty per centum ad valorem.

242. Cabbages, three cents each.

243. Cider, five cents per gallon.

244. Eggs, not specially provided for in this act, five cents per dozen.

245. Eggs, yolk of, twenty-five per centum ad valorem; albumen, egg or blood, three cents per pound; dried blood, when soluble, one and one half cent per pound.

246. Hay, four dollars per ton.

247. Honey, twenty cents per gallon.

248. Hops, twelve cents per pound; hop extract and lupulin, fifty per centum ad valorem.

249. Onions, forty cents per bushel; garlic, one cent per pound.

250. Peas, green, in bulk or in barrels, tins, or similar packages, and seed peas, forty cents per bushel of sixty pounds; peas, dried, not specially provided for,

thirty cents per bushel; split peas, forty cents per bushel of sixty pounds; peas in cartons, papers, or other small packages, one cent per pound.

251. Orchids, palms, dracenas, crotons and azaleas, tulips, hyacinths, narcissi, jonquils, lilies, lilies of the valley, and all other bulbs, bulbous roots, or corins, which are cultivated for their flowers, and natural flowers of all kinds, preserved or fresh, suitable for decorative purposes, twenty-five per centum ad valorem.

252. Stocks, cuttings or seedlings of Myrobalan plum, Mahaleb, or Mazzard cherry, three years old or less, fifty cents per thousand plants and fifteen per centum ad valorem; stocks, cuttings or seedlings of pear, apple, quince, and the St. Julien plum, three years old or less, and evergreen seedlings, one dollar per thousand plants and fifteen per centum ad valorem; rose plants, budded, grafted, or grown on their own roots, two and one half cents each; stocks, cuttings and seedlings of all fruit and ornamental trees, deciduous and evergreen, shrubs and vines, manetti, multiflora, and brier rose, and all trees, shrubs, plants, and vines, commonly known as nursery or greenhouse stock, not specially provided for in this act, twenty-five per centum ad valorem.

253. Potatoes, twenty-five cents per bushel of sixty pounds.

254. Seeds: Castor beans or seeds, twenty-five cents per bushel of fifty pounds; flaxseed or linseed and other oil seeds not specially provided for in this act, twenty-five cents per bushel of fifty-six pounds; poppy seed, fifteen cents per bushel; but no drawback shall be allowed upon oil cake made from imported seed, nor shall any allowance be made for dirt or other impurities in any seed; seeds of all kinds not specially provided for in this act, thirty per centum ad valorem.

255. Straw, one dollar and fifty cents per ton.

256. Teazles, thirty per centum ad valorem.

257. Vegetables in their natural state, not specially provided for in this act, twenty-five per centum ad valorem.

Fish.—258. Fish known or labeled as anchovies, sardines, sprats, brislings, sardels, or sardellen, packed in oil or otherwise, in bottles, jars, tin boxes, or cans, shall be dutiable as follows: When in packages containing seven and one half cubic inches or less, one and one half cent per bottle, jar, box, or can; containing more than seven and one half and not more than twenty-one cubic inches, two and one half cents per bottle, jar, box, or can; containing more than twenty-one and not more than thirty-three cubic inches, five cents per bottle, jar, box, or can; containing more than thirty-three and not more than seventy cubic inches, ten cents per bottle, jar, box, or can; if in other packages, forty per centum ad valorem. All other fish (except shellfish), in tin packages, thirty per centum ad valorem; fish in packages containing less than one half barrel, and not specially provided for in this act, thirty per centum ad valorem.

259. Fresh-water fish not specially provided for in this act, one fourth of one cent per pound.

260. Herrings, pickled or salted, one half of one cent per pound; herrings, fresh, one fourth of one cent per pound.

261. Fish, fresh, smoked, dried, salted, pickled, frozen, packed in ice or otherwise prepared for preservation, not specially provided for in this act, three fourths of one cent per pound; fish, skinned or boned, one and one fourth cent per pound; mackerel, halibut, or salmon, fresh, pickled, or salted, one cent per pound.

Fruits and Nuts.—262. Apples, peaches, quinces, cherries, plums, and pears, green or ripe, twenty-five cents per bushel; apples, peaches, pears, and other edible fruits, including berries, when dried, desiccated, evaporated, or prepared in any manner, not specially provided for in this act, two cents per pound; berries, edible, in their natural condition, one cent per quart; cranberries, twenty-five per centum ad valorem.

263. Combs, sweetmeats, and fruits preserved in sugar, molasses, spirits, or in their own juices, not specially provided for in this act, one cent per pound and thirty-five per centum ad valorem; if containing over ten per centum of alcohol and not specially provided for in this act, thirty-five per centum ad valorem and in addition two dollars and fifty cents per proof gallon on the alcohol contained therein in excess of ten per centum; jellies of all kinds, thirty-five per centum ad valorem; pineapples preserved in their own juice, twenty-five per centum ad valorem.

264. Figs, plums, prunes, and prunelles, two cents per pound; raisins and other dried grapes, two and one half

cents per pound; dates, one half of one cent per pound; currants. Zante or other, two cents per pound; olives, green or prepared, in bottles, jars, or similar packages, twenty-five cents per gallon; in casks or otherwise than in bottles, jars, or similar packages, fifteen cents per gallon.

265. Grapes in barrels or other packages, twenty cents per cubic foot of capacity of barrels or packages.

266. Oranges, lemons, limes, grape fruit, shaddock, or pomelos, one cent per pound.

267. Orange peel or lemon peel, preserved, candied, or dried, and cocoanut meat or copra desiccated, shredded, cut, or similarly prepared, two cents per pound; citron or citron peel, preserved, candied, or dried, four cents per pound.

268. Pineapples, in barrels and other packages, seven cents per cubic foot of the capacity of barrels or packages; in bulk, seven dollars per thousand.

Nuts: 269. Almonds, not shelled, four cents per pound; clear almonds, shelled, six cents per pound.

270. Filberts and walnuts of all kinds, not shelled, three cents per pound; shelled, five cents per pound.

271. Peanuts or ground beans, unshelled, one half of one cent per pound; shelled, one cent per pound.

272. Nuts of all kinds, shelled or unshelled, not specially provided for in this act, one cent per pound.

Meat Products.—273. Bacon and hams, five cents per pound.

274. Fresh beef, veal, mutton, and pork, two cents per pound.

275. Meats of all kinds, prepared or preserved, not specially provided for in this act, twenty-five per centum ad valorem.

276. Extract of meat, not specially provided for in this act, thirty-five cents per pound; fluid extract of meat, fifteen cents per pound, but the dutiable weight of the extract of meat and of the fluid extract of meat shall not include the weight of the package in which the same is imported.

277. Lard, two cents per pound.

278. Poultry, live, three cents per pound; dressed, five cents per pound.

279. Tallow, three fourths of one cent per pound; wool grease, including that known commercially as degrass or brown wool grease, one half of one cent per pound.

Miscellaneous Products.—280. Chicory root, raw, dried, or undried, but unground, one cent per pound; chicory root, burnt or roasted, ground or granulated, or in rolls, or otherwise prepared, and not specially provided for in this act, two and one half cents per pound.

281. Chocolate and cocoa, prepared or manufactured, not specially provided for in this act, valued at not over fifteen cents per pound, two and one half cents per pound; valued above fifteen and not above twenty-four cents per pound, two and one half cents per pound and ten per centum ad valorem; valued above twenty-four and not above thirty-five cents per pound, five cents per pound and ten per centum ad valorem; valued above thirty-five cents per pound, fifty per centum ad valorem. The weight and value of all coverings, other than plain wooden, shall be included in the dutiable weight and value of the foregoing merchandise; powdered cocoa, unsweetened, five cents per pound.

282. Cocoa butter or cocoa butterine, three and one half cents per pound.

283. Dandelion root and acorns prepared, and articles used as coffee, or as substitutes for coffee not specially provided for in this act, two and one half cents per pound.

284. Salt in bags, sacks, barrels, or other packages, twelve cents per one hundred pounds; in bulk, eight cents per one hundred pounds: *Provided*, That imported salt in bond may be used in curing fish taken by vessels licensed to engage in the fisheries, and in curing fish on the shores of the navigable waters of the United States, under such regulations as the Secretary of the Treasury shall prescribe; and upon proof that the salt has been used for either of the purposes stated in this proviso, the duties on the same shall be remitted: *Provided further*, That exporters of meats, whether packed or smoked, which have been cured in the United States with imported salt, shall, upon satisfactory proof, under such regulations as the Secretary of the Treasury shall prescribe, that such meats have been cured with imported salt, have refunded to them from the Treasury the duties paid on the salt so used in curing such exported meats, in amounts not less than one hundred dollars.

235. Starch, including all preparations, from whatever substance produced, fit for use as starch, one and one half cent per pound.

256. Dextrine, burnt starch, gum substitute, or British gum, two cents per pound.

257. Spices: Mustard, ground or prepared, in bottles or otherwise, ten cents per pound; capsicum or red pepper, or cayenne pepper, two and one half cents per pound; sage, one cent per pound; spices not specially provided for in this act, three cents per pound.

288. Vinegar, seven and one half cents per proof gallon. The standard proof for vinegar shall be taken to be that strength which requires thirty-five grains of bicarbonate of potash to neutralize one ounce troy of vinegar.

SCHEDULE II.—SPIRITS, WINES, AND OTHER BEVERAGES.

Spirits.—289. Brandy and other spirits manufactured or distilled from grain or other materials, and not specially provided for in this act, two dollars and twenty-five cents per proof gallon.

290. Each and every gauge or wine gallon of measurement shall be counted as at least one proof gallon; and the standard for determining the proof of brandy and other spirits or liquors of any kind imported shall be the same as that which is defined in the laws relating to internal revenue: *Provided*, That it shall be lawful for the Secretary of the Treasury, in his discretion, to authorize the ascertainment of the proof of wines, cordials, or other liquors, by distillation or otherwise, in cases where it is impracticable to ascertain such proof by the means prescribed by existing law or regulations: *And provided further*, That any brandy or other spirituous or distilled liquors imported in any sized cask, bottle, jug, or other package, of or from any country, dependency, or province under whose laws similar sized casks, bottles, jugs, or other packages of distilled spirits, wine, or other beverage put up or filled in the United States are denied entrance into such country, dependency, or province, shall be forfeited to the United States; and any brandy or other spirituous or distilled liquor imported in a cask of less capacity than ten gallons from any country shall be forfeited to the United States.

291. On all compounds or preparations of which distilled spirits are a component part of chief value, there shall be levied a duty not less than that imposed upon distilled spirits.

292. Cordials, liqueurs, arrack, absinthe, kirschwasser, ratafia, and other spirituous beverages or bitters of all kinds, containing spirits, and not specially provided for in this act, two dollars and twenty-five cents per proof gallon.

298. No lower rate or amount of duty shall be levied, collected, and paid on brandy, spirits, and other spirituous beverages than that fixed by law for the description of first proof; but it shall be increased in proportion for any greater strength than the strength of first proof, and all imitations of brandy or spirits or wines imported by any names whatever shall be subject to the highest rate of duty provided for the genuine articles respectively intended to be represented, and in no case less than one dollar and fifty cents per gallon.

294. Bay rum or bay water, whether distilled or compounded, of first proof, and in proportion for any greater strength than first proof, one dollar and fifty cents per gallon.

Wines.—99c. Champagne and all other sparkling wines, in bottles containing each not more than one quart and more than one pint, eight dollars per dozen; containing not more than one pint each and more than one half pint, four dollars per dozen; containing one half pint each or less, two dollars per dozen; in bottles or other vessels containing more than one quart each, in addition to eight dollars per dozen bottles, on the quantity in excess of one quart, at the rate of two dollars and fifty cents per gallon; but no separate or additional duty shall be levied on the bottles.

296. Still wines, including ginger wine or ginger cordial and vermouth, in casks or packages other than bottles or jugs, if containing fourteen per centum or less of absolute alcohol, forty cents per gallon; if containing more than fourteen per centum of absolute alcohol, fifty cents per gallon. In bottles or jugs, per case of one dozen bottles or jugs, containing each not more than one quart and more than one pint, or twenty-four bottles or jugs containing each not more than one pint, one dollar and sixty cents per case; and any excess beyond these quantities found in such bottles or jugs shall be subject to a

duty of five cents per pint, or fractional part thereof, but no separate or additional duty shall be assessed on the bottles or jugs: *Provided*, That any wines, ginger cordial, or vermouth imported containing more than twenty four per centum of alcohol shall be assessed as spirits and pay duty accordingly: *And provided further*, That there shall be no constructive or other allowance for breakage, leakage, or damage on wines, liquors, cordials, or distilled spirits. Wines, cordials, brandy, and other spirituous liquors, including bitters of all kinds, and any rum or bay water, imported in bottles or jugs, shall be packed in packages containing not less than one dozen bottles or jugs in each package, or duty shall be paid as if such package contained at least one dozen bottles or jugs, and in addition thereto, duty shall be collected on the bottles or jugs at the rates which would be chargeable thereon if imported empty. The percentage of alcohol in wines and fruit juices shall be determined in such manner as the Secretary of the Treasury shall by regulation prescribe.

397. Ale, porter, and beer, in bottles or jugs, forty cents per gallon, but no separate or additional duty shall be assessed on the bottles or jugs; otherwise than in bottles or jugs, twenty cents per gallon.

298. Malt extract, fluid, in casks, twenty cents per gallon; in bottles or jugs, forty cents per gallon; solid or condensed, forty per centum ad valorem.

999. Cherry juice and prune juice, or prune wine, and other fruit juices not specially provided for in this act, containing no alcohol or not more than eighteen per centum of alcohol, sixty cents per gallon; if containing more than eighteen per centum of alcohol, sixty cents per gallon, and in addition thereto two dollars and seven cents per proof gallon on the alcohol contained therein.

300. Ginger ale, ginger beer, lemonade, soda water, and other similar beverages containing no alcohol in plain green or colored, molded or pressed, glass bottles, containing each not more than three fourths of a pint, eighteen cents per dozen; containing more than three fourths of a pint each and not more than one and one half pints, twenty-eight cents per dozen; but no separate or additional duty shall be assessed on the bottles; if imported otherwise than in plain green or colored, molded or pressed, glass bottles, or in such bottles containing more than one and one half pints each, fifty cents per gallon and in addition thereto duty shall be collected on the bottles, or other coverings, at the rates which would be chargeable thereon if imported empty.

301. All mineral waters and all imitations of natural mineral waters, and all artificial mineral waters not especially provided for in this act, in green or colored glass bottles, containing not more than one pint, twenty cents per dozen bottles. If containing more than one pint and not more than one quart, thirty cents per dozen bottles. But no separate duty shall be assessed upon the bottles. If imported otherwise than in plain green or colored glass bottles, or if imported in such bottles containing more than one quart, twenty-four cents per gallon, and in addition thereto duty shall be collected upon the bottles or other covering at the same rates that would be charged thereon if imported empty or separately.

SCHEDULE I.—COTTON MANUFACTURE.

302. Cotton thread and corded yarn, warps or warp yarn, in singles, whether on beams or in bundles, skeins or cops, or in any other form, except spool thread of cotton hereinafter provided for, not colored, bleached, dyed, or advanced beyond the condition of singles by grouping or twisting two or more single yarns together, three cents per pound on all numbers up to and including number fifteen, one fifth of a cent per number per pound on all numbers exceeding number fifteen and up to and including number thirty, and one fourth of a cent per number per pound on all numbers exceeding number thirty; colored, bleached, dyed, combed, or advanced beyond the condition of singles by grouping or twisting two or more single yarns together, whether on beams, or in bundles, skeins or cops, or in any other form, except spool threads of cotton hereinafter provided for, six cents per pound on all numbers up to and including number twenty, and on all numbers exceeding number twenty and up to number eighty, one fourth of one cent per number per pound; on number eighty and above, three tenths of one cent per number per pound; cotton and rayon, twisted, silver, or plying, forty-five percent ad valorem.

303. Spool thread of cotton, including spool cotton for knitting, and embroidery cottons on spools or reels, containing no

each spool or reel not exceeding one hundred yards of thread, six cents per dozen; exceeding one hundred yards on each spool or reel, for every additional hundred yards or fractional part thereof in excess of one hundred, six cents per dozen spools or reels; if otherwise than on spools or reels, one half of one cent for each one hundred yards or fractional part thereof: *Provided*, That in no case shall the duty be assessed upon a less number of yards than is marked on the spools or reels.

304. Cotton cloth not bleached, dyed, colored, stained, painted, or printed, and not exceeding fifty threads to the square inch, counting the warp and filling, one cent per square yard; if bleached, one and one fourth cent per square yard; if dyed, colored, stained, painted, or printed, two cents per square yard.

305. Cotton cloth, not bleached, dyed, colored, stained, painted, or printed, exceeding fifty and not exceeding one hundred threads to the square inch, counting the warp and filling, and not exceeding six square yards to the pound, one and one fourth cent per square yard; exceeding six and not exceeding nine square yards to the pound, one and one half cent per square yard; exceeding nine square yards to the pound, one and three fourths cent per square yard; if bleached, and not exceeding six square yards to the pound, one and one half cent per square yard; exceeding six and not exceeding nine square yards to the pound, one and three fourths cent per square yard; exceeding nine square yards to the pound, two and one fourth cents per square yard; if dyed, colored, stained, painted, or printed, and not exceeding six square yards to the pound, two and three fourths cents per square yard; exceeding six and not exceeding nine square yards to the pound, three and one fourth cents per square yard; exceeding nine square yards to the pound, three and one half cents per square yard: *Provided*, That on all cotton cloth not exceeding one hundred threads to the square inch, counting the warp and filling, not bleached, dyed, colored, stained, painted, or printed, valued at over seven cents per square yard, twenty-five per centum ad valorem; bleached, valued at over nine cents per square yard, twenty-five per centum ad valorem; and dyed, colored, stained, painted, or printed, valued at over twelve cents per square yard, there shall be levied, collected, and paid a duty of thirty per centum ad valorem.

306. Cotton cloth, not bleached, dyed, colored, stained, painted, or printed, exceeding one hundred and not exceeding one hundred and fifty threads to the square inch, counting the warp and filling, and not exceeding four square yards to the pound, one and one half cent per square yard; exceeding four and not exceeding six square yards to the pound, two cents per square yard; exceeding six and not exceeding eight square yards to the pound, two and one half cents per square yard; exceeding eight square yards to the pound, two and three fourths cents per square yard; if bleached, and not exceeding four square yards to the pound, two and one half cents per square yard; exceeding four and not exceeding six square yards to the pound, three cents per square yard; exceeding six and not exceeding eight square yards to the pound, three and one half cents per square yard; exceeding eight square yards to the pound, three and three fourths cents per square yard; if dyed, colored, stained, painted, or printed, and not exceeding four square yards to the pound, three and one half cents per square yard; exceeding four and not exceeding six square yards to the pound, three and three fourths cents per square yard; exceeding six and not exceeding eight square yards to the pound, four and one fourth cents per square yard; exceeding eight square yards to the pound, four and one half cents per square yard: *Provided*, That, on all cotton cloth exceeding one hundred and not exceeding one hundred and fifty threads to the square inch, counting the warp and filling, not bleached, dyed, colored, stained, painted, or printed, valued at over nine cents per square yard, thirty per centum ad valorem; bleached, valued at over eleven cents per square yard, thirty-five per centum ad valorem; dyed, colored, stained, painted, or printed, valued at over twelve and one half cents per square yard, there shall be levied, collected, and paid a duty of thirty-five per centum ad valorem.

307. Cotton cloth not bleached, dyed, colored, stained, painted, or printed, exceeding one hundred and fifty and not exceeding two hundred threads to the square inch, counting the warp and filling, and not exceeding three and one half square yards to the pound, two cents per square yard; exceeding three and one half and not ex-

ceeding four and one half square yards to the pound, two and three fourths cents per square yard; exceeding four and one half and not exceeding six square yards to the pound, three cents per square yard; exceeding six square yards to the pound, three and one half cents per square yard; if bleached, and not exceeding three and one half square yards to the pound, two and three fourths cents per square yard; exceeding three and one half and not exceeding four and one half square yards to the pound, three and one half cents per square yard; exceeding four and one half and not exceeding six square yards to the pound, four cents per square yard; exceeding six square yards to the pound, four and one fourth cents per square yard; if dyed, colored, stained, painted, or printed, and not exceeding three and one half square yards to the pound, four and one fourth cents per square yard; exceeding three and one half and not exceeding four and one half square yards to the pound, four and one half cents per square yard; exceeding four and one half and not exceeding six square yards to the pound, four and three fourths cents per square yard; exceeding six square yards to the pound, five cents per square yard: *Provided*, That on all cotton cloth exceeding one hundred and fifty and not exceeding two hundred threads to the square inch, counting the warp and filling, not bleached, dyed, colored, stained, painted, or printed, valued at over ten cents per square yard, thirty-five per centum ad valorem; bleached, valued at over twelve cents per square yard, thirty-five per centum ad valorem; dyed, colored, stained, painted, or printed, valued at over twelve and one half cents per square yard, there shall be levied, collected, and paid a duty of forty per centum ad valorem.

308. Cotton cloth not bleached, dyed, colored, stained, painted, or printed, exceeding two hundred and not exceeding three hundred threads to the square inch, counting the warp and filling, and not exceeding two and one half square yards to the pound, three and one half cents per square yard; exceeding two and one half and not exceeding three and one half square yards to the pound, four cents per square yard; exceeding three and one half and not exceeding five square yards to the pound, four and one half cents per square yard; exceeding five square yards to the pound, five cents per square yard; if bleached, and not exceeding two and one half square yards to the pound, four and one half cents per square yard; exceeding two and one half and not exceeding three and one half square yards to the pound, five cents per square yard; exceeding three and one half and not exceeding five square yards to the pound, five and one half cents per square yard; exceeding five square yards to the pound, six cents per square yard; if dyed, colored, stained, painted, or printed, and not exceeding three and one half square yards to the pound, six and one fourth cents per square yard; exceeding three and one half square yards to the pound, seven cents per square yard: *Provided*, That on all such cotton cloths not bleached, dyed, colored, stained, painted, or printed, valued at over twelve and one half cents per square yard; bleached, valued at over fifteen cents per square yard; and dyed, colored, stained, painted, or printed, valued at over seventeen and one half cents per square yard, there shall be levied, collected, and paid a duty of forty per centum ad valorem.

309. Cotton cloth not bleached, dyed, colored, stained, painted, or printed, exceeding three hundred threads to the square inch, counting the warp and filling, and not exceeding two square yards to the pound, four cents per square yard; exceeding two and not exceeding three square yards to the pound, four and one half cents per square yard; exceeding three and not exceeding four square yards to the pound, five cents per square yard; exceeding four square yards to the pound, five and one half cents per square yard; if bleached and not exceeding two square yards to the pound, five cents per square yard; exceeding two and not exceeding three square yards to the pound, five and one half cents per square yard; exceeding three and not exceeding four square yards to the pound, six cents per square yard; exceeding four square yards to the pound, six and one half cents per square yard; if dyed, colored, stained, painted, or printed, and not exceeding three square yards to the pound, six and one half cents per square yard; exceeding three square yards to the pound, eight cents per square yard: *Provided*, That on all such cotton cloths not bleached, dyed, colored, stained, painted, or printed, valued at over fourteen cents per square yard; bleached,

valued at over sixteen cents per square yard, and dyed, colored, stained, painted, or printed, valued at over twenty cents per square yard, there shall be levied, collected, and paid a duty of forty per centum ad valorem.

310. The term cotton cloth, or cloth, wherever used in the paragraphs of this schedule, unless otherwise specially provided for, shall be held to include all woven fabrics of cotton in the piece or otherwise, whether figured, fancy, or plain, the warp and filling threads of which can be counted by unraveling or other practicable means.

311. Cloth, composed of cotton or other vegetable fiber and silk, whether known as silk-striped sleeve linings, silk stripes, or otherwise, of which cotton is the component material of chief value, eight cents per square yard and thirty per centum ad valorem: *Provided*, That no such cloth shall pay a less rate of duty than fifty per centum ad valorem. Cotton cloth, filled or coated, three cents per square yard and twenty per centum ad valorem.

312. Handkerchiefs or mufflers composed of cotton, whether in the piece or otherwise and whether finished or unfinished, if not hemmed, or hemmed only, shall pay the same rate of duty on the cloth contained therein as is imposed on cotton cloth of the same description, weight, and count of threads to the square inch; but such handkerchiefs or mufflers shall not pay a less rate of duty than forty-five per centum ad valorem. If such handkerchiefs or mufflers are hemstitched, or imitation hemstitched, or reversed, or have drawn threads, they shall pay a duty of ten per centum ad valorem in addition to the duty hereinbefore prescribed, and in no case less than fifty-five per centum ad valorem; if such handkerchiefs or mufflers are embroidered in any manner, whether with an initial letter, monogram, or otherwise, by hand or machinery, or are tumbled, appliqued, or trimmed wholly or in part with lace or with tucking or insertion, they shall not pay a less rate of duty than sixty per centum ad valorem.

313. Cotton cloth in which other than the ordinary warp and filling threads have been introduced into the process of weaving to form a figure, whether known as lappets or otherwise, and whether unbleached, bleached, dyed, colored, stained, painted, or printed, shall pay, in addition to the duty herein provided for other cotton cloth of the same description, or condition, weight, and count of threads to the square inch, one cent per square yard if valued at not more than seven cents per square yard, and two cents per square yard if valued at more than seven cents per square yard.

314. Clothing, ready-made, and articles of wearing apparel of every description, including neckties or neckwear composed of cotton or other vegetable fiber, or of which cotton or other vegetable fiber is the component material of chief value, made up or manufactured, wholly or in part, by the tailor, seamstress, or manufacturer, and not otherwise provided for in this act, fifty per centum ad valorem: *Provided*, That any outside garment provided for in this paragraph having India rubber as a component material shall pay a duty of fifteen cents per pound and fifty per centum ad valorem.

315. Plushes, velvets, velveteens, corduroys, and all pile fabrics, cut or uncut; any of the foregoing composed of cotton or other vegetable fiber, not bleached, dyed, colored, stained, painted, or printed, nine cents per square yard and twenty-five per centum ad valorem; if bleached, dyed, colored, stained, painted, or printed, twelve cents per square yard and twenty-five per centum ad valorem: *Provided*, That corduroys composed of cotton or other vegetable fiber, weighing seven ounces or over per square yard, shall pay a duty of eighteen cents per square yard and twenty-five per centum ad valorem: *Provided further*, That manufactures or articles in any form including such as are commonly known as bias dress facings or skirt bindings, made or cut from plushes, velvets, velveteens, corduroys, or other pile fabrics composed of cotton or other vegetable fiber, shall be subject to the foregoing rates of duty and in addition thereto ten per centum ad valorem: *Provided further*, That none of the articles or fabrics provided for in this paragraph shall pay a less rate of duty than forty-seven and one half per centum ad valorem.

316. Curtains, table covers, and all articles manufactured of cotton chenille or of which cotton chenille is the component material of chief value, fifty per centum ad valorem.

317. Stockings, hose, and half-hose, made on knitting machines or frames, composed of cotton or other vegeta-

ble fiber, and not otherwise specially provided for in this act, thirty per centum ad valorem.

318. Stockings, hose, and half-hose, made on knitting machines or frames, or knit by hand, and of such as are commercially known as seamless stockings, hose, and half-hose, and clunked stockings, hose, and half-hose, any of the above composed of cotton or other vegetable fiber, finished or unfinished, valued at not more than one dollar per dozen pairs, fifty cents per dozen pairs; at more than one dollar per dozen pairs, and not more than one dollar and fifty cents per dozen pairs, eighty cents per dozen pairs; valued at more than one dollar and fifty cents per dozen pairs, and not more than two dollars per dozen pairs, seventy cents per dozen pairs; valued at more than two dollars per dozen pairs, and not more than three dollars per dozen pairs, one dollar and twenty cents per dozen pairs; valued at more than three dollars per dozen pairs and not more than five dollars per dozen pairs, two dollars per dozen pairs; and in addition, there to, upon all the foregoing, fifteen per centum ad valorem; valued at more than five dollars per dozen pairs, fifty-five per centum ad valorem.

319. Shirts and drawers, pants, vests, union suits, combination suits, ties, sweaters, coat covers, and all underwear of every description made wholly or in part on knitting machines or frames or knit by hand, finished or unfinished, not including stockings, hose, and half-hose, composed of cotton or other vegetable fiber, valued at not more than one dollar and fifty cents per dozen, eighty cents per dozen and fifteen per centum ad valorem; valued at more than one dollar and fifty cents per dozen and not more than three dollars per dozen, one dollar and ten cents per dozen; and in addition thereto fifteen per centum ad valorem; valued at more than three dollars per dozen and not more than five dollars per dozen, one dollar and fifty cents per dozen, and in addition thereto twenty-five per centum ad valorem; valued at more than five dollars per dozen and not more than seven dollars per dozen, one dollar and seventy-five cents per dozen, and in addition thereto thirty-five per centum ad valorem; valued at more than seven dollars per dozen and not more than fifteen dollars per dozen, two dollars and twenty-five cents per dozen, and in addition thereto thirty-five per centum ad valorem; valued above fifteen dollars per dozen, fifty per centum ad valorem.

320. Bandings, beltings, bindings, home casings, cords, garters, lining for bicycle tires, ribbons, suspenders and braces, tapes, tubing, and webs or webbing, any of the foregoing articles made of cotton or other vegetable fiber, whether composed in part of India rubber or otherwise, and not embroidered by hand or machinery, forty-five per centum ad valorem; spindle banding, woven, braided, or twisted lamp, stove, or candle wicking made of cotton or other vegetable fiber, ten cents per pound and fifteen per centum ad valorem; loom harness or heads made of cotton or other vegetable fiber, or of which cotton or other vegetable fiber is the component material of chief value, fifty cents per pound and twenty-five per centum ad valorem; boot, shoe, and corset linings made of cotton or other vegetable fiber, twenty-five cents per pound and fifteen per centum ad valorem; labels for garments or other articles, composed of cotton or other vegetable fiber, fifty cents per pound and thirty per centum ad valorem.

321. Cotton table damask, forty per centum ad valorem; cotton duck, thirty-five per centum ad valorem.

322. All manufactures of cotton not specially provided for in this act, forty-five per centum ad valorem.

SCHEDULE J—FLAX, HEMP, AND JUTE, AND MANUFACTURES OF.

323. Flax straw, five dollars per ton.

324. Flax, not hatched or dressed, one cent per pound.

325. Flax, hatched, known as "dressed flax," three cents per pound.

326. Tow of flax, twenty dollars per ton.

327. Hemp, and tow of hemp, twenty dollars per ton; hemp, hatched, known as "line of hemp," forty cents per ton.

328. Single yarns made of jute, not finer than No. 10 or number, one cent per pound and twenty-five per centum ad valorem; if finer than five lea or number, thirty per centum ad valorem.

329. Cables and cordage composed of flax, hemp, or jute, fiber, manila, sisal grass or sunn, or of any of them, one cent per pound and twenty-five per centum ad valorem; made of hemp, tarred or untarred, one cent per pound and

330. Threads, twines, or cords, made from yarn not finer than five lea or number, composed of flax, hemp, or ramie, or of which these substances or either of them is the component material of chief value, thirteen cents per pound; if made from yarn finer than five lea or number, three-fourths of one cent per pound additional for each lea or number, or part of a lea or number, in excess of five.

331. Single yarns in the gray, made of flax, hemp, or ramie, or a mixture of any of them, not finer than eight lea or number, seven cents per pound; finer than eight lea or number and not finer than eighty lea or number, forty per centum ad valorem; single yarns, made of flax, hemp, or ramie, or a mixture of any of them, finer than eighty lea or number, fifteen per centum ad valorem.

332. Flax gill netting, nets, webs, and seines shall pay the same duty per pound as is imposed in this schedule upon the thread, twine, or cord of which they are made, and in addition thereto twenty-five per centum ad valorem.

333. Floor mattings, plain, fancy, or figured, manufactured from straw, round or split, or other vegetable substances not otherwise provided for, including what are commonly known as Chinese, Japanese, and India straw mattings, valued at not exceeding ten cents per square yard, three cents per square yard; valued at exceeding ten cents per square yard, seven cents per square yard and twenty-five per centum ad valorem.

334. Carpets, carpeting, mats, and rugs made of flax, hemp, jute, or other vegetable fiber (except cotton), valued at not exceeding fifteen cents per square yard, five cents per square yard and thirty-five per centum ad valorem; valued above fifteen cents per square yard, ten cents per square yard and thirty-five per centum ad valorem.

335. Hydraulic hose, made in whole or in part of flax, hemp, ramie, or jute, twenty cents per pound.

336. Tapes composed wholly or in part of flax, woven with or without metal threads, on reels, spools, or otherwise, and designed expressly for use in the manufacture of measuring tapes, forty per centum ad valorem.

337. Oilcloth for floors, stamped, painted, or printed, including linoleums or corticine, figured or plain, and all other oilcloth (except silk oilcloth) under twelve feet in width not specially provided for herein, eight cents per square yard and fifteen per centum ad valorem; oilcloth for floors and linoleum or corticine, twelve feet and over in width, inlaid linoleum or corticine, and cork carpets, twenty cents per square yard and twenty per centum ad valorem; waterproof cloth, composed of cotton or other vegetable fiber, whether composed in part of India rubber or otherwise, ten cents per square yard and twenty per centum ad valorem.

338. Shirt collars and cuffs, composed of cotton, forty-five cents per dozen pieces and fifteen per centum ad valorem; composed in whole or in part of linen, forty cents per dozen pieces and twenty per centum ad valorem.

339. Laces, lace window curtains, tidies, pillow shams, bed sets, insertings, flouncings, and other lace articles; handkerchiefs, napkins, wearing apparel, and other articles, made wholly or in part of lace, or in imitation of lace; nets or nettings, veils and veilings, etamines, vitrages, neck ruffings, ruchings, tuckings, flutings, and quillings; embroideries and all trimmings, including braids, edgings, insertings, flouncings, galloons, gorings, and bands; wearing apparel, handkerchiefs, and other articles or fabrics embroidered in any manner by hand or machinery, whether with a letter, monogram, or otherwise; tamboured or appliquéd articles, fabrics, or wearing apparel; hemstitched or tucked flouncings or skirtings, and articles made wholly or in part of ruffings, tuckings, or ruchings; all of the foregoing, composed wholly or in chief value of flax, cotton, or other vegetable fiber, and not elsewhere specially provided for in this act, whether composed in part of India rubber or otherwise, sixty per centum ad valorem; *Provided*, That no wearing apparel or other article or textile fabric, when embroidered by hand or machinery, shall pay duty at a less rate than that imposed in any schedule of this act upon any embroideries of the materials of which such embroidery is composed.

340. Lace window curtains, pillow shams, and bed sets, finished or unfinished, made on the Nottingham lace-curtain machine or on the Nottingham warp machine, and composed of cotton or other vegetable fiber, when counting five points or spaces between the warp threads to the inch, one cent per square yard; when counting

more than five such points or spaces to the inch, one half of one cent per square yard in addition for each such point or space to the inch in excess of five; and in addition thereto, on all the foregoing articles in this paragraph, twenty per centum ad valorem; *Provided*, That none of the above-named articles shall pay a less rate of duty than fifty per centum ad valorem.

341. Plain woven fabrics of single jute yarns, by whatever name known, not exceeding sixty inches in width, weighing not less than six ounces per square yard and not exceeding thirty threads to the square inch, counting the warp and filling, five eighths of one cent per pound and fifteen per centum ad valorem; if exceeding thirty and not exceeding fifty-five threads to the square inch, counting the warp and filling, seven eighths of one cent per pound and fifteen per centum ad valorem.

342. All pile fabrics of which flax is the component material of chief value, sixty per centum ad valorem.

343. Bags or sacks made from plain woven fabrics, of single jute yarns, not dyed, colored, stained, painted, printed, or bleached, and not exceeding thirty threads to the square inch, counting the warp and filling, seven eighths of one cent per pound and fifteen per centum ad valorem.

344. Bagging for cotton, gunny cloth, and similar fabrics, suitable for covering cotton, composed of single yarns made of jute, jute butts, or hemp, not bleached, dyed, colored, stained, painted, or printed, not exceeding sixteen threads to the square inch, counting the warp and filling, and weighing not less than fifteen ounces per square yard, six tenths of one cent per square yard.

345. Handkerchiefs composed of flax, hemp, or ramie, or of which these substances, or either of them, is the component material of chief value, whether in the piece or otherwise, and whether finished or unfinished, not hemmed or hemmed only, fifty per centum ad valorem; if hemstitched, or imitation hemstitched, or reversed, or with drawn threads, but not embroidered or initialed, fifty-five per centum ad valorem.

346. Woven fabrics or articles not specially provided for in this act, composed of flax, hemp, or ramie, or of which these substances or either of them is the component material of chief value, weighing four and one half ounces or more per square yard, when containing not more than sixty threads to the square inch, counting the warp and filling, one and three-fourths cent per square yard; containing more than sixty and not more than one hundred and twenty threads to the square inch, two and three-fourths cents per square yard; containing more than one hundred and twenty and not more than one hundred and eighty threads to the square inch, six cents per square yard; containing more than one hundred and eighty threads to the square inch, nine cents per square yard, and in addition thereto, on all the foregoing, thirty per centum ad valorem; *Provided*, That none of the foregoing articles in this paragraph shall pay a less rate of duty than fifty per centum ad valorem. Woven fabrics of flax, hemp, or ramie, or of which these substances or either of them is the component material of chief value, including such as is known as shirting cloth, weighing less than four and one half ounces per square yard and containing more than one hundred threads to the square inch, counting the warp and filling, thirty-five per centum ad valorem.

347. All manufactures of flax, hemp, ramie, or other vegetable fiber, or of which these substances, or either of them, is the component material of chief value, not specially provided for in this act, forty-five per centum ad valorem.

SCHEDULE K.—WOOL AND MANUFACTURES OF WOOL.

348. All wools, hair of the camel, goat, alpaca, and other like animals, shall be divided, for the purpose of fixing the duties to be charged thereon, into the three following classes:

349. Class one, that is to say, merino, mestiza, metz, or metis wools, or other wools of Merino blood, immediate or remote, Down clothing wools, and wools of like character with any of the preceding, including Bagdad wool, China lamb's wool, Castel Branco, Adrianople skin wool or butcher's wool, and such as have been heretofore usually imported into the United States from Buenos Ayres, New Zealand, Australia, Cape of Good Hope, Russia, Great Britain, Canada, Egypt, Morocco, and elsewhere, and all wools not hereinafter included in classes two and three.

350. Class two, that is to say, Leicester, Cotswold, Lin-

colnshire, Down combing wools, Canada long wools, or other like combing wools of English blood, and usually known by the terms herein used, and also hair of the camel, Angora goat, alpaca, and other like animals.

351. Class three, that is to say, Donkoi, native South American, Cordova, Valparaiso, native Smyrna, Russian camel's hair, and all such wools of like character as have been heretofore usually imported into the United States from Turkey, Greece, Syria, and elsewhere, excepting improved wools hereinafter provided for.

352. The standard samples of all wools which are now or may be hereafter deposited in the principal customhouses of the United States, under the authority of the Secretary of the Treasury, shall be the standards for the classification of wools under this act, and the Secretary of the Treasury is authorized to renew these standards and to make such additions to them from time to time as may be required, and he shall cause to be deposited like standards in other customhouses of the United States when they may be needed.

353. Whenever wools of class three shall have been improved by the admixture of Merino or English blood, from their present character as represented by the standard samples now or hereafter to be deposited in the principal customhouses of the United States, such improved wools shall be classified for duty either as class one or as class two, as the case may be.

354. The duty on wools of the first class which shall be imported washed shall be twice the amount of the duty to which they would be subjected if imported unwashed; and the duty on wools of the first and second classes which shall be imported scoured shall be three times the duty to which they would be subjected if imported unwashed. The duty on wools of the third class, if imported in condition for use in carding or spinning into yarns, or which shall not contain more than eight per cent of dirt or other foreign substance, shall be three times the duty to which they would otherwise be subjected.

355. Unwashed wools shall be considered such as shall have been shorn from the sheep without any cleansing; that is, in their natural condition. Washed wools shall be considered such as have been washed with water only on the sheep's back, or on the skin. Wools of the first and second classes washed in any other manner than on the sheep's back or on the skin shall be considered as scoured wool.

356. The duty upon wool of the sheep or hair of the camel, Angora goat, alpaca, and other like animals, of class one and class two, which shall be imported in any other than ordinary condition, or which has been sorted or increased in value by the rejection of any part of the original fleece, shall be twice the duty to which it would be otherwise subject: *Provided*, That skirted wools as imported in eighteen hundred and ninety and prior thereto are hereby excepted. The duty upon wool of the sheep or hair of the camel, Angora goat, alpaca, and other like animals of any class which shall be changed in its character or condition for the purpose of evading the duty, or which shall be reduced in value by the admixture of dirt or any other foreign substance, shall be twice the duty to which it would be otherwise subject. When the duty assessed upon any wool equals three times or more that which would be assessed if said wool was imported unwashed, the duty shall not be doubled on account of the wool being sorted. If any bale or package of wool or hair specified in this act invoiced or entered as of any specified class, or claimed by the importer to be dutiable as of any specified class, shall contain any wool or hair subject to a higher rate of duty than the class so specified, the whole bale or package shall be subject to the highest rate of duty chargeable on wool of the class subject to such higher rate of duty, and if any bale or package be claimed by the importer to be shoddy, mungo, flecks, wool, hair, or other material of any class specified in this act, and such bale contain any admixture of any one or more of said materials, or of any other material, the whole bale or package shall be subject to duty at the highest rate imposed upon any article in said bale or package.

357. The duty upon all wools and hair of the first class shall be eleven cents per pound, and upon all wools or hair of the second class twelve cents per pound.

358. On wools of the third class and on camel's hair of the third class the value whereof shall be twelve cents or less per pound, the duty shall be four cents per pound.

359. On wools of the third class, and on camel's hair of

the third class, the value whereof shall exceed twelve cents per pound, the duty shall be seven cents per pound.

360. The duty on wools of the third class shall be one cent less per pound than is imposed on the same class on other wools of the same class and condition, the quantity and value to be ascertained under such rules as the Secretary of the Treasury may prescribe.

361. Top waste, slubbing waste, drawing waste, ring waste, and garnetted waste, thirty cents per pound.

362. Shoddy, twenty-five cents per pound; bone wool extract, yarn waste, thread waste, and all other wastes composed wholly or in part of wool, and not specially provided for in this act, twenty cents per pound.

363. Woolen rags, mungo, and flecks, ten cents per pound.

364. Wool and hair which have been advanced in any manner or by any process of manufacture beyond the washed or scoured condition, not specially provided for in this act, shall be subject to the same duties as are imposed upon manufactures of wool not specially provided for in this act.

365. On yarns made wholly or in part of wool, valued at not more than thirty cents per pound, the duty per pound shall be two and one half times the duty imposed by this act on one pound of unwashed wool of the first class; valued at more than thirty cents per pound, the duty per pound shall be three and one half times the duty imposed by this act on one pound of unwashed wool of the first class, and in addition thereto, upon all the foregoing, forty per centum ad valorem.

366. On cloths, knit fabrics, and all manufactures of every description made wholly or in part of wool, not specially provided for in this act, valued at not more than forty cents per pound, the duty per pound shall be three times the duty imposed by this act on a pound of unwashed wool of the first class; valued at above forty cents per pound and not above seventy cents per pound, the duty per pound shall be four times the duty imposed by this act on one pound of unwashed wool of the first class, and in addition thereto, upon all the foregoing, fifty per centum ad valorem; valued at over seventy cents per pound, the duty per pound shall be four times the duty imposed by this act on one pound of unwashed wool of the first class and fifty-five per centum ad valorem.

367. On blankets, and flannels for underwear composed wholly or in part of wool, valued at not more than forty cents per pound, the duty per pound shall be the same as the duty imposed by this act on two pounds of unwashed wool of the first class, and in addition thereto thirty per centum ad valorem; valued at more than forty cents and not more than fifty cents per pound, the duty per pound shall be three times the duty imposed by this act on one pound of unwashed wool of the first class, and in addition thereto thirty-five per centum ad valorem. On blankets composed wholly or in part of wool, valued at more than fifty cents per pound, the duty per pound shall be three times the duty imposed by this act on one pound of unwashed wool of the first class, and in addition thereto forty per centum ad valorem. Flannels composed wholly or in part of wool, valued at above fifty cents per pound, shall be classified and pay the same duty as women's and children's dress goods, coat linings, Italian cloths, and goods of similar character and description provided by this act: *Provided*, That on blankets over three yards in length the same duties shall be paid as on cloths.

368. On women's and children's dress goods, coat linings, Italian cloths, and goods of similar description and character of which the warp consists wholly of cotton or other vegetable material with the remainder of the fabric composed wholly or in part of wool, valued at not exceeding fifteen cents per square yard, the duty shall be seven cents per square yard; valued at more than fifteen cents per square yard, the duty shall be eight cents per square yard; and in addition thereto on all the foregoing valued at not above seventy cents per pound, fifty per centum ad valorem; valued above seventy cents per pound, fifty-five per centum ad valorem: *Provided*, That on all the foregoing, weighing over four ounces per square yard, the duty shall be the same as in respect of the schedule on cloths.

369. On women's and children's dress goods, coat linings, Italian cloths, bunting, and goods of similar description or character composed wholly or in part of wool, and not specially provided for in this act, the duty

shall be eleven cents per square yard; and in addition thereto on all the foregoing valued at not above seventy cents per pound, fifty per centum ad valorem; valued above seventy cents per pound, fifty-five per centum ad valorem: *Provided*, That on all the foregoing, weighing over four ounces per square yard, the duty shall be the same as imposed by this schedule on cloths.

370. On clothing, ready-made, and articles of wearing apparel of every description, including shawls whether knitted or woven, and knitted articles of every description, made up or manufactured wholly or in part, felts not woven and not specially provided for in this act, composed wholly or in part of wool, the duty per pound shall be four times the duty imposed by this act on one pound of unwashed wool of the first class, and in addition thereto sixty per centum ad valorem.

371. Webbing, gorges, suspenders, braces, bandings, beltings, bindings, braids, galloons, edgings, insertings, flourishes, fringes, gimpes, cords, cords and tassels, laces and other trimmings and articles made wholly or in part of lace embroideries and articles embroidered by hand or machinery, head nets, netting, buttons or barrel buttons or buttons of other forms for tassels or ornaments, and manufactures of wool ornamented with beads or spangles of whatever material composed, any of the foregoing made of wool or of which wool is a component material, whether composed in part of India rubber or otherwise, fifty cents per pound and sixty per centum ad valorem.

372. Aubusson, Axminster, moquette, and chenille carpets, figured or plain, and all carpets or carpeting of like character or description, sixty cents per square yard, and in addition thereto forty per centum ad valorem.

373. Saxony, Wilton, and Tournay velvet carpets, figured or plain, and all carpets or carpeting of like character or description, sixty cents per square yard, and in addition thereto forty per centum ad valorem.

374. Brussels carpets, figured or plain, and all carpets or carpeting of like character or description, forty-four cents per square yard, and in addition thereto forty per centum ad valorem.

375. Velvet and tapestry velvet carpets, figured or plain, printed on the warp or otherwise, and all carpets or carpeting of like character or description, forty cents per square yard, and in addition thereto forty per centum ad valorem.

376. Tapestry Brussels carpets, figured or plain, and all carpets or carpeting of like character or description, printed on the warp or otherwise, twenty-eight cents per square yard, and in addition thereto forty per centum ad valorem.

377. Treble ingrain, three-ply, and all chain Venetian carpets, twenty two cents per square yard, and in addition thereto forty per centum ad valorem.

378. Wool Dutch and two-ply ingrain carpets, eighteen cents per square yard, and in addition thereto forty per centum ad valorem.

379. Carpets of every description woven whole for rooms, and Oriental, Berlin, Aubusson, Axminster, and similar rugs, ten cents per square foot, and in addition thereto forty per centum ad valorem.

380. Druggets and bookings, printed, colored, or otherwise, twenty two cents per square yard, and in addition thereto forty per centum ad valorem.

381. Carpets and carpeting of wool, flax, or cotton, or composed in part of either, not specially provided for in this act, fifty per centum ad valorem.

382. Mats, rugs for floors, screens, covers, hassocks, bed spreaders, quilts, and other portions of carpets or carpeting made wholly or in part of wool, and not specially provided for in this act, shall be subjected to the rate of duty herein imposed on carpets or carpetings of like character or description.

383. Whenever in any schedule of this act, the word "wool" is used in connection with a manufactured article of which it is a component material, it shall be held to include wool or hair of the sheep, camel, goat, alpaca, or other animal, whether manufactured by the woolen, worsted, felt, or any other process.

SCHEDULE L. SILKS AND SILK GOODS.

384. Silk partially manufactured from cocoons or from waste silk, and not further advanced or manufactured than carded or combed silk, forty cents per pound.

385. Thrown silk, not more advanced than singles, tram, organzine, sewing silk, twist, floss, and silk threads or yarns of every description, except spun silk, thirty per centum ad valorem; spun silk in skeins, cops, warps, or

on beams, valued at not exceeding one dollar per pound, twenty cents per pound and fifteen per centum ad valorem; valued at over one dollar per pound and not exceeding one dollar and fifty cents per pound, thirty cents per pound and fifteen per centum ad valorem; valued at over one dollar and fifty cents per pound and not exceeding two dollars per pound, forty cents per pound and fifteen per centum ad valorem; valued at over two dollars per pound and not exceeding two dollars and fifty cents per pound, fifty cents per pound and fifteen per centum ad valorem; valued at over two dollars and fifty cents per pound, sixty cents per pound and fifteen per centum ad valorem; but in no case shall the foregoing articles pay a less rate of duty than thirty-five per centum ad valorem.

386. Velvets, velvet or plush ribbons, chenilles, or other pile fabrics, cut or uncut, composed of silk, or of which silk is the component material of chief value, not specially provided for in this act, one dollar and fifty cents per pound and fifteen per centum ad valorem; plushes, composed of silk, or of which silk is the component material of chief value, one dollar per pound and fifteen per centum ad valorem; but in no case shall the foregoing articles pay a less rate of duty than fifty per centum ad valorem.

387. Woven fabrics in the piece, not specially provided for in this act, weighing not less than one and one third ounce per square yard and not more than eight ounces per square yard, and containing not more than twenty per centum in weight of silk, if in the gum, fifty cents per pound, and if dyed in the piece, sixty cents per pound; if containing more than twenty per centum and not more than thirty per centum in weight of silk, if in the gum, sixty-five cents per pound, and if dyed in the piece, eighty cents per pound; if containing more than thirty per centum and not more than forty-five per centum in weight of silk, if in the gum, ninety cents per pound, and if dyed in the piece, one dollar and ten cents per pound; if dyed in the thread or yarn and containing not more than thirty per centum in weight of silk, if black (except selvages), seventy-five cents per pound, and if other than black, ninety cents per pound; if containing more than thirty and not more than forty-five per centum in weight of silk, if black (except selvages), one dollar and ten cents per pound, and if other than black, one dollar and thirty cents per pound; if containing more than forty-five per centum in weight of silk, or if composed wholly of silk, if dyed in the thread or yarn and weighted in the dyeing so as to exceed the original weight of the raw silk, if black (except selvages), one dollar and fifty cents per pound, and if other than black, two dollars and twenty-five cents per pound; if dyed in the thread or yarn, and the weight is not increased by dyeing beyond the original weight of the raw silk, three dollars per pound; if in the gum, two dollars and fifty cents per pound; if boiled off, or dyed in the piece, or printed, three dollars per pound; if weighing less than one and one third ounce and more than one third of an ounce per square yard, if in the gum, or if dyed in the thread or yarn, two and one half dollars per pound; if weighing less than one and one third ounce and more than one third of an ounce per square yard, if boiled off, three dollars per pound; if dyed or printed in the piece, three dollars and twenty-five cents per pound; if weighing not more than one third of an ounce per square yard, four dollars and fifty cents per pound; but in no case shall any of the foregoing fabrics in this paragraph pay a less rate of duty than fifty per centum ad valorem.

388. Handkerchiefs or mufflers composed wholly or in part of silk, whether in the piece or otherwise, finished or unfinished, if not hemmed or hemmed only, shall pay the same rate of duty as is imposed on goods in the piece of the same description, weight, and condition as provided for in this schedule; but such handkerchiefs or mufflers shall not pay a less rate of duty than fifty per centum ad valorem; if such handkerchiefs or mufflers are hemstitched or imitation hemstitched, or revered or have drawn threads, or are embroidered in any manner, whether with an initial letter, monogram, or otherwise, by hand or machinery, or are tumbled, appliquéed, or are made or trimmed wholly or in part with lace, or with tucking or insertion, they shall pay a duty of ten per centum ad valorem in addition to the duty hereinbefore prescribed, and in no case less than sixty per centum ad valorem.

389. Bandings, including hat bands, beltings, bindings, bone casings, braces, cords, cords and tassels, garters,

gorings, suspenders, tubings, and webs and webbings, composed wholly or in part of silk, and whether composed in part of India rubber or otherwise, if not embroidered in any manner by hand or machinery, fifty per centum ad valorem.

390. Laces, and articles made wholly or in part of lace, edgings, insertings, galloons, chiffon or other flourishes, nets or nettings and veilings, neck ruffings, ruffings, braids, fringes, trimmings, embroideries and articles embroidered by hand or machinery, or tansoured or appliqued, clothing ready-made, and articles of wearing apparel of every description, including knit goods, made up or manufactured in whole or in part by the tailor, seamstress, or manufacturer; all of the above-named articles made of silk, or of which silk is the component material of chief value, not specially provided for in this act, and silk goods ornamented with beads or spangles, of whatever material composed, sixty per centum ad valorem; *Provided*, That any wearing apparel or other articles provided for in this paragraph (except gloves) when composed in part of India rubber, shall be subject to a duty of sixty per centum ad valorem.

391. All manufactures of silk, or of which silk is the component material of chief value, including such as have India rubber as a component material, not specially provided for in this act, and all Jacquard figured goods in the piece, made on looms, of which silk is the component material of chief value, dyed in the yarn, and containing two or more colors in the filling, fifty per centum ad valorem; *Provided*, That all manufactures, of which wool is a component material, shall be classified and assessed for duty as manufactures of wool.

392. In ascertaining the weight of silk under the provisions of this schedule, the weight shall be taken in the condition in which found in the goods, without deduction therefrom for any dye, coloring matter, or other foreign substance or material.

SCHEDULE M.—PULP, PAPERS, AND BOOKS.

Pulp and Paper.—393. Mechanically ground wood pulp, one twelfth of one cent per pound, dry weight; chemical wood pulp, unbleached, one sixth of one cent per pound, dry weight; bleached, one fourth of one cent per pound, dry weight; *Provided*, That if any country or dependency shall impose an export duty on pulp wood exported to the United States, the amount of such export duty shall be added, as an additional duty, to the duties herein imposed upon wood pulp, when imported from such country or dependency.

394. Sheathing paper and roofing felt, ten per centum ad valorem.

395. Filter masee or filter stock, composed wholly or in part of wood pulp, wood flour, cotton or other vegetable fiber, one and one half cent per pound and fifteen per centum ad valorem.

396. Printing paper, unsized, sized, or glued, suitable for books and newspapers, valued at not above two cents per pound, three tenths of one cent per pound; valued above two cents and not above two and one half cents per pound, four tenths of one cent per pound; valued above two and one half cents per pound and not above three cents per pound, five tenths of one cent per pound; valued above three cents and not above four cents per pound, six tenths of one cent per pound; valued above four cents and not above five cents per pound, eight tenths of one cent per pound; valued above five cents per pound, fifteen per centum ad valorem; *Provided*, That if any country or dependency shall impose an export duty upon pulp wood exported to the United States, there shall be imposed upon printing paper when imported from such country or dependency an additional duty of one tenth of one cent per pound for each dollar of export duty per cord so imposed, and proportionately for fractions of a dollar of such export duty.

397. Papers commonly known as copying paper, stereotype paper, paper known as bibulous paper, tissue paper, pottery paper, and all similar papers, white, colored, or printed, weighing not over six pounds to the ream of four hundred and eighty sheets, on a basis of twenty by thirty inches, and whether in reams or any other form, six cents per pound and fifteen per centum ad valorem; if weighing over six pounds and not over ten pounds to the ream, and letter copying books, whether wholly or partly manufactured, five cents per pound and fifteen per centum ad valorem; crepe paper and filtering paper, five cents per pound and fifteen per centum ad valorem.

398. Surface-coated papers not specially provided for

in this act, two and one half cents per pound and fifteen per centum ad valorem; if printed, in whole or partly covered with metal or its substance, or with gold leaf or flock, three cents per pound and twenty per centum ad valorem; parchment papers, two cents per pound and ten per centum ad valorem; plain or photographic papers for albumenizing, sensitizing, or otherwise coating, three cents per pound and ten per centum ad valorem; albumenized or sensitized paper of paper otherwise surface-coated for photographic purposes, thirty per centum ad valorem.

Manufactures of Paper.—399. Paper envelopes, plain, twenty per centum ad valorem; if bordered, embossed, printed, tinted, or decorated, thirty-five per centum ad valorem.

400. Lithographic prints from stone, zinc, aluminum, or other material, bound or unbound, except cigar labels, flaps, and bands, lettered, or otherwise, maps, and illustrations when forming a part of a periodical or newspaper and accompanying the same, or if bound in or forming a part of printed books, not specially provided for in this act, on paper or other material not exceeding eight one thousandths of one inch in thickness, twenty cents per pound; on paper or other material exceeding eight one thousandths of one inch and not exceeding twenty one thousandths of one inch in thickness, and exceeding thirty-five square inches, but not exceeding four hundred square inches cutting size in dimensions, eight cents per pound; exceeding four hundred square inches cutting size in dimensions, thirty-five per centum ad valorem; prints exceeding eight one thousandths of one inch and not exceeding twenty one thousandths of one inch in thickness, and not exceeding thirty-five square inches cutting size in dimensions, five cents per pound; lithographic prints from stone, zinc, aluminum, or other material, on cardboard or other material, exceeding twenty one thousandths of one inch in thickness, six cents per pound; lithographic cigar labels, flaps, and bands, lettered or blank, printed from stone, zinc, aluminum, or other material, if printed in less than eight colors, brown printing to be counted as two colors, but not including labels, flaps, and bands printed in whole or in part in metal leaf, twenty cents per pound. Labels, flaps, and bands, if printed entirely in bronze printing, fifteen cents per pound; labels, flaps, and bands printed in eight or more colors, but not including labels, flaps, and bands printed in whole or in part in metal leaf, thirty cents per pound; labels, flaps, and bands printed in whole or in part in metal leaf, fifty cents per pound. Books of paper or other material for children's use, containing illuminated lithographic prints, not exceeding in weight twenty-four ounces each, and all booklets and fashion magazines or periodicals printed in whole or in part by lithographic process or decorated by hand, eight cents per pound.

401. Writing, letter, note, hand-made, drawing, ledger, bond, record, tablet, and typewriter paper, weighing not less than ten pounds and not more than fifteen pounds to the ream, two cents per pound and ten per centum ad valorem; weighing more than fifteen pounds to the ream, three and one half cents per pound and fifteen per centum ad valorem; but if any such paper is ruled, bordered, embossed, printed, or decorated in any manner, it shall pay ten per centum ad valorem in addition to the foregoing rates; *Provided*, That in computing the duty on such paper every one hundred and eighty thousand square inches shall be taken to be a ream.

402. Paper hangings and paper for screens or fireboards, and all other paper not specially provided for in this act, twenty-five per centum ad valorem; all Jacquard designs of one line paper, or parts of such designs, finished or unfinished, thirty-five per centum ad valorem; all Jacquard designs cut on Jacquard cards, or parts of such designs, finished or unfinished, thirty-five per centum ad valorem.

Manufactures of Paper.—403. Books of all kinds, including blank books and pamphlets, and engravings bound or unbound, photographs, etchings, maps, charts, music in books or sheets, and printed matter, all the foregoing not specially provided for in this act, twenty-five per centum ad valorem.

404. Photograph, autograph, and scrap album, all wholly or partly manufactured, thirty-five per centum ad valorem.

405. All fancy boxes made of paper, or of which paper is the component material of chief value, and whether surface-coated paper, forty-five per centum ad valorem.

406. Playing cards, in packs not exceeding fifty-four cards and at a like rate for any number in excess, ten cents per pack and twenty per centum ad valorem.

407. Manufactures of paper, or of which paper is the component material of chief value, not specially provided for in this act, thirty-five per centum ad valorem.

SCHEDULE N.—SUNDRIES.

408. Beads of all kinds, not threaded or strung, thirty-five per centum ad valorem; fabrics, nets or nettings, laces, embroideries, galloons, wearing apparel, ornaments, trimmings, and other articles not specially provided for in this act, composed wholly or in part of beads or spangles made of glass or paste, gelatin, metal, or other material, but not composed in part of wool, sixty per centum ad valorem.

409. Braids, plaits, laces, and willow sheets or squares, composed wholly of straw, chip, grass, palm leaf, willow, osier, or rattan, suitable for making or ornamenting hats, bonnets, or hoods, not bleached, dyed, colored, or stained, fifteen per centum ad valorem; if bleached, dyed, colored, or stained, twenty per centum ad valorem; hats, bonnets, and hoods, composed of straw, chip, grass, palm leaf, willow, osier, or rattan, whether wholly or partly manufactured, but not trimmed, thirty-five per centum ad valorem; if trimmed, fifty per centum ad valorem; but the terms "grass" and "straw" shall be understood to mean these substances in their natural form and structure, and not the separated fiber thereof.

410. Brushes, brooms, and feather dusters of all kinds, and hair pencils in quills or otherwise, forty per centum ad valorem.

411. Bristles, sorted, bunched, or prepared, seven and one half cents per pound.

Buttons and Button Forms.—412. Trousers buckles made wholly or partly of iron or steel, or parts thereof, valued at not more than fifteen cents per hundred, five cents per hundred; valued at more than fifteen cents per hundred and not more than fifty cents per hundred, ten cents per hundred; valued at more than fifty cents per hundred, fifteen cents per hundred; and in addition thereto on each and all of the above buckles or parts of buckles, fifteen per centum ad valorem.

413. Button forms: Lastings, mohair, cloth, silk, or other manufactures of cloth, woven or made in patterns of such size, shape, or form, or cut in such manner as to be fit for buttons exclusively, ten per centum ad valorem.

414. Buttons or parts of buttons and button molds or blanks, finished or unfinished, shall pay duty at the following rates, the line button measure being one fortieth of one inch, namely: Buttons known commercially as agate buttons, metal trousers buttons (except steel), and nickel bar buttons, one twelfth of one cent per line per gross; buttons of bone, and steel trousers buttons, one fourth of one cent per line per gross; buttons of pearl or shell, one and one half cent per line per gross; buttons of horn, vegetable, ivory, glass, or metal, not specially provided for in this act, three fourths of one cent per line per gross, and in addition thereto, on all the foregoing articles in this paragraph, fifteen per centum ad valorem; shoe buttons made of paper, board, *papier-maché*, pulp, or other similar material, not specially provided for in this act, valued at not exceeding three cents per gross, one cent per gross; buttons not specially provided for in this act, and all collar or cuff buttons and studs, fifty per centum ad valorem.

415. Coal, bituminous, and all coals containing less than ninety-two per centum of fixed carbon and shale, sixty-seven cents per ton of twenty-eight bushels, eighty pounds to the bushel; coal slack or culm, such as will pass through a half-inch screen, fifteen cents per ton of twenty-eight bushels, eighty pounds to the bushel: *Provided*, That on all coal imported into the United States, which is afterward used for fuel on board vessels propelled by steam and engaged in trade with foreign countries, or in trade between the Atlantic and Pacific ports of the United States, and which are registered under the laws of the United States, a drawback shall be allowed equal to the duty imposed by law upon such coal, and shall be paid under such regulations as the Secretary of the Treasury shall prescribe; coke, twenty per centum ad valorem.

416. Cork bark, cut into squares or cubes, eight cents per pound; manufactured corks over three fourths of an inch in diameter measured at larger end, fifteen cents per pound; three fourths of an inch and less in diameter,

measured at larger end, twenty-five cents per pound; cork, artificial, or cork substitutes, manufactured from cork waste and not otherwise provided for, eight cents per pound.

417. Dice, draughts, chessmen, chess balls, and billiard, pool, and bagatelle balls, of ivory, bone, or other materials, fifty per centum ad valorem.

418. Dolls, doll heads, toy marbles of whatever materials composed, and all other toys not composed of rubber, china, porcelain, parian, bisque, earthen, or stone ware, and not specially provided for in this act, thirty-five per centum ad valorem.

419. Emery grains, and emery manufactured, ground, pulverized, or refined, one cent per pound; emery wheels, emery files, and manufactures of which emery is the component material of chief value, twenty-five per centum ad valorem.

Explosive Substances.—420. Firecrackers of all kinds, eight cents per pound, the weight to include all coverings, wrappings, and packing material.

421. Fulminates, fulminating powders, and like articles, not specially provided for in this act, thirty per centum ad valorem.

422. Gunpowder, and all explosive substances used for mining, blasting, artillery, or sporting purposes, when valued at twenty cents or less per pound, four cents per pound; valued above twenty cents per pound, six cents per pound.

423. Matches, friction or lucifer, of all descriptions, per gross of one hundred and forty-four boxes, containing not more than one hundred matches per box, eight cents per gross; when imported otherwise than in boxes containing not more than one hundred matches each, one cent per one thousand matches.

424. Percussion caps, thirty-five per centum ad valorem; cartridges, thirty-five per centum ad valorem; blasting caps, two dollars and thirty-six cents per one thousand caps.

425. Feathers and downs of all kinds, including bird skins or parts thereof with the feathers on, crude or not dressed, colored, or otherwise advanced or manufactured in any manner, not specially provided for in this act, fifteen per centum ad valorem; when dressed, colored, or otherwise advanced or manufactured in any manner, including quilts of down and other manufactures of down, and also dressed and finished birds suitable for millinery ornaments, and artificial or ornamental feathers, fruits, grains, leaves, flowers, and stems or parts thereof, of whatever material composed, not specially provided for in this act, fifty per centum ad valorem.

426. Furs, dressed on the skin but not made up into articles, and furs not on the skin, prepared for hatters' use, including fur skins carroted, twenty per centum ad valorem.

427. Fans of all kinds, except common palm-leaf fans, fifty per centum ad valorem.

428. Gun wads of all descriptions, twenty per centum ad valorem.

429. Hair, human, if clean or drawn but not manufactured, twenty per centum ad valorem.

430. Hair, curled, suitable for beds or mattresses, ten per centum ad valorem.

431. Haircloth, known as "crinoline" cloth, ten cents per square yard; haircloth, known as "hair seating," and hair press cloth, twenty cents per square yard.

432. Hats, bonnets, or hoods, for men's, women's, boys', or children's wear, trimmed or untrimmed, including bodies, hoods, plateaux, forms, or shapes, for hats or bonnets, composed wholly or in chief value of fur of the rabbit, beaver, or other animals, valued at not more than five dollars per dozen, two dollars per dozen; valued at more than five dollars per dozen, and not more than ten dollars per dozen, three dollars per dozen; valued at more than ten dollars per dozen and not more than twenty dollars per dozen, five dollars per dozen; valued at more than twenty dollars per dozen, seven dollars per dozen; and in addition thereto on all the foregoing, twenty per centum ad valorem.

433. Indurated fiber ware and manufactures of wood or other pulp, and not otherwise specially provided for, thirty-five per centum ad valorem.

Jewelry and Precious Stones.—434. Articles commonly known as jewelry, and parts thereof, finished or unfinished, not specially provided for in this act, including precious stones set, pearls set or strung, and cameos in frames, sixty per centum ad valorem.

435. Diamonds and other precious stones advanced in

condition or value from their natural state by cleaving, splitting, cutting, or other process, and not set, ten per centum ad valorem; imitations of diamonds or other precious stones, composed of glass or paste, not exceeding an inch in dimensions, not engraved, painted, or otherwise ornamented or decorated, and not mounted or set, twenty per centum ad valorem.

436. Pearls in their natural state, not strung or set, ten per centum ad valorem.

Leather and Manufactures of.—437. Hides of cattle, raw or uncured, whether dry, salted, or pickled, fifteen per centum ad valorem; *Provided*, That upon all leather exported, made from imported hides, there shall be allowed a drawback equal to the amount of duty paid on such hides, to be paid under such regulations as the Secretary of the Treasury may prescribe.

438. Band or belting leather, sole leather, dressed upper and all other leather, calfskins tanned or tanned and dressed, kangaroo, sheep, and goat skins (including lamb and kid skins) dressed and finished, chamois and other skins, and bookbinders' calfskins, all the foregoing not specially provided for in this act, twenty per centum ad valorem; skins for morocco, tanned but unfinished, ten per centum ad valorem; patent, japanned, varnished, or enameled leather, weighing not over ten pounds per dozen hides or skins, thirty cents per pound and twenty per centum ad valorem; if weighing over ten pounds and not over twenty-five pounds per dozen, thirty cents per pound and ten per centum ad valorem; if weighing over twenty-five pounds per dozen, twenty cents per pound and ten per centum ad valorem; pianoforte leather and pianoforte action leather, thirty-five per centum ad valorem; leather shoe laces, finished or unfinished, fifty cents per gross pairs and twenty per centum ad valorem; boots and shoes made of leather, twenty-five per centum ad valorem; *Provided*, That leather cut into shoe uppers or vamps or other forms, suitable for conversion into manufactured articles, shall be classified as manufactures of leather and pay duty accordingly.

Gloves: 439. Gloves made wholly or in part of leather, whether wholly or partly manufactured, shall pay duty at the following rates, the lengths stated in each case being the extreme length when stretched to their full extent, namely:

440. Women's or children's "glace" finish, Schmaschen (of sheep origin), not over fourteen inches in length, one dollar and seventy-five cents per dozen pairs; over fourteen inches and not over seventeen inches in length, two dollars and twenty-five cents per dozen pairs; over seventeen inches in length, two dollars and seventy-five cents per dozen pairs; men's "glace" finish, Schmaschen (sheep), three dollars per dozen pairs.

441. Women's or children's "glace" finish, lamb or sheep, not over fourteen inches in length, two dollars and fifty cents per dozen pairs; over fourteen and not over seventeen inches in length, three dollars and fifty cents per dozen pairs; over seventeen inches in length, four dollars and fifty cents per dozen pairs; men's "glace" finish, lamb or sheep, four dollars per dozen pairs.

442. Women's or children's "glace" finish, goat, kid, or other leather than of sheep origin, not over fourteen inches in length, three dollars per dozen pairs; over fourteen and not over seventeen inches in length, three dollars and seventy-five cents per dozen pairs; over seventeen inches in length, four dollars and seventy-five cents per dozen pairs; men's "glace" finish, kid, goat, or other leather than of sheep origin, four dollars per dozen pairs.

443. Women's or children's, of sheep origin, with exterior grain surface removed, by whatever name known, not over seventeen inches in length, two dollars and fifty cents per dozen pairs; over seventeen inches in length, three dollars and fifty cents per dozen pairs; men's, of sheep origin, with exterior surface removed, by whatever name known, four dollars per dozen pairs.

444. Women's or children's kid, goat, or other leather than of sheep origin, with exterior grain surface removed, by whatever name known, not over fourteen inches in length, three dollars per dozen pairs; over fourteen inches and not over seventeen inches in length, three dollars and seventy-five cents per dozen pairs; over seventeen inches in length, four dollars and seventy-five cents per dozen pairs; men's, goat, kid, or other leather than of sheep origin, with exterior grain surface removed, by whatever name known, four dollars per dozen pairs.

445. In addition to the foregoing rates there shall be paid the following cumulative duties: On all leather gloves, when lined, one dollar per dozen pairs; on all piqué or piz seam gloves, forty cents per dozen pairs; on all gloves stitched or embroidered with more than three single strands of cords, forty cents per dozen pairs.

446. Glove trunks, with or without the usual accompanying pieces, shall pay seventy-five per centum of the duty provided for the gloves in the fastenings of which they are suitable.

447. Harness, saddles, and saddlery, or parts of either, in sets or in parts, finished or unfinished, forty-five per centum ad valorem.

Miscellaneous Manufactures.—448. Manufactures of amber, asbestos, bladders, cork, caigut, or whip gut, or worm gut, or wax, or of which these substances or either of them is the component material of chief value, not specially provided for in this act, twenty-five per centum ad valorem.

449. Manufactures of bone, chip, grass, horn, India rubber, palm leaf, straw, woods, or whalebone, or of which these substances or either of them is the component material of chief value, not specially provided for in this act, thirty per centum ad valorem; but the terms "grass" and "straw" shall be understood to mean those substances in their natural form and structure, and not the separated fiber thereof.

450. Manufactures of leather, finished or unfinished, manufactures of fur, gelatin, gutta serena, human hair, ivory, vegetable ivory, mother-of-pearl and shell, plaster of Paris, *papier-mâché*, and vulcanized India rubber known as "hard rubber," or of which these substances or either of them is the component material of chief value, not specially provided for in this act, and shells engraved, cut, ornamented, or otherwise manufactured, thirty-five per centum ad valorem.

451. Masks, composed of paper or pulp, thirty-five per centum ad valorem.

452. Matting made of cocoa fiber or rattan, six cents per square yard; mats made of cocoa fiber or rattan, four cents per square foot.

453. Musical instruments or parts thereof, pianoforte actions and parts thereof, strings for musical instruments, not otherwise enumerated, cases for musical instruments, pitch pipes, tuning forks, tuning hammers, and metronomes; strings for musical instruments, composed wholly or in part of steel or other metal, all the foregoing, forty-five per centum ad valorem.

454. Paintings in oil or water colors, pastels, pen-and-ink drawings, and statuary, not specially provided for in this act, twenty per centum ad valorem; but the term "statuary" as used in this act shall be understood to include only such statuary as is cut, carved, or otherwise wrought by hand from a solid block or mass of marble, stone, or alabaster, or from metal, and as is the professional production of a statuary or sculptor only.

455. Peat moss, one dollar per ton.

456. Pencils of paper or wood filled with lead or other material, and pencils of lead, forty-five cents per gross and twenty-five per centum ad valorem; slate pencils, covered with wood, thirty-five per centum ad valorem; all other slate pencils, three cents per one hundred.

457. Pencil leads not in wood, ten per centum ad valorem.

458. Photographic dry plates or films, twenty-five per centum ad valorem.

459. Pipes and smokers' articles: Common tobacco pipes and pipe bowls made wholly of clay, valued at not more than forty cents per gross, fifteen cents per gross; other tobacco pipes and pipe bowls of clay, fifty cents per gross and twenty-five per centum ad valorem; other pipes and pipe bowls of whatever material composed, and all smokers' articles whatsoever, not specially provided for in this act, including cigarette books, cigarette-book covers, pouches for smoking or chewing tobacco, and cigarette paper in all forms, sixty per centum ad valorem.

460. Plows, tooth and disk harrows, harvesters, reapers, agricultural drills, and planters, mowers, horse-rakes, cultivators, thrashing machines, and cotton gins, twenty per centum ad valorem.

461. Plush, black, known commercially as pattern plush, composed of silk, or of silk and cotton, or as used exclusively for making men's hats, ten per centum ad valorem.

462. Umbrellas, parasols, and sun shades, when with material other than paper, fifty per centum ad valorem.

Sticks for umbrellas, parasols, or sun shades, and walking canes, finished or unfinished, forty per centum ad valorem.

463. Waste, not specially provided for in this act, ten per centum ad valorem.

FREE LIST.

SEC. 2. That on and after the passage of this act, unless otherwise specially provided for in this act, the following articles when imported shall be exempt from duty:

464. Acids: Arsenic or arsenious, benzoic, carbolic, fluoric, hydrochloric or muriatic, nitric, oxalic, phosphoric, phthalic, picric or nitropicric, prussic, silicic, and valericianic.

465. Aconite.

466. Acorns, raw, dried or undried, but unground.

467. Agates, unmanufactured.

468. Albumen, not specially provided for.

469. Alizarin, natural or artificial, and dyes derived from alizarin or from anthracin.

470. Amber, and amberoid unmanufactured, or crude gum.

471. Ambergris.

472. Aniline salts.

473. Any animal imported specially for breeding purposes shall be admitted free: *Provided*, That no such animal shall be admitted free unless pure bred of a recognized breed, and duly registered in the book of record established for that breed: *And provided further*, That certificate of such record and of the pedigree of such animal shall be produced and submitted to the customs officer, duly authenticated by the proper custodian of such book of record, together with the affidavit of the owner, agent, or importer that such animal is the identical animal described in said certificate of record and pedigree: *And provided further*, That the Secretary of Agriculture shall determine and certify to the Secretary of the Treasury what are recognized breeds and pure-bred animals under the provisions of this paragraph. The Secretary of the Treasury may prescribe such additional regulations as may be required for the strict enforcement of this provision. Cattle, horses, sheep, or other domestic animals straying across the boundary line into any foreign country, or driven across such boundary line by the owner for temporary pasturage purposes only, together with their offspring, may be brought back to the United States within six months free of duty, under regulations to be prescribed by the Secretary of the Treasury.

474. Animals brought into the United States temporarily for a period not exceeding six months, for the purpose of exhibition or competition for prizes offered by any agricultural or racing association; but a bond shall be given in accordance with regulations prescribed by the Secretary of the Treasury; also teams of animals, including their harness and tackle and the wagons or other vehicles actually owned by persons emigrating from foreign countries to the United States with their families, and in actual use for the purpose of such emigration under such regulations as the Secretary of the Treasury may prescribe; and wild animals intended for exhibition in zoological collections for scientific and educational purposes, and not for sale or profit.

475. Annatto, roucou, rocou, or orleans, and all extracts of.

476. Antimony ore, crude sulphite of.

477. Apatite.

478. Arrowroot in its natural state and not manufactured.

479. Arsenic and sulphide of, or orpiment.

480. Arseniate of aniline.

481. Art educational stops, composed of glass and metal and valued at not more than six cents per gross.

482. Articles in a crude state used in dyeing or tanning not specially provided for in this act.

483. Articles the growth, produce, and manufacture of the United States, when returned after having been exported, without having been advanced in value or improved in condition by any process of manufacture or other means; casks, barrels, carboys, bags, and other vessels of American manufacture exported filled with American products, or exported empty and returned filled with foreign products, including shocks and staves when returned as barrels or boxes; also quicksilver flasks or bottles, of either domestic or foreign manufacture, which shall have been actually exported from the United States; but proof of the identity of such articles shall be

made, under general regulations to be prescribed by the Secretary of the Treasury, but the exemption of bags from duty shall apply only to such domestic bags as may be imported by the exporter thereof, and if any such articles are subject to internal tax at the time of exportation, such tax shall be proved to have been paid before exportation and not refunded: *Provided*, That this paragraph shall not apply to any article upon which an allowance of drawback has been made, the reimportation of which is hereby prohibited except upon payment of duties equal to the drawbacks allowed; or to any article manufactured in bonded warehouse and exported under any provision of law: *And provided further*, That when manufactured tobacco which has been exported without payment of internal-revenue tax shall be reimported it shall be retained in the custody of the collector of customs until internal-revenue stamps in payment of the legal duties shall be placed thereon.

484. Asbestos, unmanufactured.

485. Ashes, wood and lye of, and beet-root ashes.

486. Asafetida.

487. Balm of Gilead.

488. Barka, cinchona or other from which quinine may be extracted.

489. Baryta, carbonate of, or witherite.

490. Beeswax.

491. Binding twine: All binding twine manufactured from New Zealand hemp,istle or Tampico fiber, sisal grass, or sunn, or a mixture of any two or more of them, of single ply and measuring not exceeding six hundred feet to the pound: *Provided*, That articles mentioned in this paragraph if imported from a country which lays an import duty on like articles imported from the United States, shall be subject to a duty of one half of one cent per pound.

492. Bells, broken, and bell metal broken and fit only to be remanufactured.

493. Birds, stuffed, not suitable for millinery ornaments.

494. Birds and land and water fowls.

495. Bismuth.

496. Bladders, and all integuments and intestines of animals and fish sounds, crude, dried or salted for preservation only, and unmanufactured, not specially provided for in this act.

497. Blood, dried, not specially provided for.

498. Bolting cloths composed of silk, imported expressly for milling purposes, and so permanently marked as not to be available for any other use.

499. Bones, crude, or not burned, calcined, ground, steamed, or otherwise manufactured, and bone dust or animal carbon, and bone ash, fit only for fertilizing purposes.

500. Books, engravings, photographs, etchings, bound or unbound, maps and charts imported by authority or for the use of the United States or for the use of the Library of Congress.

501. Books, maps, music, engravings, photographs, etchings, bound or unbound, and charts which shall have been printed more than twenty years at the date of importation, and all hydrographic charts, and publications issued for their subscribers or exchanges by scientific and literary associations or academies, or publications of individuals for gratuitous private circulation, and public documents issued by foreign governments.

502. Books and pamphlets printed exclusively in languages other than English; also books and music, in raised print, used exclusively by the blind.

503. Books, maps, music, photographs, etchings, lithographic prints, and charts, specially imported, not more than two copies in any one invoice, in good faith, for the use or by order of any society or institution incorporated or established solely for religious, philosophical, educational, scientific, or literary purposes, or for the encouragement of the fine arts, or for the use or by order of any college, academy, school, or seminary of learning in the United States, or any State or public library, and not for sale, subject to such regulations as the Secretary of the Treasury shall prescribe.

504. Books, libraries, usual and reasonable furniture, and similar household effects of persons or families from foreign countries, all the foregoing if actually used abroad by them not less than one year, and not intended for any other person or persons, nor for sale.

505. Brass, old brass, clippings from brass or Dutch metal, all the foregoing, fit only for remanufacture.

506. Brazil paste.

507. Brazilian pebble, unwrought or unmanufactured.
 508. Breccia, in block or slabs.
 509. Bristles, crude, not sorted, bunched, or prepared.
 510. Broom corn.
 511. Bullion, gold or silver.
 512. Burgundy pitch.
 513. Cadmium.
 514. Calamine.
 515. Camphor, crude.
 516. Castor or castoreum.
 517. Catgut, whip gut, or worm gut, unmanufactured.
 518. Cerium.
 519. Chalk, crude, not ground, precipitated, or otherwise manufactured.
 520. Chromate of iron or chromic ore.
 521. Clivet, crude.
 522. Clay: Common blue clay in casks suitable for the manufacture of crucibles.
 523. Coal, anthracite, not specially provided for in this act, and coal stores of American vessels, but none shall be unloaded.
 524. Coal tar, crude, pitch of coal tar, and products of coal tar known as dead or creosote oil, benzol, toluol, naphthalin, xylol, phenol, cresol, toluidine, xylidin, cumidin, binitrotoluol, binitrobenzol, benzidin, tolidin, dianidin, naphthol, naphthylamin, diphenylamin, benzaldehyde, benzyl chloride, resorcin, nitro-benzol, and nitro-toluol; all the foregoing not medicinal and not colors or dyes.
 525. Cobalt and cobalt ore.
 526. Cocculus indicus.
 527. Cocchineal.
 528. Cocoa, or cacao, crude, and fiber, leaves, and shells of.
 529. Coffee.
 530. Coins, gold, silver, and copper.
 531. Coir and coir yarn.
 532. Copper in plates, bars, ingots, or pigs, and other forms, not manufactured or specially provided for in this act.
 533. Old copper, fit only for manufacture, clipping from new copper, and all composition metal of which copper is a component material of chief value not specially provided for in this act.
 534. Copper, regulus of, and black or coarse copper, and copper cement.
 535. Coral, marine, uncut, and unmanufactured.
 536. Cork wood, or cork bark, unmanufactured.
 537. Cotton, and cotton waste or flocks.
 538. Cryolite or kryolith.
 539. Cudbear.
 540. Curling stones, or quoits, and curling-stone handles.
 541. Curry and curry powder.
 542. Cutch.
 543. Cuttlefish bone.
 544. Dandelion roots, raw, dried, or undried, but unground.
 545. Diamonds and other precious stones, rough or uncut, and not advanced in condition or value from their natural state by cleaving, splitting, cutting, or other process, including miners', glaziers', and engravers' diamonds not set, and diamond dust or bort.
 546. Divi-divi.
 547. Dragon's blood.
 548. Drugs, such as barks, beans, berries, balsams, buds, bulbs, and bulbous roots, excrecences, fruits, flowers, dried fibers, and dried insects, grains, gums, and gum resin, herbs, leaves, lichens, mosses, nuts, nutgalls, roots, and stems, spices, vegetables, seeds aromatic, and seeds of morbid growth, weeds, and woods used expressly for dyeing; any of the foregoing which are drugs and not edible and are in a crude state and not advanced in value or condition by refining or grinding, or by other process, and not specially provided for in this act.
 549. Eggs of birds, fish, and insects: *Provided, however*, That this shall not be held to include the eggs of game birds or eggs of birds not used for food, the importation of which is prohibited except specimens for scientific collections, nor fish roe preserved for food purposes.
 550. Emery ore.
 551. Ergot.
 552. Fans, common palm-leaf, plain and not ornamented or decorated in any manner, and palm leaf in its natural state, not colored, dyed, or otherwise advanced or manufactured.
 553. Felt, adhesive, for sheathing vessels.
 554. Fibrin, in all forms.
 555. Fish, fresh, frozen, or packed in ice, caught in the Great Lakes or other fresh waters by citizens of the United States.
 556. Fish skins.
 557. Flint, flints, and flint stones, unground.
 558. Fossils.
 559. Fruits or berries, green, ripe, or dried, and fruits in brine, not specially provided for in this act.
 560. Fruit plants, tropical and semitropical, for the purpose of propagation and cultivation.
 561. Furs, undressed.
 562. Fur skins of all kinds not dressed in any manner and not specially provided for in this act.
 563. Gambier.
 564. Glass enamel, white, for watch and clock dials.
 565. Glass plates or disks, rough cut or unwrought, for use in the manufacture of optical instruments, spectacles, and eye glasses, and suitable for such use: *Provided, however*, That such disks exceeding eight inches in diameter may be polished sufficiently to enable the character of the glass to be determined.
 566. Grasses and fibers: Jute or Tampico fiber, jute, jute butts, manilla, sisal grass, esen, and all other textile grasses or fibrous vegetable substances, not dressed or manufactured in any manner, and not specially provided for in this act.
 567. Gold-beaters' molds and gold-beaters' skins.
 568. Grease, and oils (excepting fish oils, such as are commonly used in soap making or in wire drawing, or for stuffing or dressing leather, and which are fit only for such uses, and not specially provided for in this act).
 569. Guano, manures, and all substances used only for manure.
 570. Gutta-percha, crude.
 571. Hair of horses, cattle, and other animals, cleaned or uncleaned, drawn or undrawn, but unmanufactured, not specially provided for in this act; and human hair, raw, uncleaned, and not drawn.
 572. Hide cuttings, raw, with or without hair, and all other glue stock.
 573. Hide rope.
 574. Hones and whetstones.
 575. Hoofs, unmanufactured.
 576. Hop roots for cultivation.
 577. Horns and parts of, unmanufactured, including horn strips and tips.
 578. Ice.
 579. India rubber, crude, and milk of, and old scrap or refuse India rubber which has been worn out by use and is fit only for remanufacture.
 580. Indigo.
 581. Iodine, crude.
 582. Ipeac.
 583. Iridium.
 584. Ivory tusks in their natural state or cut vertically across the grain only, with the bark left intact, and vegetable ivory in its natural state.
 585. Jalap.
 586. Jet, unmanufactured.
 587. Jena dye, or Jena light.
 588. Junk, old.
 589. Kelp.
 590. Kieserite.
 591. Kyanite, or cyanite, and kainite.
 592. Lac dye, crude, seed, button, stick, and shell.
 593. Lac spirits.
 594. Lactarene.
 595. Lava, unmanufactured.
 596. Leeches.
 597. Lemon juice, lime juice, and sour orange juice.
 598. Licorice root, unground.
 599. Lifeboats and life-saving apparatus specially imported by societies incorporated or established to encourage the saving of human life.
 600. Lime, citrate of.
 601. Lithographic stones, not engraved.
 602. Litmus, prepared or not prepared.
 603. Limestones.
 604. Madder and munjeet, or Indian madder, ground or prepared, and all extracts of.
 605. Magnesite, crude or calcined, not polished.
 606. Magnesium, not made up into articles.
 607. Manganese, oxide and ore of.
 608. Manna.
 609. Manuscripts.
 610. Marrow, crude.

611. Marshmallow or althea root, leaves or flowers, natural or unmanufactured.

612. Medals of gold, silver, or copper, and other metallic articles actually bestowed as trophies or prizes, and received and accepted as honorary distinctions.

613. Meerschaum, crude or unmanufactured.

614. Minerals, crude, or not advanced in value or condition by refining or grinding, or by other process of manufacture, not specially provided for in this act.

615. Mineral salts obtained by evaporation from mineral waters, when accompanied by a duly authenticated certificate and satisfactory proof, showing that they are in no way artificially prepared, and are only the product of a designated mineral spring.

616. Models of inventions and of other improvements in the arts, including patterns for machinery, but no article shall be deemed a model or pattern which can be fitted for use otherwise.

617. Moss, seaweeds, and vegetable substances, crude or unmanufactured, not otherwise specially provided for in this act.

618. Musk, crude, in natural pods.

619. Myrobolans.

620. Needles, hand sewing and darning.

621. Newspapers and periodicals; but the term "periodicals" as herein used shall be understood to embrace only unbound or paper-covered publications, issued within six months of the time of entry, containing current literature of the day and issued regularly at stated periods, as weekly, monthly, or quarterly.

622. Nuts: Brazil nuts, cream nuts, palm nuts and palm-nut kernels; cocoanuts in the shell and broken cocoanut meat or copra, not shredded, desiccated, or prepared in any manner.

623. Nux vomica.

624. Oakum.

625. Oil cake.

626. Oils: Almond, amber, crude and rectified ambergris, anise or anise seed, aniline, aspic or spike lavender, bergamot, cajuput, caraway, cassia, cinnamon, cedrat, camomile, citronella or lemon grass, civet, cocoanut, fennel, jethyol, jasmine or jasmine, juglandium, juniper, lavender, lemon, limes, mace, neroli or orange flower, enfleurage grease, nut oil or oil of nuts not otherwise specially provided for in this act, orange oil, olive oil for manufacturing or mechanical purposes, fit only for such use and valued at not more than 60 cents per gallon, ottar of roses, palm, rosemary or anthonos, sesame or sesamum seed or bean, thyme, origanum red or white, valerian; and also spermaceti, whale, and other fish oils of American fisheries, and all fish and other products of such fisheries; petroleum, crude or refined: *Provided*, That if there be imported into the United States crude petroleum, or the products of crude petroleum produced in any country which imposes a duty on petroleum or its products exported from the United States, there shall in such cases be levied, paid, and collected a duty upon said crude petroleum or its products so imported equal to the duty imposed by such country.

627. Orange and lemon peel, not preserved, candied, or dried.

628. Orchil or orchil liquid.

629. Ores of gold, silver, copper, or nickel, and nickel matte: sweepings of gold and silver.

630. Osmium.

631. Palladium.

632. Paper stock, crude, of every description, including all grasses, fibers, rags (other than wool), waste, including jute waste, shavings, clippings, old paper, rope ends, waste rope, and waste bagging, including old gunny cloth and old gunny bags, fit only to be converted into paper.

633. Paraffin.

634. Parchment and vellum.

635. Pearl, mother of, and shells, not sawed, cut, polished, or otherwise manufactured, or advanced in value from the natural state.

636. Personal effects, not merchandise, of citizens of the United States dying in foreign countries.

637. Pewter and britannia metal, old, and fit only to be remanufactured.

638. Philosophical and scientific apparatus, utensils, instruments, and preparations, including bottles and boxes containing the same, specially imported in good faith for the use and by order of any society or institution incorporated or established solely for religious, philosophical, educational, scientific, or literary purposes, or for the encouragement of the fine arts, or for the use or

by order of any college, academy, school, or seminary of learning in the United States, or any State or public library, and not for sale, subject to such regulations as the Secretary of the Treasury shall prescribe.

639. Phosphates, crude.

640. Plants, trees, shrubs, roots, seed cane, and seeds, imported by the Department of Agriculture or the United States Botanic Garden.

641. Platina, in ingots, bars, sheets, and wire.

642. Platinum, unmanufactured, and vases, retorts, and other apparatus, vessels, and parts thereof composed of platinum, for chemical uses.

643. Plumbago.

644. Potash, crude, or "black salts"; carbonate of potash, crude or refined; hydrate of, or caustic potash, not including refined in sticks or rolls; nitrate of potash or saltpeter, crude; sulphate of potash, crude or refined, and muriate of potash.

645. Professional books, implements, instruments, and tools of trade, occupation, or employment, in the actual possession at the time, of persons emigrating to the United States; but this exemption shall not be construed to include machinery or other articles imported for use in any manufacturing establishment, or for any other person or persons, or for sale, nor shall it be construed to include theatrical scenery, properties, and apparel; but such articles brought by proprietors or managers of theatrical exhibitions arriving from abroad, for temporary use by them in such exhibitions, and not for any other person, and not for sale, and which have been used by them abroad, shall be admitted free of duty, under such regulations as the Secretary of the Treasury may prescribe; but bonds shall be given for the payment to the United States of such duties as may be imposed by law upon any and all such articles as shall not be exported within six months after such importation: *Provided*, That the Secretary of the Treasury may in his discretion extend such period for a further term of six months in case application shall be made therefor.

646. Pulu.

647. Quinia, sulphate of, and all alkaloids or salts of cinchona bark.

648. Rags, not otherwise specially provided for in this act.

649. Regalia and gems, statuary, and specimens or casts of sculpture, where specially imported in good faith for the use and by order of any society incorporated or established solely for religious, philosophical, educational, scientific, or literary purposes, or for the encouragement of the fine arts, or for the use and by order of any college, academy, school, or seminary of learning in the United States, or any State or public library, and not for sale; but the term "regalia" as herein used shall be held to embrace only such insignia of rank or office or emblems as may be worn upon the person or borne in the hand during public exercises of the society or institution, and shall not include articles of furniture or fixtures, or of regular wearing apparel, nor personal property of individuals.

650. Rennets, raw or prepared.

651. Saffron and safflower, and extract of, and saffron cake.

652. Sago, crude.

653. Salacin.

654. Salep, or salop.

655. Sausages, bologna.

656. Seeds: Anise, caraway, cardamom, cauliflower, coriander, cotton, cummin, fennel, fenugreek, hemp, hoarhound, mangel-wurzel, mustard, rape, Saint John's bread or bean, sugar beet, sorghum or sugar cane for seed; bulbs and bulbous roots, not edible and not otherwise provided for; all flower and grass seeds; all the foregoing not specially provided for in this act.

657. Sheep dip, not including compounds or preparations that can be used for other purposes.

658. Shotgun barrels, in single tubes, forged, rough bored.

659. Shrimps and other shellfish.

660. Silk, raw, or as reeled from the cocoon, but not doubled, twisted, or advanced in manufacture in any way.

661. Silk cocoons and silk waste.

662. Silkworms' eggs.

663. Skeletons and other preparations of anatomy.

664. Skins of all kinds, raw (except sheepskins with the wool on), and hides not specially provided for in this act.

665. Soda, nitrate of, or cubic nitrate.
666. Specimens of natural history, botany, and mineralogy, when imported for scientific public collections, and not for sale.
667. Spices: Cassia, cassia vera, and cassia buds; cinnamon and chips of; cloves and clove stems; mace; nutmegs; pepper, black or white, and pimento; all the foregoing when unground; ginger root, unground and not preserved or candied.
668. Spunk.
669. Spurs and stilts used in the manufacture of earthen, porcelain, and stone ware.
670. Stamps; foreign postage or revenue stamps, canceled or uncanceled.
671. Stone and sand: Burrstone in blocks, rough or unmanufactured; cliff stone, unmanufactured; rotten stone, tripoli, and sand, crude or manufactured, not otherwise provided for in this act.
672. Stronax, or styrax.
673. Strontia, oxide of, and protoxide of strontian, and strontianite, or mineral carbonate of strontia.
674. Sulphur, lac or precipitated, and sulphur or brimstone, crude, in bulk, sulphur ore as pyrites, or sulphuret of iron in its natural state, containing in excess of twenty-five per centum of sulphur, and sulphur not otherwise provided for.
675. Sulphuric acid which at the temperature of sixty degrees Fahrenheit does not exceed the specific gravity of one and three hundred and eighty thousandths, for use in manufacturing superphosphate of lime or artificial manures of any kind, or for any agricultural purposes: *Provided*, That upon all sulphuric acid imported from any country, whether independent or a dependency, which imposes a duty upon sulphuric acid imported into such country from the United States, there shall be levied and collected a duty of one fourth of one cent per pound.
676. Tamarinda.
677. Tapioca, cassava or cassady.
678. Tar and pitch of wood.
679. Tea and tea plants.
680. Teeth, natural, or unmanufactured.
681. Terra alba, not made from gypsum or plaster rock.
682. Terra japonica.
683. Tin ore, casiterite or black oxide of tin, and tin in bars, blocks, pigs, or grain or granulated.
684. Tobacco stems.
685. Tonquin, tonqua, or tonka beans.
686. Turmeric.
687. Turpentine, Venice.
688. Turpentine, spirits of.
689. Turtles.
690. Types, old, and fit only to be remanufactured.
691. Uranium, oxide and salts of.
692. Vaccine virus.
693. Valonia.
694. Verdigris, or subacetate of copper.
695. Wax, vegetable or mineral.
696. Wafers, unleavened or not edible.
697. Wearing apparel, articles of personal adornment, toilet articles, and similar personal effects of persons arriving in the United States; but this exemption shall only include such articles as actually accompany and are in the use of, and as are necessary and appropriate for the wear and use of such persons, for the immediate purposes of the journey and present comfort and convenience, and shall not be held to apply to merchandise or articles intended for other persons or for sale: *Provided*, That in case of residents of the United States returning from abroad, all wearing apparel and other personal effects taken by them out of the United States to foreign countries shall be admitted free of duty, without regard to their value, upon their identity being established, under appropriate rules and regulations to be prescribed by the Secretary of the Treasury, but no more than one hundred dollars in value of articles purchased abroad by such residents of the United States shall be admitted free of duty upon their return.
698. Whalebone, unmanufactured.
699. Wood: Logs and round unmanufactured timber, including pulp-woods, firewood, handle-bolts, shingle-bolts, gun-blocks for gun-blocks rough-hewn or sawed or planed on one side, hop-poles, ship-timber and ship-planking; all the foregoing not specially provided for in this act.
700. Woods: Cedar, lignum-vitæ, lancewood, ebony,

box, granadilla, mahogany, rose-wood, satinwood, and all forms of cabinet woods, in the rough or hewn only; briar root or briar wood and wood of any other unmanufactured, or not further advanced than cut into blocks suitable for the articles into which they are intended to be converted; bamboo, rattan, reeds, unmanufactured India malacca joints, and sticks of palm-wood; bent wood, pimento, orange, myrtle, and other woods not specially provided for in this act, in the rough or not further advanced than cut into lengths suitable for sticks for umbrellas, parasols, caneblades, whips, fishing-rods or walking-canes.

701. Works of art, drawings, engravings, photographs, or pictures, and philosophical and scientific apparatus brought by professional artists, lecturers, or scientists arriving from abroad for use by them temporarily for exhibition and in illustration, promotion, and encouragement of art, science, or industry in the United States, and not for sale, shall be admitted free of duty, under such regulations as the Secretary of the Treasury shall prescribe; but bonds shall be given for the payment to the United States of such duties as may be imposed by law upon any and all such articles as shall not be exported within six months after such importation: *Provided*, That the Secretary of the Treasury may, in his discretion, extend such period for a further term of six months in cases where applications therefor shall be made.

702. Works of art, collections in illustration of the progress of the arts, sciences, or manufactures, photographs, works in terra cotta, parian, pottery, or porcelain, antiquities and artistic copies thereof in metal or other material, imported in good faith for exhibition at a fixed place by any State or by any society or institution established for the encouragement of the arts, sciences, or education, or for a municipal corporation, and all like articles imported in good faith by any society or association, or for a municipal corporation for the purpose of erecting a public monument, and not intended for sale, nor for any other purpose than herein expressed; but bonds shall be given under such rules and regulations as the Secretary of the Treasury may prescribe, for the payment of lawful duties which may accrue should any of the articles aforesaid be sold, transferred, or used contrary to this provision, and such articles shall be subject, at any time, to examination and inspection by the proper officers of the customs: *Provided*, That the privileges of this and the preceding section shall not be allowed to associations or corporations engaged in or connected with business of a private or commercial character.

703. Works of art, the production of American artists residing temporarily abroad, or other works of art, including pictorial paintings on glass, imported expressly for presentation to a national institution, or to any State or municipal corporation, or incorporated religious society, college, or other public institution, except stained or painted window glass or stained or painted glass windows; but such exemption shall be subject to such regulations as the Secretary of the Treasury may prescribe.

704. Yams.

705. Zaffer.

SEC. 3. That for the purpose of equalizing the trade of the United States with foreign countries, and their colonies, producing and exporting to this country the following articles: Argols, or crude tartar, or wine lees, crude; brandies, or other spirits manufactured or distilled from grain or other materials; champagne and all other sparkling wines; still wines; and vermouth; paintings and statuary; or any of them, the President be, and he is hereby, authorized, as soon as may be after the passage of this act, and from time to time thereafter, to enter into negotiations with the governments of those countries exporting to the United States the above-mentioned articles, or any of them, with a view to the arrangement of commercial agreements in which reciprocal and equivalent concessions may be secured in favor of the products and manufactures of the United States; and whenever the Government of any country, or colony, producing and exporting to the United States the above-mentioned articles, or any of them, shall enter into a commercial agreement with the United States, or make a concession in favor of the products, or manufactures thereof, or any of them, in the judgment of the President, shall be equal, or equivalent, he shall be, and he is hereby, authorized, and empowered to suspend, during the term of such agreement or concession, by proclamation, the duties imposed by the imposition and collection of the duties provided in this act, on such article or articles so exported to the United

States from such country or colony, and thereupon and thereafter the duties levied, collected, and paid upon such article or articles shall be as follows, namely:

Angois, or crude tartar, or wine lees, crude, five per centum ad valorem.

Brandies, or other spirits manufactured or distilled from grain or other materials, one dollar and seventy-five cents per proof gallon.

Champagne and all other sparkling wines, in bottles containing not more than one quart and more than one pint, six dollars per dozen; containing not more than one pint each and more than one half pint, three dollars per dozen; containing one half pint each or less, one dollar and fifty cents per dozen; in bottles or other vessels containing more than one quart each, in addition to six dollars per dozen bottles on the quantities in excess of one quart, at the rate of one dollar and ninety cents per gallon.

Still wines, and vermouth, in casks, thirty-five cents per gallon; in bottles or jugs, per case of one dozen bottles or jugs containing each not more than one quart and more than one pint, or twenty-four bottles or jugs containing each not more than one pint, one dollar and twenty-five cents per case, and any excess beyond these quantities found in such bottles or jugs shall be subject to a duty of four cents per pint or fractional part thereof, but no separate or additional duty shall be assessed upon the bottles or jugs.

Paintings in oil or water colors, pastels, pen-and-ink drawings, and statuary, fifteen per centum ad valorem.

The President shall have power, and it shall be his duty, whenever he shall be satisfied that any such agreement in this section mentioned is not being fully executed by the Government with which it shall have been made, to revoke such suspension and notify such Government thereof.

And it is further provided that with a view to secure reciprocal trade with countries producing the following articles, whenever and so often as the President shall be satisfied that the Government of any country, or colony of such Government, producing and exporting directly or indirectly to the United States coffee, tea, and tonquin, tonqua, or tonka beans, and vanilla beans, or any of such articles, imposes duties or other exactions upon the agricultural, manufactured, or other products of the United States, which, in view of the introduction of such coffee, tea, and tonquin, tonqua, or tonka beans, and vanilla beans, into the United States, as in this act hereinbefore provided for, he may deem to be reciprocally unequal and unreasonable, he shall have the power and it shall be his duty to suspend, by proclamation to that effect, the provisions of this act relating to the free introduction of such coffee, tea, and tonquin, tonqua, or tonka beans, and vanilla beans, of the products of such country or colony, for such time as he shall deem just; and in such case and during such suspension duties shall be levied, collected, and paid upon coffee, tea, and tonquin, tonqua, or tonka beans, and vanilla beans, the products or exports, direct or indirect, from such designated country, as follows:

On coffee, three cents per pound.

On tea, ten cents per pound.

On tonquin, tonqua, or tonka beans, fifty cents per pound; vanilla beans, two dollars per pound; vanilla beans, commercially known as cuts, one dollar per pound.

SEC. 4. That whenever the President of the United States, by and with the advice and consent of the Senate, with a view to secure reciprocal trade with foreign countries, shall, within the period of two years from and after the passage of this act, enter into commercial treaty or treaties with any other country or countries concerning the admission into any such country or countries of the goods, wares, and merchandise of the United States and their use and disposition therein, deemed to be for the interests of the United States, and in such treaty or treaties, in consideration of the advantages accruing to the United States therefrom, shall provide for the reduction during a specified period, not exceeding five years, of the duties imposed by this act, to the extent of not more than twenty per centum thereof, upon such goods, wares, or merchandise as may be designated therein of the country or countries with which such treaty or treaties shall be made as in this section provided for; or shall provide for the transfer during such period from the dutiable list of this act to the free list thereof of such goods, wares, and merchandise, being the natural

products of such foreign country or countries and not of the United States; or shall provide for the retention upon the free list of this act during a specified period, not exceeding five years, of such goods, wares, and merchandise now included in said free list as may be designated therein; and when any such treaty shall have been duly ratified by the Senate and approved by Congress, and public proclamation made accordingly, then and thereafter the duties which shall be collected by the United States upon any of the designated goods, wares, and merchandise from the foreign country with which such treaty has been made shall, during the period provided for, be the duties specified and provided for in such treaty, and none other.

SEC. 5. That whenever any country, dependency, or colony shall pay or bestow, directly or indirectly, any bounty or grant upon the exportation of any article or merchandise from such country, dependency, or colony, and such article or merchandise is dutiable under the provisions of this act, then upon the importation of any such article or merchandise into the United States, whether the same shall be imported directly from the country of production or otherwise, and whether such article or merchandise is imported in the same condition as when exported from the country of production or has been changed in condition by remanufacture or otherwise, there shall be levied and paid, in all such cases, in addition to the duties otherwise imposed by this act, an additional duty equal to the net amount of such bounty or grant, however the same be paid or bestowed. The net amount of all such bounties or grants shall be from time to time ascertained, determined, and declared by the Secretary of the Treasury, who shall make all needful regulations for the identification of such articles and merchandise and for the assessment and collection of such additional duties.

SEC. 6. That there shall be levied, collected, and paid on the importation of all raw or unmanufactured articles, not enumerated or provided for in this act, a duty of ten per centum ad valorem, and on all articles manufactured, in whole or in part, not provided for in this act, a duty of twenty per centum ad valorem.

SEC. 7. That each and every imported article, not enumerated in this act, which is similar, either in material, quality, texture, or the use to which it may be applied, to any article enumerated in this act as chargeable with duty, shall pay the same rate of duty which is levied on the enumerated article which it most resembles in any of the particulars before mentioned; and if any nonenumerated article equally resembles two or more enumerated articles on which different rates of duty are chargeable, there shall be levied on such nonenumerated article the same rate of duty as is chargeable on the article which it resembles paying the highest rate of duty; and on articles not enumerated, manufactured of two or more materials, the duty shall be assessed at the highest rate at which the same would be chargeable if composed wholly of the component material thereof of chief value; and the words "component material of chief value," wherever used in this act, shall be held to mean that component material which shall exceed in value any other single component material of the article; and the value of each component material shall be determined by the ascertained value of such material in its condition as found in the article. If two or more rates of duty shall be applicable to any imported article, it shall pay duty at the highest of such rates.

SEC. 8. That all articles of foreign manufacture, such as are usually or ordinarily marked, stamped, branded, or labeled, and all packages containing such or other imported articles, shall, respectively, be plainly marked, stamped, branded, or labeled in legible English words in a conspicuous place, so as to indicate the country of their origin and the quantity of their contents; and until so marked, stamped, branded or labeled they shall not be delivered to the importer. Should any article of imported merchandise be marked, stamped, branded, or labeled so as to indicate a quantity, number, or measurement in excess of the quantity, number, or measurement actually contained in such article, no delivery of the same shall be made to the importer until the mark, stamp, brand, or label, as the case may be, shall be changed so as to conform to the facts of the case.

SEC. 9. That section thirty-three hundred and forty-one of the Revised Statutes of the United States be, and hereby is, amended to read as follows:

"SEC. 3341. The Commissioner of Internal Revenue

shall cause to be prepared, for the payment of such tax, suitable stamps denoting the amount of tax required to be paid on the foregoing barrels, and having thereon printed, either whole or eighth of a barrel of such fermented liquors; and shall cause to be prepared another receipt for the purpose hereinafter mentioned, and shall furnish the same to the collectors of internal revenue, who shall each be required to keep on hand, and have a sufficient supply of permits and a supply of stamps equal in amount to two months' sales thereof, at their own private brewery or brewery warehouses in his district; and such stamps shall be sold, and permits granted and delivered by such collectors, only to the brewers of that district respectively.

* Such collectors shall keep an account of the number of permits delivered and of the number and value of the permits sold by them to each broker."

Sec. 19. That section thirty three hundred and twenty-four of the Revised Statutes, of the United States be amended, be, and the same is hereby, further amended, so as to read as follows:

On cigars which shall be manufactured and sold, or removed for consumption or sale, there shall be assessed and collected the following taxes, to be paid by the manufacturer thereof: On cigars of all descriptions made of tobacco, or any substitute therefor, and weighing more than three pounds per thousand, three dollars per thousand; on cigars, made of tobacco, of any substitute therefor, and weighing not more than three pounds per thousand, one dollar per thousand; on cigarettes, made of tobacco, or any substitute therefor, and weighing more than three pounds per thousand, three dollars per thousand; on cigarettes, made of tobacco, or any substitute therefor, and weighing not more than three pounds per thousand, one dollar per thousand; *Provided*, That all rolls of tobacco, or any substitute therefor, wrapped with tobacco, shall be classed as cigars, and all rolls of tobacco, or any substitute therefor, wrapped in paper or any substance other than tobacco, shall be classed as cigarettes.

* And the Commissioner of Internal Revenue, with the approval of the Secretary of the Treasury, shall provide dies and adhesive stamps for cigars weighing not more than three pounds per thousand; *Provided*, That such stamps shall be in denominations of ten, twenty, fifty, and one hundred, and the laws and regulations governing the packing and removal for sale of cigarettes, and the affixing and canceling of the stamps on the packages thereof, shall apply to cigars weighing not more than three pounds per thousand.

* None of the packages of smoking tobacco and flue-cut chewing tobacco and cigarettes prescribed by law shall be permitted to have packed in, or attached to, or connected with, them, any article or thing whatsoever, other than the manufacturers' wrappers and labels, the internal revenue stamp and the tobacco or cigarettes, respectively, put up thereon, on which tax is required to be paid under the internal revenue laws; nor shall there be affixed to, or branded, stamped, marked, written, or printed upon, said packages, or their contents, any promise or other offer, or any order or certificate for, any gift, prize, premium, payment, or reward."

Sec. 11. That no article of imported merchandise which shall copy or simulate the name or trade mark of any domestic manufacture or manufacturer, or shall bear a name or mark which is calculated to induce the public to believe that the article is manufactured in the United States, shall be admitted to entry at any customhouse of the United States. And in order to aid the officers of the customs in enforcing this prohibition, any domestic manufacturer who has adopted trade marks may require his name and residence and a description of his trade marks to be recorded in books which shall be kept for that purpose in the Department of the Treasury, under such regulations as the Secretary of the Treasury shall prescribe, and may furnish to the department facsimiles of such trade marks; and thereupon the Secretary of the Treasury shall cause one or more copies of the same to be transmitted to each collector of duty proper officer of the customs.

SEC. 12. That all materials of foreign production which may be necessary for the construction of vessels *built in* the United States for foreign account and ownership, and for the purpose of being employed in the foreign trade, including the trade between the Atlantic and the Gulf ports of the United States, and all such materials necessary for the building of their machinery, and all articles

Also 34. That the northwesterly portion of an artesian well No. 24, to the primary aquifer, happens in the same way, to the secondary aquifer and you change the Artesian flow, carrying back, and for other purposes, "supposed" down to the north, northwest, and south, and the flow is distributed more or less in all directions.

54. It is that all efforts of foreign or domestic production needed and getting well-known. These include advertising and related manufacturing work done for supplies and including equipment of goods of the United States engaged in foreign trade or in trade between the Atlantic and Pacific coasts of the United States may be so well known from and beyond the coast. The duty or of internal production, as the same paper, under such regulations as the Secretary of the Treasury may prescribe, but no such articles shall be deemed as any part of the United States.

Sec. 10. That all articles manufactured in this country out of part of imported materials, or of quantities of such materials as are subject to a special revenue tax, and intended for exportation, and which are being charged with duty, and without having paid an internal revenue stamp affixed thereto, shall, at the request of the officers as the Secretary of the Treasury may prescribe, in order to be so manufactured and exported, be taken and manufactured in bonded warehouses, similar to those known and designated in Treasury regulations as bonded warehouses, class six. *Provided*, That the manufacture of such articles shall first give satisfactory bonds for the faithful observance of all the provisions of law and of such regulations as shall be prescribed by the Secretary of the Treasury. *Provided further*, That the manufacture of distilled spirits from grain, starch, and molasses, or sugar, including all alterations or mixtures of them, or either of them, shall not be permitted in such manufacturing warehouses.

Whenever goods manufactured in any bonded warehouse established under the provisions of the preceding paragraph shall be exported directly therefrom, or shall be duly laden for transportation and immediate exportation under the supervision of the proper officers who shall be duly designated for that purpose, such goods shall be exempt from duty and from the requirements relating to revenue stamps.

Any materials used in the manufacture of such goods, and any packages, coverings, contents, brands, and labels used in putting up the same may, under the regulations of the Secretary of the Treasury, be conveyed without the payment of revenue tax or duty into any bonded manufacturing warehouse, and imported goods may, under the aforesaid regulations, be transferred without the exaction of duty from any bonded warehouse into any bonded manufacturing warehouse; but this privilege shall not be held to apply to instruments, machinery, or apparatus to be used in the construction or repair of any bonded manufacturing warehouse or for the preservation of the business carried on therein.

No articles or materials received into such manufacturing warehouse shall be reexported, moved therefrom except for direct shipment, or taken on for transportation and transshipment without being under the supervision of the officers authorized by the collector of the port, or for such shipment and exportation or transportation, as the case may be, to the destination, that mark or otherwise, the transportation, and the nature of the goods and services rendered under the supervision of a customs officer, and at the expense of the

A careful account shall be kept by the collector of all merchandise delivered by him to any bonded manufacturing warehouse, and a sworn monthly return, verified by the customs officers in charge, shall be made by the manufacturers containing a detailed statement of all imported merchandise used by him in the manufacture of exported articles.

Before commencing business the proprietor of any manufacturing warehouse shall file with the Secretary of the Treasury a list of all the articles intended to be manufactured in such warehouse, and state the formula of manufacture and the names and quantities of the ingredients to be used therein.

Articles manufactured under these provisions may be withdrawn under such regulations as the Secretary of the Treasury may prescribe for transportation and delivery into any bonded warehouse at an exterior port for the sole purpose of immediate export therefrom.

The provisions of Revised Statutes thirty-four hundred and thirty-three shall, so far as may be practicable, apply to any bonded manufacturing warehouse established under this act and to the merchandise conveyed therein.

SEC. 16. That all persons are prohibited from importing into the United States from any foreign country any obscene book, pamphlet, paper, writing, advertisement, circular, print, picture, drawing, or other representation, figure, or image on or of paper or other material, or any cast, instrument, or other article of an immoral nature, or any drug or medicine, or any article whatever for the prevention of conception or for causing unlawful abortion, or any lottery ticket or any advertisement of any lottery. No such articles, whether imported separately or contained in packages with other goods entitled to entry, shall be admitted to entry; and all such articles shall be proceeded against, seized, and forfeited by due course of law. All such prohibited articles and the package in which they are contained in the course of importation shall be detained by the officer of customs, and proceedings taken against the same as hereinafter prescribed, unless it appears to the satisfaction of the collector of customs that the obscene articles contained in the package were inclosed therein without the knowledge or consent of the importer, owner, agent, or consignee: *Provided*, That the drugs hereinbefore mentioned, when imported in bulk and not put up for any of the purposes hereinbefore specified, are excepted from the operation of this section.

SEC. 17. That whoever, being an officer, agent, or employee of the Government of the United States, shall knowingly aid or abet any person engaged in any violation of any of the provisions of law prohibiting importing, advertising, dealing in, exhibiting, or sending or receiving by mail obscene or indecent publications or representations, or means for preventing conception or procuring abortion, or other articles of indecent or immoral use or tendency, shall be deemed guilty of a misdemeanor, and shall for every offense be punishable by a fine of not more than five thousand dollars, or by imprisonment at hard labor for not more than ten years, or both.

SEC. 18. That any judge of any district or circuit court of the United States, within the proper district, before whom complaint in writing of any violation of the two preceding sections is made, to the satisfaction of such judge, and founded on knowledge or belief, and if upon belief, setting forth the grounds of such belief, and supported by oath or affirmation of the complainant, may issue, conformably to the Constitution, a warrant directed to the marshal or any deputy marshal in the proper district, directing him to search for, seize, and take possession of any such article or thing mentioned in the two preceding sections, and to make due and immediate return thereof to the end that the same may be condemned and destroyed by proceedings, which shall be conducted in the same manner as other proceedings in the case of municipal seizure, and with the same right of appeal or writ of error.

SEC. 19. That machinery for repair may be imported into the United States without payment of duty, under bond, to be given in double the appraised value thereof, to be withdrawn and exported after said machinery shall have been repaired; and the Secretary of the Treasury is authorized and directed to prescribe such rules and regulations as may be necessary to protect the revenue against fraud and secure the identity and character of all such importations when again withdrawn and exported, re-

stricting and limiting the export and withdrawal to the same port of entry where imported, and also limiting all bonds to a period of time of not more than six months from the date of the importation.

SEC. 20. That the produce of the forests of the State of Maine upon the Saint John river and its tributaries, owned by American citizens, and sawed or hewed in the Province of New Brunswick by American citizens, the same being otherwise unmanufactured in whole or in part, which is now admitted into the ports of the United States free of duty, shall continue to be so admitted, under such regulations as the Secretary of the Treasury shall from time to time prescribe.

SEC. 21. That the produce of the forests of the State of Maine upon the Saint Croix river and its tributaries owned by American citizens, and sawed and hewed in the Province of New Brunswick by American citizens, the same being otherwise unmanufactured in whole or in part, shall be admitted into the ports of the United States free of duty, under such regulations as the Secretary of the Treasury shall from time to time prescribe.

SEC. 22. That a discriminating duty of ten per centum ad valorem, in addition to the duties imposed by law, shall be levied, collected, and paid on all goods, wares, or merchandise which shall be imported in vessels not of the United States, or which being the production or manufacture of any foreign country not contiguous to the United States, shall come into the United States from such contiguous country; but this discriminating duty shall not apply to goods, wares, or merchandise which shall be imported in vessels not of the United States, entitled at the time of such importation by treaty or convention to be entered in the ports of the United States on payment of the same duties as shall then be payable on goods, wares, and merchandise imported in vessels of the United States, nor to such foreign products or manufactures as shall be imported from such contiguous countries in the usual course of strictly retail trade.

SEC. 23. That no goods, wares, or merchandise, unless in cases provided for by treaty, shall be imported into the United States from any foreign port or place, except in vessels of the United States, or in such foreign vessels as truly and wholly belong to the citizens or subjects of that country of which the goods are the growth, production, or manufacture, or from which such goods, wares, or merchandise can only be, or most usually are, first shipped for transportation. All goods, wares, or merchandise imported contrary to this section, and the vessel wherein the same shall be imported, together with her cargo, tackle, apparel, and furniture, shall be forfeited to the United States; and such goods, wares, or merchandise, ship, or vessel, and cargo shall be liable to be seized, prosecuted, and condemned in like manner, and under the same regulations, restrictions, and provisions as have been heretofore established for the recovery, collection, distribution, and remission of forfeitures to the United States by the several revenue laws.

SEC. 24. That the preceding section shall not apply to vessels or goods, wares, or merchandise imported in vessels of a foreign nation which does not maintain a similar regulation against vessels of the United States.

SEC. 25. That the importation of neat cattle and the hides of neat cattle from any foreign country into the United States is prohibited: *Provided*, That the operation of this section shall be suspended as to any foreign country or countries, or any parts of such country or countries, whenever the Secretary of the Treasury shall officially determine, and give public notice thereof that such importation will not tend to the introduction or spread of contagious or infectious diseases among the cattle of the United States; and the Secretary of the Treasury is hereby authorized and empowered, and it shall be his duty, to make all necessary orders and regulations to carry this section into effect, or to suspend the same as herein provided, and to send copies thereof to the proper officers in the United States, and to such officers or agents of the United States in foreign countries as he shall judge necessary.

SEC. 26. That any person convicted of a willful violation of any of the provisions of the preceding section shall be fined not exceeding five hundred dollars, or imprisoned not exceeding one year, or both, in the discretion of the court.

SEC. 27. That upon the reimportation of articles once exported, of the growth, product, or manufacture of the United States, upon which no internal tax has been assessed or paid, or upon which such tax has been paid

and refunded by allowance or drawback, there shall be levied, collected, and paid a duty equal to the tax imposed by the internal-revenue laws upon such articles, except articles manufactured in bonded warehouses and exported pursuant to law, which shall be subject to the same rate of duty as if originally imported.

Sec. 28. That whenever any vessel laden with merchandise, in whole or in part subject to duty, has been sunk in any river, harbor, bay, or waters subject to the jurisdiction of the United States, and within its limits, for the period of two years, and is abandoned by the owner thereof, any person who may raise such vessel shall be permitted to bring any merchandise recovered therefrom into the port nearest to the place where such vessel was so raised free from the payment of any duty thereupon, but under such regulations as the Secretary of the Treasury may prescribe.

Sec. 29. That the works of manufacturers engaged in smelting or refining metals, or both smelting and refining, in the United States may be designated as bonded warehouses under such regulations as the Secretary of the Treasury may prescribe: *Provided*, That such manufacturers shall first give satisfactory bonds to the Secretary of the Treasury. Ores or metals in any crude form requiring smelting or refining to make them readily available in the arts, imported into the United States to be smelted or refined and intended to be exported in a refined but unmanufactured state, shall, under such rules as the Secretary of the Treasury may prescribe, and under the direction of the proper officer, be removed in original packages or in bulk from the vessel or other vehicle on which they have been imported, or from the bonded warehouse in which the same may be, into the bonded warehouse in which such smelting or refining, or both, may be carried on, for the purpose of being smelted or refined, or both, without payment of duties thereon, and may there be smelted or refined, together with other metals of home or foreign production. *Provided*, That each day a quantity of refined metal equal to ninety per centum of the amount of imported metal smelted or refined that day shall be set aside, and such metal so set aside shall not be taken from said works except for transportation to another bonded warehouse or for exportation, under the direction of the proper officer having charge thereof as aforesaid, whose certificate, describing the articles by their marks or otherwise, the quantity, the date of importation, and the name of vessel or other vehicle by which it was imported, with such additional particulars as may from time to time be required, shall be received by the collector of customs as sufficient evidence of the exportation of the metal, or it may be removed under such regulations as the Secretary of the Treasury may prescribe, upon entry and payment of duties, for domestic consumption, and the exportation of the ninety per centum of metals hereinbefore provided for shall entitle the ores and metals imported under the provisions of this section to admission without payment of the duties thereon. *Provided further*, That in respect to lead ores imported under the provisions of this section the refined metal set aside shall either be re-exported or the regular duties paid thereon within six months from the date of the receipt of the ore. All labor performed and services rendered under these regulations shall be under the supervision of an officer of the customs, to be appointed by the Secretary of the Treasury, and at the expense of the manufacturer.

Sec. 30. That where imported materials on which duties have been paid are used in the manufacture of articles manufactured or produced in the United States, there shall be allowed on the exportation of such articles a drawback equal in amount to the duties paid on the materials used, less one per centum of such duties: *Provided*, That when the articles exported are made in part from domestic materials the imported materials, or the parts of the articles made from such materials, shall so appear in the completed articles that the quantity or measure thereof may be ascertained: *And provided further*, That the drawback on any article allowed under existing law shall be continued at the rate herein provided. That the imported materials used in the manufacture or production of articles entitled to drawback of customs duties when exported shall, in all cases where drawback of duties paid on such materials is claimed, be identified, the quantity of such materials used and the amount of duties paid thereon shall be ascertained, the facts of the manufacture or production of such articles in the United States and their exportation there-

from shall be determined, and the drawback due thereon shall be paid to the manufacturer, producer, or exporter, to the agent of either or to the person to whom such manufacturer, producer, exporter or agent shall in writing order such drawback paid, under such regulations as the Secretary of the Treasury may prescribe.

Sec. 31. That all goods, wares, articles, and merchandise manufactured wholly or in part in any foreign country by convict labor shall not be entitled to entry at any of the ports of the United States, and the exportation thereof is hereby prohibited, and the Secretary of the Treasury is authorized and directed to prescribe such regulations as may be necessary for the enforcement of this provision.

Sec. 32. That sections seven and eleven of the act entitled "An Act to simplify the laws in relation to the collection of the revenue," approved June tenth, eighteen hundred and ninety, be, and the same are hereby, amended so as to read as follows:

"**Sec. 7.** That the owner, consignee, or agent of any imported merchandise which has been actually purchased may, at the time when he shall make and verify his written entry of such merchandise, but not afterward, make such addition in the entry to the cost or value given in the invoice or pro forma invoice or statement in form of an invoice, which he shall produce with his entry, as in his opinion may raise the same to the actual market value or wholesale price of such merchandise at the time of exportation to the United States, in the principal markets of the country from which the same has been imported, but no such addition shall be made upon entry to the invoice value of any imported merchandise obtained otherwise than by actual purchase; and the collector within whose district any merchandise may be imported or entered, whether the same has been actually purchased or procured otherwise than by purchase, shall cause the actual market value or wholesale price of such merchandise to be appraised; and if the appraised value of any article of imported merchandise subject to an ad valorem duty or to a duty based upon or regulated in any manner by the value thereof shall exceed the value declared in the entry, there shall be levied, collected, and paid, in addition to the duties imposed by law on such merchandise, an additional duty of one per centum of the total appraised value thereof for each one per centum that such appraised value exceeds the value declared in the entry, but the additional duties shall only apply to the particular article or articles in each invoice that are so undervalued, and shall be limited to fifty per centum of the appraised value of such article or articles. Such additional duties shall not be construed to be penal, and shall not be remitted, nor payment thereof in any way avoided, except in cases arising from a manifest clerical error, nor shall they be refunded in case of exportation of the merchandise, or on any other account, nor shall they be subject to the benefit of drawback: *Provided*, That if the appraised value of any merchandise shall exceed the value declared in the entry by more than fifty per centum, except when arising from a manifest clerical error, such entry shall be held to be presumptively fraudulent, and the collector of customs shall seize such merchandise and proceed as in case of forfeiture for violation of the customs laws, and in any legal proceeding that may result from such seizure, the undervaluation as shown by the appraisal shall be presumptive evidence of fraud, and the burden of proof shall be on the claimant to rebut the same and forfeiture shall be adjudged unless he shall rebut such presumption of fraudulent intent by sufficient evidence. The forfeiture provided for in this section shall apply to the whole of the merchandise or the value thereof in the case or package containing the particular article or articles in each invoice which are undervalued: *Provided further*, That all additional duties, penalties or forfeitures applicable to merchandise entered by a duly certified invoice, shall be alike applicable to merchandise entered by a pro forma invoice or statement in the form of an invoice, and no forfeiture or disability of any kind incurred under the provisions of this section shall be remitted or mitigated by the Secretary of the Treasury. The duty shall not, however, be assessed or collected upon an amount less than the invoice or entry value."

"**Sec. 11.** That, when the actual market value of any article of imported merchandise, wholly or partly manufactured in any foreign country, shall exceed the value declared in the entry, there shall be levied, collected, and paid, in addition to the duties imposed by law, of any article of imported merchandise, wholly or partly manufactured in any foreign country, an additional duty, or to a duty based upon or regulated in any manner by the value thereof, as may be necessary for the enforcement of this provision."

tion of the appraising officer, such officer shall use all available means in his power to ascertain the cost of production of such merchandise at the time of exportation to the United States, and at the place of manufacture; such cost of production to include the cost of materials and of fabrication, all general expenses covering such and every outlay of whatsoever nature incident to such production, together with the expenses of preparing and putting up such merchandise ready for shipment, and an addition of not less than eight nor more than fifty per centum upon the total cost as thus ascertained; and in no case shall such merchandise be appraised upon original appraisal at a price amounting at less than the total cost of production as thus ascertained. It shall be lawful for appraising officers, in determining the dutiable value of such merchandise, to take into consideration the wholesale price at which such or similar merchandise is sold in the United States, due allowance being made for estimated duties thereon, the cost of transportation, insurance, and other necessary expenses from the place of shipment to the United States, and a reasonable commission, if any has been paid, not exceeding 1 per centum.

SEC. 33. That on and after the day when this act shall go into effect, all goods, wares, and merchandise previously imported, for which no entry has been made, and all goods, wares, and merchandise previously entered without payment of duty and under bond for warehousing, transportation, or any other purpose, for which no permit of delivery to the importer or his agent, has been issued, shall be subjected to the duties imposed by this act and to no other duty, upon the entry or the withdrawal thereof: *Provided*, That when duties are based upon the weight of merchandise deposited in any public or private bonded warehouse, said duties shall be levied and collected upon the weight of such merchandise at the time of its entry.

SEC. 34. That sections one to twenty-four, both inclusive, of an act entitled "An Act to reduce taxation, to provide revenue for the Government, and for other purposes," which became a law on the twenty-eighth day of August, eighteen hundred and ninety-four, and all acts and parts of acts inconsistent with the provisions of this act are hereby repealed, said repeal to take effect on and after the passage of this act, but the repeal of existing laws or modifications thereof embraced in this act shall not affect any act done, or any right accruing or accrued, or any suit or proceeding had or commenced in any civil cause before the said repeal or modifications; but all rights and liabilities under said laws shall continue and may be enforced in the same manner as if said repeal or modifications had not been made. Any offenses committed and all penalties or forfeitures or liabilities incurred prior to the passage of this act under any statute embraced in or changed, modified, or repealed by this act may be prosecuted or punished in the same manner and with the same effect as if this act had not been passed. All acts of limitation, whether applicable to civil causes and proceedings or to the prosecution of offenses or for the recovery of penalties or forfeitures embraced in or modified, changed, or repealed by this act shall not be affected thereby; and all suits, proceedings, or prosecutions, whether civil or criminal, for causes arising or acts done or committed prior to the passage of this act may be commenced and prosecuted within the same time and with the same effect as if this act had not been passed: *And provided further*, That nothing in this act shall be construed to repeal the provisions of section three thousand and five hundred and fifteen of the Revised Statutes as amended by the act approved February twenty-third, eighteen hundred and eighty-seven, relating to the abandonment of merchandise to underwriters or the salvors of property, and the amendments thereto: *And provided further*, That nothing in this act shall be construed to repeal or in any manner affect the sections numbered seventy-three, seventy-four, seventy-five, seventy-six, and seventy-seven of an act entitled "An Act to reduce taxation, to provide revenue for the Government, and for other purposes," which became a law on the twenty-eighth day of August, eighteen hundred and ninety-four.

Approved, July 24, 1897.

Appropriation Bills.—The Congress was obliged to take up and pass four appropriation bills—that making appropriations to supply deficiencies; that for the Agricultural Department;

that for the Indian Department; and that for sundry civil expenses.

In the deficiency bill there was inserted a clause accepting the invitation to take part in the Paris Exposition of 1900, and appropriating \$25,000 for preliminary expenses and the salary of a commissioner. There was also a provision for fireproof buildings and a pavilion at Ellis island, and for the enlargement of the island by a system of bulk-heads, the whole improvement of the immigrant station to cost \$600,000, of which \$150,000 were appropriated. There was moreover a condition incorporated in the measure to the effect that no contract for armor plate should be at a rate exceeding \$300 for a ton of 2,240 pounds, and authorizing the Secretary of the Navy to secure such terms, or, if need be, to prepare for Government manufacture of armor plates.

In the Indian bill there was a contest over the question of sectarian schools, and the policy of the Government was declared as follows: "That the Secretary of the Interior may make contracts with contract schools, apportioning, as near as may be, the amount so contracted among schools of various denominations for the education of Indian pupils during the fiscal year 1898, but shall only make such contracts at places where nonsectarian schools can not be provided for such Indian children, and to an amount not exceeding 40 per cent. of the amount so used for the fiscal year 1895." The question of opening to entry the rich gilsonite deposits in the Uncompahgre reservation was met by declaring open such agricultural lands as have not been allotted to the Uncompahgre Indians on April 1, 1898, to entry, but reserving to the United States title in all lands containing gilsonite, asphalt, or other like substances.

In the sundry civil bill there was new legislation as to the forest reserves of the country. The sum of \$150,000 was appropriated for a survey of all such reservations; but while the full authority of the President under the act of March 3, 1891, to revoke, modify, or suspend executive proclamations as to such reservations was affirmed, it was provided that the proclamation of President Cleveland, Feb. 22, 1897, reserving lands in Wyoming, Utah, Montana, Washington, Idaho, and South Dakota shall be suspended until March 1, 1898, at which date such lands shall become once more subject to presidential action. The following general provisions were added:

"All public lands heretofore designated and reserved by the President of the United States under the provisions of the act approved March 3, 1891, the orders for which shall be and remain in full force and effect, unsuspended and unrevoked, and all public lands that may hereafter be set aside and reserved as public forest reserves under said act, shall be as far as practicable controlled and administered in accordance with the following provisions:

"No public forest reservation shall be established, except to improve and protect the forest within the reservation or for the purpose of securing favorable conditions of water flows and to furnish a continuous supply of timber for the use and necessities of citizens of the United States; but it is not the purpose or intent of these provisions or of the act providing for such reservations to authorize the inclusion therein of lands more valuable for the mineral therein or for agricultural purposes than for forest purposes.

"The Secretary of the Interior shall make provisions for the protection against destruction by fire and depredations upon the public forests and forest reservations which may have been set aside or which may be hereafter set aside under the said act of March 3, 1891, and which may be continued;

and he may make such rules and regulations and establish such service as will insure the objects of such reservations, namely, to regulate their occupancy and use and to preserve the forests thereon from destruction; and any violation of the provisions of this act or such rules and regulations shall be punished as is provided for in the act of June 4, 1888, amending section 5388 of the Revised Statutes of the United States.

"For the purpose of preserving the living and growing timber and promoting the younger growth on forest reservations, the Secretary of the Interior, under such rules and regulations as he shall prescribe, may cause to be designated and appraised so much of the dead, matured, or large growth of trees found upon such forest reservations as may be compatible with the utilization of the forests thereon, and may sell the same for not less than the appraised value in such quantities to each purchaser as he shall prescribe, to be used in the State or Territory in which such timber reservation may be situated, respectively, but not for export therefrom. Before such sale shall take place notice thereof shall be given by the Commissioner of the General Land Office for not less than sixty days, by publication in a newspaper of general circulation, published in the county in which the timber is situated, if any is therein published, and if not, then in a newspaper of general circulation published nearest to the reservation, and also in a newspaper of general circulation published at the capital of the State or Territory where such reservation exists; payments for such timber to be made to the receiver of the local land office of the district wherein said timber may be sold, under such rules and regulations as the Secretary of the Interior may prescribe; and the moneys arising therefrom shall be accounted for by the receiver of such land office to the Commissioner of the General Land Office in a separate account, and shall be covered into the Treasury. Such timber, before being sold, shall be marked and designated, and shall be cut and removed under the supervision of some person appointed for that purpose by the Secretary of the Interior, not interested in the purchase or removal of such timber nor in the employment of the purchaser thereof. Such supervisor shall make report in writing to the Commissioner of the General Land Office and to the receiver in the land office in which such reservation shall be located of his doings in the premises.

"The Secretary of the Interior may permit, under regulations to be prescribed by him, the use of timber and stone found upon such reservations, free of charge, by *bona fide* settlers, miners, residents, and prospectors for minerals, for firewood, fencing, buildings, mining, prospecting, and other domestic purposes, as may be needed by such persons for such purposes, such timber to be used within the State or Territory, respectively, where such reservations may be located.

"Nothing herein shall be construed as prohibiting the egress or ingress of actual settlers residing within the boundaries of such reservations, or from crossing the same to and from their property or homes; and such wagon roads and other improvements may be constructed thereon as may be necessary to reach their homes and to utilize their property under such rules and regulations as may be prescribed by the Secretary of the Interior. Nor shall anything herein prohibit any person from entering upon such forest reservations for all proper and lawful purposes, including that of prospecting, locating, and developing the mineral resources thereof: *Provided*, That such persons comply with the rules and regulations covering such forest reservations.

"That in cases in which a tract covered by an unperfected *bona fide* claim, in which a patent is included within the limits of a public forest reservation the settler or owner thereof may, after he desires to do so, relinquish the tract to the Government, and may select in lieu thereof a tract of vacant land open to settlement not exceeding in area the tract covered by his claim or patent; and no charge shall be made in such cases for making the abstract of record or issuing the patent to cover the tract selected: *Provided further*, That in cases of unperfected claims the requirements of the laws respecting settlement, residence, improvements, etc., are complied with on the new claims, credit being allowed for the time spent on the relinquished claims.

"The settlers residing within the exterior boundaries of such forest reservations, or in the vicinity thereof, may maintain schools and churches within such reservation, and for that purpose may occupy any part of the said forest reservation, not exceeding two acres for each schoolhouse and one acre for a church.

"The jurisdiction, both civil and criminal, over persons within such reservations shall not be affected or changed by reason of the existence of such reservations, except so far as the punishment of offenses against the United States therein is concerned, the intent and meaning of this provision being that the State wherein any such reservation is situated shall not, by reason of the establishment thereof, lose its jurisdiction, nor the inhabitants thereof their rights and privileges as citizens, or be absolved from their duties as citizens of the State.

"All waters on such reservations may be used for domestic, mining, milling, or irrigation purposes, under the laws of the State wherein such forest reservations are situated, or under the laws of the United States and the rules and regulations established thereunder.

"Upon the recommendation of the Secretary of the Interior, with the approval of the President, after sixty days' notice thereof, published in two papers of general circulation in the State or Territory wherein any forest reservation is situated, and near the said reservation, any public lands embraced within the limits of any forest reservation, which, after due examination by personal inspection of a competent person appointed for that purpose by the Secretary of the Interior, shall be found better adapted for mining or for agricultural purposes than for forest usage may be restored to the public domain. And any mineral lands in any forest reservation which have been or which may be shown to be such, and subject to entry under the existing mining laws of the United States and the rules and regulations applying thereto, shall continue to be subject to such location and entry, notwithstanding any provisions herein contained."

Miscellaneous.—The following general acts in addition to those already mentioned were passed at the special session:

To adopt regulations for preventing collisions upon certain harbors, rivers, and inland waters of the United States—a full code for inland navigation.

To authorize the President to suspend discriminating duties imposed on foreign vessels and commerce.

To give the consent of Congress to a compact entered into between the States of South Dakota and Nebraska respecting the boundary between said States.

Making an appropriation of \$250,000 to be immediately available, for the improvement of the Mississippi river from the head of the rapids to the mouth of the Ohio river, and to erect a dam

from the appropriation for the Mississippi river from the head of the passes to the mouth of the Ohio river, contained in the act "making appropriation for the construction, repair, and preservation of certain public works, and other purposes," which became a law on June 3, 1896.

To amend an act entitled "An Act to provide for the entry of lands in Greer County, Oklahoma, to give preference rights to settlers, and for other purposes," approved Jan. 18, 1897.

Appropriating \$50,000 for the relief of suffering American citizens in the island of Cuba.

Directing the Secretary of the Treasury to give an American register to the foreign-built steamships "Massapequa" and "Menantie," to enable them to carry grain under the American flag to the sufferers by famine in India.

Authorizing the Secretary of War to use rations for the relief of destitute persons in the district overflowed by the Rio Grande river at and near El Paso, Texas.

To amend section 8 of the act entitled "An Act providing a civil government for Alaska," approved May 17, 1884, to create the office of surveyor general for Alaska, and for other purposes.

Authorizing the Secretary of War to use rations for the relief of destitute persons in the district overflowed by the Mississippi river and its tributaries and by the Red River of the North, and making an appropriation to relieve the sufferers by said overflow.

Authorizing foreign exhibitors at the Transmississippi and International Exposition, to be held in the city of Omaha, in the State of Nebraska, during the year 1898, to bring to the United States foreign laborers from their countries, respectively, for the purpose of preparing for and making exhibits.

Appropriating \$50,000 for the expenses of the International Postal Congress.

Authorizing the construction of bridges over Pearl river in Mississippi, the St. Louis river between Minnesota and Wisconsin, and the Church river in Tennessee.

CONNECTICUT, a New England State, one of the original thirteen; ratified the national Constitution Jan. 9, 1788; area, 4,900 square miles. The population, according to each decennial census, was 237,946 in 1790; 251,002 in 1800; 261,942 in 1810; 275,148 in 1820; 297,675 in 1830; 309,978 in 1840; 370,792 in 1850; 460,147 in 1860; 537,454 in 1870; 622,700 in 1880; and 746,258 in 1890. Capital, Hartford.

Government.—The following were the State officers during the year: Governor, Lorrin A. Cooke; Lieutenant Governor, James D. Dewell; Secretary of State, Charles Phelps; Treasurer, Charles W. Grosvenor; Comptroller, Benjamin P. Mead—all Republicans; Supreme Court of Errors—Chief Justice, Charles B. Andrews, Republican; Associate Justices, David Torrance, Republican; Augustus H. Fenn, Democrat; Simeon E. Baldwin, Democrat; and William Hamersley, Democrat; Clerk, C. W. Johnson.

Finances.—The funded debt of the State was reported as: \$1,500,000 3-per-cent. bonds falling due Jan. 1, 1902, and \$1,740,000 3-per-cent. bonds due Oct. 1, 1910; total, \$3,240,000. The condition of the treasury was reported as follows at the beginning of the year: Cash on hand Sept. 30, 1894, \$738,418.07; received during year ending Sept. 30, 1895, \$1,997,016.35; received during year ending Sept. 30, 1896, \$2,117,819.27; total, \$4,853,253.69. Expenditures: For year ending Sept. 30, 1895, \$2,216,679.93; for 1896, \$2,345,839.91; total, \$4,562,519.84; leaving cash balance Oct. 1, 1896, \$290,733.85. Expenditures exceeded receipts in 1895, \$219,663.58; in 1896, \$228,020.64; showing a de-

crease of cash balance for two years, \$447,684.22. The judicial expenses for 1895 were \$369,362.51; for 1896, \$366,765.65. The Comptroller reported that during the past ten or twelve years the expenses of the State have increased very rapidly, and much more in proportion than the grand list and popula-

LORRIN A. COOKE, GOVERNOR OF CONNECTICUT.

tion. The average annual expenses for the four years ending 1882 were \$1,280,117.19; for the four years ending 1896 they were \$2,124,591.22, an increase of nearly 60 per cent.

Near the close of the year the Treasurer reported that the civil list showed a total of \$2,673,107.52, of which \$290,733.85 was the balance from Oct. 1, 1896. Of the receipts constituting the remainder the largest were: Interest of school fund (transferred to civil list fund March 1, 1897), \$112,523.08; military commutation tax, \$147,885.80; nonresidents' stock tax, \$104,149.49; tax on steam railroads, \$874,436.95; tax on street railroads, \$120,765.25; tax on savings banks, \$353,382.81; tax on mutual life insurance companies, \$267,670.71. Payments were made partly as follows: Civil-list orders, \$1,981,814.19; registered orders, \$460,734.06; interest on State bonds, \$104,700; the total of payments was \$2,550,080, leaving a balance to credit of the civil list, Oct. 1, 1897, of \$123,027—smaller by \$167,706 than that of a year previous. There was a decrease in revenue from the collateral-inheritance tax. In 1896 the income from this source was \$135,836, while in 1897 it was \$77,492—a decrease of \$58,344.

Banks.—The savings banks of the State were reported as nearly all in a healthy condition. The number is 89; number of depositors, 356,445; amount of deposits, including surplus, \$149,032,123; State tax, \$340,405. In his legislative message the Governor said: "The ever-increasing difficulties that savings-bank officers encounter in procuring investments that are sound and pay income indicate a possible, not distant, future when the rate per cent. declared as dividends to depositors will of necessity be reduced." The number of State banks is 8; total assets, \$8,356,515; total assets decreased

during the year, \$315,563.43. There was a gain in amount of surplus of \$85,209, and a decrease of \$54,793 in undivided profits, leaving the net gain \$30,416.

Number of trust companies, 12; total assets, \$7,522,380. Assets had decreased \$553,746, surplus had increased \$60,727, undivided profits decreased \$109,268, leaving net decrease \$48,540.

Insurance.—The condition of the insurance companies of the State for 1896 was reported as showing "no great changes, other than the healthy growth which good foundations, good management, conservative handling of investments, and the absence of any unusual losses always brings." The fire insurance stock companies had a paid-up capital, \$10,175,000; gross assets, \$36,003,325; increase in ten years, \$11,963,000; surplus over all liabilities, \$8,173,155. The mutual life insurance companies had: Assets, \$1,734,841; increase in ten years, \$339,544; surplus over all liabilities, \$1,345,393. The life insurance companies operating on fixed-premium plan had assets, \$136,329,480; increase in ten years, \$25,490,134; total liabilities, except capital, \$120,016,875; paid death and endowment claims during the year, \$9,381,719. Companies doing life insurance business on the assessment plan had total assets, \$9,289,812; paid claims during year, \$1,749,433. The estimated loss by fire in the State for the preceding year was \$1,840,000. Concerning assessment associations, Commissioner Betts said in his report: "The logic of events is gradually bringing this large and important system of insurance to a more definite and satisfactory recognition of its imperfections and their remedies. The old expedient of graded rates fixed at entry, to be called for as many times during each year as mortuary necessities required, adopted by the fraternal societies, is now admitted, almost unanimously, to be inadequate to stay the tide of a practically unlimited increase in the number of assessments as age advances."

Railroads.—The Railroad Commissioners reported for 1896: Capital stock of all steam railroads operating in the State, \$100,726,263; funded debt, \$43,660,000; total current liabilities, \$12,600,637; gross earnings, \$36,746,531; operating expenses, \$25,754,818; net earnings, \$10,993,778; dividends paid, \$4,561,966; taxes paid the State, \$756,066; number of passengers carried, 51,977,648; number of employees, 27,484; total amount of freight carried, 15,142,806 tons, an increase of 673,194 tons over previous year. The property accounts of the companies amounted to \$170,275,063.18, an increase during the year of \$3,195,605.13, and was apportioned as follows: Cost of roads, \$124,730,364.78; cost of equipment, \$10,632,020.59; bonds and stocks, \$17,314,037.67; other permanent investments, \$10,635,372.63; cash and cash assets, \$4,469,599.32; other assets, \$2,493,668.19. The total length of roads was given at 1,521.60 miles, or 1,980.23 miles of single track and 639.47 of sidings, making the total length of single tracks 2,619.70 miles.

Street Railways.—Twenty-seven street-railway companies reported, but 2 of them had not yet begun business. The reports gave figures as follows: Capital stock, \$9,221,740; funded debt, \$8,690,100; floating debt, \$849,255—total liabilities, \$18,761,095; cost of roads, \$16,338,223; cost of equipment, \$2,047,037; gross earnings, \$2,589,619; net earnings, \$884,894; number of passengers carried, 62,789,791.

Education.—There were reported 1,563 public schools and 3,436 departments, under 3,708 teachers, with accommodation for 148,000 scholars. The number of scholars on the registers was 141,485, and the average number in attendance was 96,925. The schools were open an average of one hundred and eighty-seven days in the year. The cost of the

schools was \$2,706,831. The towns and districts were taxed to the amount of \$1,088,770. The average cost for each child in attendance during the year was \$24.90. There was reported an average saving of every head of expense. The school fund, which entered upon its second century, was reported to have paid to the public schools a total of \$9,740,276.59 and the capital had risen from \$1,300,000 in 1867 to \$2,008,048 in 1896. From July 1, 1895, to Sept. 30, 1896, there were 334 applications for loans, of which 287 were granted, aggregating \$368,100. The revenue of the fund during the year ending Sept. 30, 1896, was \$127,734.48. The State has 3 normal schools for the training of teachers, and 67 towns have established high schools. The secretary of the Board of Education said in his report: "The question now is, whether it is not the duty of the State to compel all who begin the work of teaching hereafter to secure for themselves the training which will make them fit instructors of the young."

Agriculture, etc.—The report of the Board of Agriculture gives evidence that the farming and dairy industries are making great advances in scientific and practical knowledge of soil, crops, and domestic animals. The Storrs Agricultural College is in a prosperous condition, offering at small cost instruction in all the departments that pertain to rural life. A cottage for girls has been built, at a cost of \$12,000. An experiment station established at the school by the Legislature receives annually from the State \$7,500. The State also gives an annual appropriation of \$1,800 to this station for investigating food economy. The State Agricultural Experiment Station is at New Haven. Its work includes the inspection of commercial fertilizers, which prevents a fraudulent article being used in the State, analyzing butter and molasses for the State Dairy Commission, and field experiments to ascertain the effects of different fertilizers upon various crops. There are 60 creameries in the State, and the introduction of the system is reported to have greatly developed the dairy industry by putting upon the market butter of such excellent quality that the poorer grades can not longer find sale, except at very low and unremunerative prices. The most important duty of the office of Dairy Commissioner is to enforce the law relating to the sale of imitation butter.

Charitable and Penal Institutions.—There are 168 institutions maintained in the State for the care of its defective and dependent classes. The amount paid by the State for the support of these institutions during the year ending Sept. 30, 1896, was \$692,329. The Industrial School for Girls, founded by gifts from charitable persons, for the care and instruction of girls without homes or whose surroundings were evil, reported: Whole number of girls received since opening the school (1870), 1,257; under care during last two years, 469; paid by the State, 1896, \$40,784. Ninety per cent. of the girls who have gone out of the school are said to be leading pure and useful lives. The School for Boys reported the number received for the year ending Sept. 30, 1896, at 190; number returned on old commitments, 68; whole number in school, 469; money received from the State during the year, \$79,087. Since the opening of the school (1854) there had been received 5,815 boys.

The trustees of the State Hospital for the Insane reported that the north hospital, which the General Assembly had authorized, had been completed and furnished at a cost of \$101,786. The whole number of insane persons under care of the State was 1,782.

At the Industrial Home for the Blind, 100 children were trained and educated during the year.

The number of convicts in the State Prison was

285. Improvements on the prison to the amount of \$20,000 had been made.

Labor Bureau.—The report of this bureau was largely devoted to the subject of taxation and to the irregular methods in valuations of property which prevail in the towns. The total number of manufacturing establishments reporting in the State was 789, having 83,051 employees. The average weekly hours of labor for the whole number of establishments and employees during the year was 53.79, exclusive of hours lost by the employees by reason of days closed. The proportion of business done as reported by the manufacturers as being the proportion of actual or full capacity of the whole number of establishments reporting was 79.69 per cent. The amount paid in wages by the 789 establishments reporting was \$38,509,484 for the year. If the number of employees reported was the true average for the year, the yearly wage rate for all industries was \$463.68 per employee.

Factory Inspection.—The report of the Inspector of Factories showed: Total number of factories inspected, 1,461; number of male employees, 96,225; number of female employees, 39,684; total number of employees, 135,909; factories in which no changes were ordered, 1,002; factories in which changes were ordered, 459; number of changes ordered, 769; number of factories with improper means of egress where proper authorities were notified, 28; number of fatal accidents during the year reported from different sources, 19.

Militia.—The Connecticut National Guard, under the command of Brig.-Gen. George Haven, consists of 205 commissioned officers and 2,678 enlisted men. The Governor's Guard is composed of 25 commissioned officers and 373 enlisted men. Total expenses of the National Guard for the year ending Sept. 30, 1896, \$140,847; of the Governor's Guard, \$14,370. The Naval Battalion had 17 commissioned officers and 149 men.

The number of inmates borne on the rolls of the Soldiers' Home, at Norton, was 454, being an increase of 100 over the preceding year; total expenses, \$74,700.

Fish and Game.—With the present shad-hatching facilities the commissioners are able to turn into the Connecticut river each October from 6,000,000 to 8,000,000 shad from 3 to 5 inches long. The United States Fish Commission gave to the State 3 ear loads of cans of shad fry and 50,000 salmon eggs, which were placed in a retaining pond at Poquonock for release into Farmington river. The catch of shad in 1896 numbered 57,318. The commissioners have co-operated with the United States commission in lobster hatching, and an egg-taking station was established at New London.

There are very few wild deer now in the State, and there is a fine of \$100 for killing one at any season.

The oyster business of the State is reported as growing rapidly, the foreign trade having become very great. Practically all the oysters are shipped to England, where a large proportion are transplanted, to be used as required. It is stated that none but Connecticut oysters are sent to Europe from the United States. One firm, of South Norwalk, claiming to be the largest oyster-exporting house in the country, sent to England 40,000 barrels of oysters in 1896.

Good Roads.—A law passed at the preceding session of the General Assembly apportioned the expense incurred in the construction of improved roads, one third to be paid by the State, one third by the county in which is located the town having road improvement, and the remaining one third to be paid by the town. The law limits the amount to be taken from the State treasury to \$75,000 an-

nually. Eighty towns applied for aid under the law in 1895, and 86 towns took advantage of the law for building better roads in 1896. For this enterprise the State has paid \$146,863; counties have paid the same; towns have paid \$515,279.

Liquor License.—There has been an increase in the number of license towns. Returns from the entire State, including New Haven and the five other places at which elections are held at other times than in October, show a total of 80 licensed towns against 71 in 1896. The license vote of increase is said to be due in some cases to the dislike of the agitation and expense of the preceding year for liquor raids, and in some others to objection to the new law under which licenses may no longer be granted to druggists to sell in no-license towns, even on prescriptions. The unusually light vote of the women was said to be owing to the new law, which requires that they shall vote as men do. This is somewhat more troublesome than the old requirement of simply registering with the town clerk.

Sunday Closing.—A new Sunday-closing law that went into operation in July reads in part: "Every person who shall do any secular business or labor, except works of necessity or mercy, or keep open any shop, warehouse, or manufacturing or mechanical establishments, or expose any property for sale, or engage in any sport, between 12 o'clock Saturday night and 12 o'clock Sunday night, shall be fined not more than \$50."

New Legislation.—Some abstracts of new legislation by the General Assembly of 1897 are here given:

Creating the office of Attorney-General, to be elected by the people in November, 1898, he and his successors to be elected for four-year terms.

Prescribing a State flag with a blue ground on which is a shield bordered in silver and gold, bearing the three grapevines on a white ground. Beneath is a streamer of white bordered with gold and brown, with the State motto, "*Qui Transtulit Sustinet*," in deep-blue letters.

That no bill or resolution affecting private interests only shall be introduced in the General Assembly until there has been paid to the State Treasurer a fee of \$5 for each legal page (280 words). If it becomes a law the money shall be retained by the State, if not the fee shall be returned. Corporations having capital stock shall pay an additional fee of \$1 for each \$1,000 of stock, and a like fee on any amendment increasing the stock.

That if the guest of a hotel delivers his valuables for safe keeping, the proprietor shall not be responsible for loss beyond \$300, unless otherwise agreed in writing. He shall not be liable for loss of chattels unless they are in the guest's room or checked.

That if selectmen willfully neglect to provide a flag for a schoolhouse, under the act of 1893, or to renew the flag when necessary, after thirty days' notice, they shall forfeit \$10; half to the town and the remainder to the person who shall sue therefor.

That any person willfully or maliciously injuring a bicycle path shall be fined not exceeding \$50, or imprisoned not over three months, or both.

That if any bicycle rider on the highway runs against any person and injures him, and does not stop, render aid, and give his name and residence, he may be arrested and fined up to \$500 or imprisoned not exceeding six months.

That debts for personal wages, due for labor within three months, up to \$100, shall be preferred claims against any corporation or firm for which a receiver may be appointed.

Allowing the establishment of crematories and regulating them.

Providing that the constitutional amendment that "every person shall be able to read in the Eng-

lish language any article of the Constitution or any section of the statutes of this State before being admitted an elector," shall be submitted to the people at the October election, 1897. At the October election this amendment was adopted.

COREA. See KOREA.

COSTA RICA, a republic in Central America. The Congress is a single chamber of 21 Representatives, elected for four years by electoral colleges composed of delegates chosen by all respectable citizens. Half the Representatives retire and are replaced by fresh elections every two years. The President is elected by the same indirect method for the term of four years. The President for the term ending May 8, 1898, is Rafael Iglesias. The Cabinet at the beginning of 1897 was composed as follows: Foreign Affairs, Worship, Public Instruction, Benevolence, and Justice and Minister of Finance, Ricardo Montenegro; Gobernacion, Dr. Juan J. Ulloa; War and Marine, Juan Bautista Quiroz. The Vice-Presidents of the republic were José Joaquín Rodríguez, Dr. Carlos Durán, and Ascension Esquivel.

Area and Population.—The area of Costa Rica is estimated at 23,000 square miles. The population in 1892 was 243,305, besides 3,500 Indians and 10,456 estimated to have been left out of the census. There were 6,289 foreigners, of whom 831 were Spanish, 622 Italian, 342 German, 246 English, 204 American, and 634 British West Indian. There were 1,490 marriages, 10,567 births, and 6,027 deaths recorded in 1893; immigration in 1891, 6,330; emigration, 3,706. San José, the capital, has about 20,000 inhabitants. Education is free and compulsory. There were 267 elementary schools in 1892, with 11,472 pupils. The sum expended by the Government on education was 546,000 pesos in 1891.

Finances.—The revenue in 1896 was 6,528,975 pesos; expenditure, 6,187,927 pesos. The military force of the republic is 600 regular soldiers and 12,000 militia, which in case of war can be increased to 34,000. A loan of £1,000,000 was raised in England in 1871, and one of £2,400,000 was issued at the price of 82 in 1872. These sums were raised for a railroad that the foreign contractors afterward failed to complete. The unpaid principal amounted in 1887 to £2,691,300. This was converted into a new debt of £2,000,000 bearing 5 per cent. interest, while for the arrears of interest, then amounting to £2,119,512, shares of the Costa Rica Railroad were given at the rate of 22½ per cent. of the full amount owing. In 1895 the Government defaulted on the new debt, and negotiations were opened with the English creditors for a new settlement. The internal debt amounted to 1,381,591 pesos on March 31, 1896. In 1894 the Costa Rican Government informed the English creditors that owing to the decline in silver it could not fulfill its existing obligations by paying gold, and it therefore proposed that the debt should be reduced to 50 per cent., on which 4 per cent. interest should be paid. The bondholders would not agree to this, but offered to consent to a temporary reduction of the rate of interest. In 1897 an arrangement was finally made reducing the annual interest charge on the foreign debt to nearly half, or from £100,000 to £55,000.

Commerce and Production.—The principal exportable products are coffee and bananas. The coffee of Costa Rica is sought after in the European markets, and is mainly exported to Hamburg. Corn, rice, wheat, and potatoes are raised for home consumption. The soil is so fertile and the climate at different elevations so various that almost any products of the tropical and temperate zones can be raised. The live stock in 1892 comprised 77,043 horses, 345,665 cattle, and 2,765 sheep. The coffee export in 1895 was 188,766 bags, valued at 11,200,283 pesos. The

export of bananas was 784,257 pesos in value. Other exports are cabinet woods, cedar, and hides and skins. The total value of imports in 1895 was 13,250,000 pesos, against 10,165,291 pesos in 1894; of the exports, 14,509,440 pesos, against 12,783,009 pesos. Of the imports in 1894 Great Britain supplied 32 per cent., and in 1895 28 per cent. while the United States supplied 35 per cent. in 1894 and the same proportion in 1895, and Germany 19 per cent. in 1894 and 21 per cent. in 1895.

Navigation.—There were 458 vessels, of 427,674 tons, entered during 1895 at the ports of Limón and Punta Arenas, and 450, of 432,770 tons, cleared. The merchant marine of Costa Rica in 1893 consisted of 1 sailing vessel, of 318 tons, and 2 steamers, of 528 tons.

Communications.—The railroad from Limón to Alajuela is 147 miles long. Of the railroad building from Punta Arenas, on the Pacific coast, to meet it, 14 miles have been completed. Other lines are projected. The railroad receipts in 1895 were 2,449,803 pesos.

The post office in 1893 forwarded 791,591 internal and 865,275 foreign letters. The telegraphs belonging to the Government have a length of 630 miles. The number of dispatches in 1891 was 222,231.

Politics and Legislation.—The national Congress opened its regular session on May 1. The public finances were declared to be satisfactory, the revenue for the fiscal year 1896-97 having been \$7,435,610, exceeding that of the preceding year by \$851,102 and the estimates by \$538,226. The expenditures had amounted to \$6,697,326, leaving a surplus of \$738,284, which, added to the balance of the previous year and export duties on coffee not yet collected, left \$1,270,000 in the treasury on March 31, 1897. In accordance with the boundary convention with Nicaragua, arranged through the mediation of Salvador, the President of the United States, on Feb. 17, selected E. P. Alexander to accompany the boundary commissioners of the two countries and decide whatever questions may arise between them in their work of establishing the boundary. Before a final settlement of the boundary was arrived at, the Costa Rican Congress revived the quarrel and angered the Nicaraguans by passing a bill early in July, declaring the San Juan river free to the navigation and commerce of all nations. The Nicaraguan Government made a vigorous protest, and was supported by the Central American Federal Diet. The boundary commission suspended work pending the settlement of this new dispute. Political excitement reached a high pitch as the presidential election approached, and after some signs of disturbance appeared and several arrests had been made, the right of *habeas corpus* was suspended for sixty days from Sept. 15. Within a few weeks some hundreds of suspected revolutionists were placed under arrest. Ex-President Mora, who was believed to be the candidate of the Opposition party for President, was exiled.

CRETE, an island in the Mediterranean Sea possessing autonomous institutions under the suzerainty of Turkey. The island, which lies southeast of Greece, is 30 miles in extreme width and 156 miles long. The seat of government is Candia, which has a population of 14,610, of whom 4,750 are Greek Orthodox, 9,500 Mohammedans, 200 Roman Catholics, and 160 Israelites. The foreign consuls reside at the neighboring town of Halepa. Candia, with a population of 13,000 Turks and 6,000 Greeks, and Retimo, with 6,321 Turks and 1,329 Greeks, have smaller harbors than that of Candia, but the fortified harbor of Suda, where is the Mediterranean navy yard of Turkey, is one of the largest and safest in the Levant. A third of the area of the island con-

sists of barren mountain, a third is tillable land that remains uncultivated, and a third is cultivated rudely, but produces superior olives and other fruits, for which Crete has been celebrated from ancient times. Orchards of orange, lemon, citron, and almond trees abound in the valleys. Olive oil and olives are the chief exports. Grapes of many varieties are grown, and raisins and wine are important products.

The untrustworthy census taken in 1881 by order of Photiades Pasha gave a total population of 279,165, of whom 205,010 were Orthodox Greeks, 73,234 Mohammedans, 647 Israelites, 253 Roman Catholics, 13 Protestants, and 8 Armenians. The present population includes about 200,000 Christians and 110,000 Mohammedans. All except a few Arabs and Africans and other foreigners in the coast towns are of the Greek race. The Mohammedan Cretans are descendants of those Greeks who embraced Islam when the island was conquered from the Venetians in 1669 and were rewarded with lands and made the ruling and military class. Some of the Cretan boys are still large landowners. There are also many small proprietors among the Mussulmans who are frugal and industrious olive growers. Owing to the spread of education among the Christians these have outstripped the Moslems in trade, industry, and professional pursuits within the period since all have stood on the same civil and political footing, and the latter feel sore over the loss of their predominance and prestige and the reversal of their ancient relations to the Christians.

Crete revolted with the other Greek islands in 1821, but was restored to Turkey in 1830 by the Treaty of London. In 1866 there was a formidable uprising that lasted two years, the suppression of which cost the Turkish treasury over \$30,000,000, and which resulted in the granting in 1868 of a new organic law promising liberal concessions to the Christians. In the Treaty of Berlin the Porte undertook to apply this organic law, which till then had remained nugatory, reserving the right to introduce modifications. The delay in the execution of this clause led to another insurrection. The Porte sent Mukhtar Pasha, with power to grant certain privileges in pursuance of the law. Negotiations between the Turkish commissioner and delegates of the Christians resulted in the pact of Halepa, signed Oct. 15, 1878, by the terms of which the Governor was to be a Christian and the island was endowed with a limited degree of autonomy. Fresh uprisings took place, in consequence of which the pact of Halepa was suspended in 1889.

The Cretan Constitution was very liberal in its provisions. There was a General Assembly, which met every year, and which was elected by the whole population. The imposts and duties were carefully limited, and the expenditure was under popular control. There was a Christian governor for every Christian district, assisted by a council of Christians, and for every Mussulman district there was a Mussulman governor, with whom was associated a Christian deputy governor as *condjutor*. There was also a *gendarmierie* supposed to be recruited from Christians and Mussulmans indifferently. This Constitution was safeguarded by the absolute liberty of the press and of discussion.

The Plan of Reforms.—During the Cretan insurrection of 1896 the six great powers—England, Austria-Hungary, France, Germany, Italy, and Russia—recommended to the Sultan and he adopted a scheme of reforms based on the demands of the Christian Deputies of the Cretan Assembly. The scheme provided for a Christian governor general to be appointed for five years by the Sultan with the consent of the powers; the governor general to have the right of veto on all laws voted by the Assembly except such as introduce modifications of

the pact of Halepa, and to appoint all secondary officials, the higher posts to be filled by the Sultan, Christians to have two thirds and Mohammedans one third of the offices; elections to the Assembly and the sessions of that body to be held biennially, instead of annually; the Assembly to vote the biennial budget, control accounts, and vote bills submitted by the governor general or by Deputies by an absolute majority, save bills modifying the laws in force and requiring under the Halepa convention a two-third majority, no proposal involving an increase in the expenditure to be discussed unless introduced by the governor general or the competent department; the provisions of the firman of 1887 assigning to Crete half the customs revenue to be again put into force, and the Cretans to acquire a right to the revenue from imported tobacco; a commission comprising European officers to reorganize the *gendarmierie*; another commission comprising European lawyers to study the reform of the administration of justice, rights arising out of the capitulations being reserved; no law to be put into force unless voted by the Assembly; the publication of books and newspapers, the establishment of printing presses, and the foundation of scientific societies to be subject to the authorization of the governor general in accordance with the law; no native of Cyrene to be allowed to emigrate and settle in the island without the authority of the governor; and the General Assembly to be convened within six months, and elections ordered in accordance with the law of 1888, the governor general conjointly with the Administrative Council regulating in the meantime the execution of the reforms by means of provisional ordinances.

The ambassadors at Constantinople, who drew up this scheme of reforms, recommended a customs surtax to raise money to pay indemnities for losses sustained during the insurrection, the payment to be supervised by the consuls. While these reforms, which were intended to establish friendly relations between the two sections of the population, were being considered by the ambassadors and the Sultan, the state of affairs in the island became more and more unsatisfactory, and the Greeks of the Hellenic kingdom fomented the agitation. To prevent further disturbance from this quarter several powers considered it necessary to take measures against Greece. On July 27, 1896, the Austrian ambassador at London proposed to Lord Salisbury that the powers press the Greek Government to prevent the dispatch of volunteers, arms, and munitions from Greece to Crete, and in case the Greek Government should declare its inability to prevent arms and men from being sent to the insurgents, that the signatory powers should agree to institute a blockade of the Cretan coast.

Count Goluchowsky wished the powers also to intimate their intention to "restore to the Sultan his liberty of action" if the existing situation continued, and to state plainly that the responsibility for the consequences would rest with those who have hampered the efforts of Europe for the restoration of peace. To these proposals Lord Salisbury refused to accede, the reason alleged being that to take part in such a blockade would place Great Britain in the position of an ally of the Sultan in the task of repressing the insurrection of his Christian subjects. Owing to the opposition of Great Britain the idea of a blockade was given up, and new efforts were made to obtain the Sultan's sanction to the proposed reforms, which was obtained in August, and early in September the Christian and the Mohammedan Deputies in Crete accepted the scheme in behalf of their respective parties.

Renewal of Disturbances.—Though the settlement of the Cretan difficulty proposed by the pow-

ers in the summer of 1896 was finally accepted by the Porte and by the Cretan Deputies representing the Christians and the representatives of the Mohammedan community, the followers of the insurgent chiefs in the remote mountain districts still preserved their revolutionary organization. This, however, dwindled to an insignificant band, and acts of terrorism and retaliation ceased toward the end of the year. The population rested expectantly, waiting for the powers to carry into effect the agreement wrested from the Porte, and to organize an impartial constabulary force for the protection of Christians and Moslems alike. For a long time no steps were taken to organize the gendarmerie, as no fund existed as yet for the payment of its expenses. The absence of any efficient force for the preservation of order and the delay and inaction of the powers, to whom the Ottoman authorities had resigned the task of preserving the peace, afforded an opportunity to the turbulent elements on both sides. The Greek Government had fallen entirely under the influence of the patriotic societies that sought the annexation of Crete and the acquisition of Thessaly, and the Chamber at Athens voted large sums for military preparations. The nucleus of the revolutionary Government was preserved in the mountainous districts.

Early in January, 1897, disturbances broke out afresh in the vicinity of Canea. Georgi Berovich Pasha, the Vali of Crete, addressed a note to the consuls, pointing out the insufficiency of the gendarmerie, and Tewfik Pasha, the Turkish Minister of Foreign Affairs, requested that instructions should be sent to the consuls to exercise their influence to calm the public mind. Bands of Christians attacked Mohammedan villagers and threatened Canea, where during several days a panic prevailed. The Vali, aided by the Greek consul general, M. Gennadius, succeeded finally in appeasing the Christians for the moment.

The recrudescence of disorder stimulated the European military commission that was studying the problem of a new gendarmerie. The Austrian ambassador, on Jan. 12, 1897, presented to the Porte the scheme devised by this commission, and after first objecting to the enrollment of foreigners in the new gendarmerie, the Porte, on Jan. 14, signified the acceptance of the plan recommended by all the ambassadors.

In the meantime fresh murders and reprisals kindled again the religious feud. The Christians, especially in the Kisamo district, attacked the Mohammedan peasants, and the latter abandoned their homes and fled to the fortified towns. The influx of these refugees alarmed in turn the Christian families of Canea and Heraklion, where those possessing the means prepared to remove to Athens. Major Bor, formerly commandant of gendarmes in Cyprus, was nominated by the European commission to be colonel of the new gendarmerie, and was finally accepted by the powers, though at first M. de Nelidoff, in behalf of Russia, objected to the appointment of an officer of the British army. A loan of £100,000 obtained in Paris removed the chief impediment to the realization of the new reforms, but the annexation movement had now gone too far in Greece, and the Cretan Christians were now wholly under the influence of the Ethnike Hetairia, the secret Greek patriotic society, which before the end of January sent bands of filibusters over the Macedonian border to threaten Ottoman rule on the mainland also. Armed bands of Christians numbering nearly 3,000 men in the vicinity of Canea attacked and burned Taratzo and two or three other Mohammedan villages, while bands of Mohammedans made forays from the city and burned Galata, and on Feb. 2 Murnies

and Tsikalaria. Many persons were murdered. The foreign fleet left Suda Bay and anchored off Canea. Another uprising of Christians took place in the neighborhood of Retimo, where Mohammedan villages were blockaded, and disorder reigned to such an extent that the governor informed the consular body that he had not the power to preserve the peace. A committee of notables of both creeds vainly begged the Christian insurgents to withdraw. While the Vali and the consuls went through the country endeavoring to prevent more serious catastrophes the European powers dispatched more war ships to Cretan waters. Major Bor organized two or three companies of gendarmes recruited in Montenegro, but it was too late for this puny force to accomplish anything. The Vali was reluctant to employ the military forces, lest any conflict between the troops and the Christians should lead to a general insurrection.

Greek Intervention.—On Feb. 4 serious fighting occurred between the Christian and Mohammedan population in Canea. About 30 people were killed. Incendiary fires were kindled in many places, and one whole quarter of the town was destroyed. The Christian families went on board the ships in the harbor, while sailors and marines landed with pumps to extinguish the flames, in which work the inhabitants of both parties aided, when order and tranquillity had been restored, after two days of fighting. At Halepa, a few miles away, 700 armed Christians were confronted by a body of Mohammedans, also armed. The Greek and Cretan refugees from Canea to the number of 1,000 were conveyed on a cruiser to Syra. The situation at Retimo and Heraklion was likewise so serious that the consuls asked for the protection of men-of-war. At Retimo were congregated most of the Mohammedans from the provinces of Retimo, Hagios Vasilios, and Mylopotamos, who had forced their way into the town. Others laid siege to the Christian villages of the Retimo province. In the district of Heraklion it was the Mohammedans who were blockaded in their villages, while their coreligionists of the town called upon the *mutesarrif* to effect their instant release if he would not have them take up arms and march out to free their brothers.

On Feb. 7 the insurgent body at Halepa proclaimed the union of Greece and Crete. The Greek squadron arrived in time to take off the last of the refugees from Canea. The powers had raised no objections to the sending of Greek war vessels to Crete, such as they had interposed in May of the preceding year. When the ships arrived and omitted to salute the Turkish flag, according to custom, the senior officer of the British squadron paid a visit to the Greek commander and induced him to exchange salutes with the fortress. Prince Georgios, of Greece, assumed command of the torpedo flotilla of eight boats that was about to be dispatched to Crete by the Greek Government with the avowed purpose of preventing the landing of Turkish troops. The powers had unitedly notified Greece before the dispatch of her war vessels that she would not be allowed to interfere on the island, besides averting the chance of collision by preventing the Porte from sending fresh troops. By Feb. 12 the insurgent body concentrated before Canea numbered 12,000. Arms and ammunition had been landed at Sphakia, on the south coast near the western extremity of the island, by expeditions from Greece. After a prolonged fight, the Mohammedans were driven into Canea, and the Christians made ready to attack the town. A Turkish transport that sailed with reinforcements from Heraklion was put back by one of the Greek war ships and put back. On Feb. 13 the insurgents, joined by volunteers from Greece, assembled in great force on the peninsula of Akro-

tion, and, displaying the Hellenic flag, advanced upon the Turkish fort at Canea. The Turks, under cover of the guns of the fortress, made a sortie, and after being driven back, sallied forth again 1,700 strong, after nightfall, retiring finally into the fortress, after desperate fighting, in which the losses were heavy on both sides.

The fighting at Canea caused the wildest excitement at Athens, and impelled the Hellenic Government to send war ships to Crete, while the Chamber and the populace enthusiastically acclaimed the union of Crete and Greece. In all, 5,000 Cretans had escaped on foreign war vessels to Milo, to be thence distributed by Greek steamers to the Piræus, Syra, and various Greek islands. The Cretans resident in Greece urged union with Greece as the only solution possible after the signal failure of the plan of reforms elaborated and applied under the direct supervision of the powers. The *Ethniké Hetairia*, the secret organization that has collected funds for the furtherance of Panhellenic aspirations from the Greek colonies in all countries, and had now worked up the Cretan and Macedonian agitation to such a pitch that not even the King would dare to stem the tide of popular feeling, published an address to the Cretans proclaiming the union of Greece.

As the ironclad "Hydra," the cruiser "Mykale," and the gunboat "Alpheios" sailed away for Crete, and the "Spetsai" and "Psara," the cruiser "Miaoulis," and several torpedo boats were got ready for sea, the Greek Minister of Foreign Affairs called upon the representatives of the powers at Athens to assure them that the concentration of Greek war ships in Cretan waters was not intended as a hostile demonstration against Turkey, but merely as a measure for the protection of the numerous Greek subjects in Crete and for the rescue of Cretan fugitives. When the Turkish Government proposed to strengthen the garrisons in Crete, the ambassadors expressed strong disapproval of such a course, urging that any intervention of the troops or the arrival of re-enforcements would only increase the excitement of the Christians and render the situation extremely dangerous. The Greek Government was at this time rapidly summoning the reserves to the military depots and making large purchases of arms abroad. The Greek Premier made reply that the Hellenic Government, having full knowledge of the situation, did not hesitate to assume the whole responsibility for the measures it had taken.

Foreign Occupation.—The German Government considered that this unqualified defiance of the will of Europe precluded further diplomatic steps at Athens. On Feb. 13 Greek troops, after being reviewed by the Crown Prince, embarked at the Piræus on Feb. 14, and set sail for Crete. The ambassadors at Constantinople agreed to the British proposal not only to deter both the Greeks and the Turks from landing troops or using their naval forces to assist either of the contending factions on the island, but also to occupy jointly in the name of all the powers the ports of Canea, Retimo, and Heraklion. Accordingly 450 bluejackets were landed from Austrian, British, French, Italian, and Russian ships at Canea. Another detachment was debarked at Sitia on Feb. 15. By this act the powers assumed the responsibility for the restoration and maintenance of order in Crete. Mushavir Ismail Bey, to whom Georgi Berovich Pasha had delegated the powers of administration, addressed a note to the foreign commanders, gladly accepting the foreign occupation, and requesting that it be extended to Kisamo, Selino, and other towns.

The Greek corps of occupation, consisting of 2,000 infantry, artillery, and engineers, commanded by Col. Vassos, chief aid-de-camp to King Georgios, effected a landing at Platania, nine miles west of

Canea. The British, Italian, and Russian consuls went to Selino, where massacres were occurring in the villages, 104 Mussulman men, women, and children having been murdered in Barakina alone. They were unable to enter into negotiations with the belligerents, who appeared determined to fight to the bitter end. Both sides had massacred their prisoners. The Christians at Candano fired upon the consuls, though they were known and bore a flag of truce. At Serakimos 100 were massacred, including 20 women and 61 children, and an equal number in the surrounding villages. Near Sitia, in the eastern extremity of the island, 1,147 men, women, and children, almost the entire population of nine villages, had been slaughtered, only about 100 Moslems escaping. The villagers had been induced to lay down their arms by the Christians, who promised them a safe escort to Sitia. The life of no Moslem was safe outside of the cities. Eight villages were surrounded by the insurgents. The Mohammedan villagers in the neighborhood of Hierapetra were given a safe conduct into the town through the intervention of the bishop, but when they arrived there they seized 150 Christians and detained them as hostages. The fort at Bukolies, garrisoned by 500 Turkish troops, underwent a long siege by a large force of well-armed insurgents. Col. Vassos on Feb. 16 captured the Turkish fort at Aghia, taking 400 prisoners. With the aid of the regulars the insurgents mounted guns on the heights of Akrotiri, and prepared to attack the city of Canea. According to Turkish official reports, 25 villages had already been pillaged and burned, and more than 27,000 Moslems had been killed. After the precipitate departure of Georgi Berovich Pasha the duties of his office were provisionally intrusted to Photiades Pasha, who received the offer of a definitive appointment as Vali of Crete, but at first declined. Karatheodory Pasha was then asked to go to Crete as the Sultan's High Commissioner, and he also declined, after which Photiades Pasha was again offered the governor-generalship, and finally accepted.

On Feb. 15 the Greek Minister of War issued an order appointing Col. Vassos to the command of the troops sent to Crete. This document set forth that the Greek Government, in consequence of the state of anarchy prevailing in Crete, had decided to dispatch an army corps to occupy the island and restore peace and order. The Greek Government on the same day communicated to the powers its absolute decision to persist in the occupation of Crete and the protection of the Cretans, who had declared that they were prepared to shed their last drop of blood for the fulfillment of their national aspirations. Col. Vassos issued a proclamation to the people of the island stating that they were suffering from the existing state of anarchy and the excesses of a fanatical populace, and that therefore the King of Greece had decided to put an end to this state of things by a military occupation of the island. Col. Vassos promised to respect the honor, life, property, and religious convictions of all the inhabitants, to whom he was bringing peace and legality. When the Greek consul at Canea raised the Hellenic flag the naval commanders of the powers, whose flags were flying over the town in token of the occupation in which Greece had no share, ordered him to lower the flag. The Greek guard was likewise removed from the consulate at their command, against the protest of the consul, who closed the consulate a few days later and joined Col. Vassos in the interior, first communicating to the various consuls the intelligence that all the provinces of Crete had voted in favor of union with Greece.

On Feb. 18 M. Skouses, the Greek Minister of Foreign Affairs, replied to the demand of the pow-

ers that the Greek flotilla in Cretan waters be withdrawn at once in an identical note, saying that the withdrawal of the flotilla would be impossible until Crete was completely pacified, and furthermore that the Greek Government would not rescind its orders to the Greek troops in Crete to oppose the landing of Turkish forces upon the island. Col. Vassos established his headquarters at Gonia and made preparations to attack Selino. He began to organize local administrations in the name of the King of the Hellenes and arranged for the holding of municipal elections. The insurgent forces, which soon numbered 20,000 men, were assiduously trained, furnished with arms, and formed into battalions under the command of Greek officers. A second body of Greek troops landed at Platania on Feb. 17 and another regiment a day or two later. One expedition was intercepted by a British cruiser and prevented from landing. An English war ship stopped a Greek vessel conveying arms for the insurgents and another prevented the landing of provisions, arousing great indignation in Greece. Admiral Canevaro informed the Greek consul that any attack of the Greek forces upon Canea, Retimo, Sitia, or Heraklion would be repelled by the naval forces of the powers. The same note contained a warning against any further hostile action on the part of Christian insurgents or Greek troops in other parts of the island. While the Greek troops were capturing important positions and Col. Vassos was arming the insurgents the great powers could not agree on any plan for restraining Greek intervention or holding in check the Hellenic Government, bent on defying Turkey and provoking war in spite of their warnings. Germany proposed a blockade of the Piræus, but to this Great Britain and Italy refused to give their consent before the question of the future of Crete was settled. France, too, wished to exhaust all means of conciliation before consenting to extreme measures. Austria supported the German proposition. Russia was willing to bring about the forcible expulsion of the Greek flotilla from Cretan waters, the disarmament of the Greek troops in Crete, and the blockade of the whole coast of Greece if the Hellenic Government persisted in its defiant attitude. The powers were agreed that if Greece went to war with Turkey she would be left to fight her battles alone. Lord Salisbury notified the European cabinets that Great Britain would never consent to any plan that contemplated the return of Crete to any form of Turkish control. The German Government was equally firm in refusing to consider any settlement of the Cretan question that did not first compel the evacuation of the island by Greece. The British and Italian premiers recommended that the powers should agree to grant autonomy to Crete upon lines similar to those upon which autonomy was given to the island of Samos, the *status quo* to be preserved meanwhile. The French Government agreed to the British proposal, which Germany did not absolutely condemn, though stipulating for the maintenance of the Sultan's supremacy. Premier Delvannis, who said that he had sought in vain to discover the reason for the action of the powers in opposing the Cretan operations of Greece, declared to the Boule, on Feb. 18, that Greece would persist in her course of action in Crète. The German Emperor declared to the French ambassador in Berlin on Feb. 14 that Europe could not allow Crete to kindle a fire in Macedonia and provoke a European war, and that the only effective remedy was to blockade the Piræus; that, having prevented Turkey from sending troops to Crete, it would be treacherous for the powers to allow the Greeks to take the island. Austria was willing to accept the proposal, but Lord Salisbury considered it premature, and M.

Hanotaux could not decide between it and the English proposal that Crete should be made a privileged province. Shortly afterward Germany isolated herself entirely from the rest of the powers, taking no part in subsequent discussions, sending tardily a war vessel to Crete, but abstaining from all part in the military occupation.

The commanders of the foreign war ships dispatched officers to the insurgent camp at Akrotiri and to the Greek commander to inform them that the powers had taken measures to prevent Greek interference. The insurgent leader replied that he would for the present maintain his position, and Col. Vassos returned answer that he had orders from his Government to occupy Crete and would do so. At the same time an *ultimatum* was addressed to the Greek commodore, whose fleet was drawn up outside of the squadron of foreign war ships that formed a cordon around the harbor. Great Britain had 10 war ships—4 battle ships, 2 gunboats, and 4 torpedo-boat destroyers—off Canea, besides a battle ship and 3 cruisers at other points on the coast. Italy was represented by 4 battle ships, a cruiser, and a gunboat; Russia by 3 battle ships and a cruiser; France by a battle ship and 2 cruisers; Austria by a battle ship; and Germany had a first-class battle ship on the way. Vice-Admiral Canevaro, of the Italian navy, as senior admiral of the united fleet, was chosen commander of the combined naval forces.

Two of the Greek ships went to Retimo, where the Mohammedans refused to allow Christian refugees to leave, wishing to detain them as hostages for the safety of the peasants besieged in the district of Amari. The Christians had now risen all over the island, and the Turkish garrisons held no territory except the coast towns and the isolated posts in the interior where they were invested by the insurgents. The station at Suda was abandoned. At Kiamo Kasteli the Mohammedan inhabitants were besieged in their houses after a fight in the streets on Feb. 7, in which 22 of them were killed. In a Turkish blockhouse in the Alikianu district the garrison were reduced to the last extremity. In the neighborhood of Sitia several villages were surrounded by insurgents, and the town itself was besieged. Subsequently 13 villages were destroyed by fire and many Moslems slain. A detachment of troops from Heraklion was embarked for the succor of this place, but at the request of the consular body it was recalled. At Heraklion the Mohammedans broke open and pillaged Christian houses. Cretan and foreign refugees were fired upon when they attempted to escape by sea. In this district 300 Mohammedans had been slain by Christians. In the eastern part of the island a body of 1,500 insurgents blockaded the Mohammedan villages. The Christian Governor General wished to resign, but the Porte was desirous of having him remain in his place. Nevertheless he left Crete on Feb. 14, having previously taken refuge on a foreign war ship.

Parties of Greek volunteers, including officers of the army, were surreptitiously landed with arms and ammunition from the Greek vessels about 10 miles from Canea. The French minister at Athens presented to M. Delvannis the formal protest of the powers against the action that Greece had taken in Crete, and intimated that they would take decisive steps to prevent further hostile proceedings. The ministers unanimously advised the recall of the Greek flotilla, promising that the powers would take into consideration the claims of Greece in Crete and the question of a union of the island with the Hellenic kingdom.

Bombardment of Canea.—The insurgents occupying the hills back of Canea on Feb. 19 sent a

warning of their intention to attack the town from Akrotiri. To this notice Admiral Canevaro sent a reply giving the insurgent leaders to understand that the foreign war ships would intervene at the first sign of an attack. In spite of the warnings of the foreign admirals, Col. Vassos and his soldiers took the offensive and attacked the Turkish outposts at Platania, which were driven back toward Canea. One of the Greek vessels opened fire on the Turkish fort, but desisted when fired upon by a ship of the foreign fleet. On Feb. 19 the Greek ships were permitted to land large supplies of provisions, both for the regular force at Platania and for the insurgents at Akrotiri, the members of both forces being in sore need of supplies. The Turkish garrison at Bukolies, with the Mussulman families that had taken refuge there, were attacked on Feb. 19 by Greek troops with artillery. The fort was demolished before the garrison of 450 men abandoned it and retreated to Alikiano, where they were sharply attacked and surrounded once more. Mussulmans in Canea, although the Turkish authorities were forbidden to distribute arms, received Martini rifles and went out to relieve them. A column of 500 Turkish soldiers and 500 irregulars was held in check by 200 Cretans in a defile until a battalion of infantry and a company of rifles sent by Col. Vassos came up. The Turks made a desperate defense, but were defeated by the Greek troops and pursued almost to Canea, losing 50 killed. In these operations the Greeks gained possession of the castles of Livadia, Monodendrion, Anempali, and Aya. Their losses were 4 officers, 18 soldiers, and 100 Cretan irregulars.

The Christian insurgents having advanced against the town in the face of solemn warnings, the admirals of the foreign fleet, on Feb. 20, visited Col. Vassos and summoned the commander of the Greek war ship "Navarchos Miaulis" in order to repeat their warning that if the Greek troops or the insurgents approached to attack Canea the fleet would shell them. The Greek naval commander would not accept any message for the insurgents. Col. Vassos replied that he did not intend to attack Canea or the flags of the powers. Notwithstanding this assurance the insurgents, who had announced their intention of occupying the heights over Halepa and warned the foreign consuls to leave that village, advanced on the position. The first fighting took place on the hills east of the town on Feb. 21, where the Cretan Christians attacked the Mussulmans and were driving them out of their positions. The Christians raised the Greek flag on the crest of a hill in plain view of the ships and began firing upon the Turkish fort and into the town. The admiral of the united fleet then signaled the vessels at that end of the line, which were three English ships, and one vessel each from the German, Italian, and Russian squadrons, and they promptly opened fire on the Cretan position. After the British ships had fired 40 shells and the others about 30 the insurgents, whose position had become untenable, hauled down the Greek flag. The firing, which had lasted ten minutes, then immediately ceased at a signal from Admiral Canevaro. Thereupon the Greek flag was again hoisted, and the Cretans once more showed themselves in full force on the rocks, but were more busy removing their wounded than in replying to the fire of the Mussulmans, who now, emboldened and encouraged by the assistance of the fleet, began a lively fusillade on the Cretan position. During the bombardment the Greek dispatch boat "Peineios" opened fire upon a Turkish frigate, which returned the shots, but when the fort fired at the Greek vessel, using blank cartridges only, the latter withdrew. The Turkish losses in the various engagements amounted to 500 killed, wounded,

and missing, and 104 prisoners. The insurgent forces that attacked Canea were commanded by Greek officers, and had regular Greek troops scattered in their ranks. They advanced by a forced march in a soldierlike fashion, using all the strategy necessary in that rugged country to guard against surprises. The Turks, seeing that the fleets did not move, sent a part of their small force to meet the insurgents after the latter had fired upon the outposts and driven them in. In the skirmishing of the outposts they showed to less advantage than the insurgents. The attack in force was not expected to take place till the following day, but the naval commanders determined to act at once, according to their threat. The war ships, extended in a long line, fired methodically one after the other. The insurgents, who had taken the necessary precautions, retired rapidly into the defiles and ravines as soon as the bombardment began, leaving nothing in sight but their abandoned camps, at which the gunners of the different fleets, vying with each other, made excellent practice, firing at the positions rather than at masses of men, so that all the casualties occurred in the first two or three cannon shots, when the insurgents, taken by surprise, had not yet made up their mind that the bombardment was serious. About 150 men were hit by the bursting shells. A few of these fell in the town of Canea, making wreck of whole streets. The French and Italian vessels were at the farther end of the line, so that the order to cease firing was given before the turn came to them to fire. The Greek official report of the action admitted that the insurgents took possession of the heights above Halepa, but asserted that firing then began from the Turkish bastions and outposts and from the Turkish man-of-war in Suda Bay, and that when the insurgents replied the foreign fleet opened fire and did not cease till more than 100 shells had been thrown into the insurgent positions.

The foreign admirals on Feb. 25 issued a proclamation extending the zone under the protection of the powers to the plain about Canea and to Suda, and warning both Christians and Mohammedans that any acts of hostility within this area would be suppressed by force. The foreign war ships no longer permitted Greek expeditions to land in Crete, and even stopped the victualing of the troops and insurgents from Greece. No communications were allowed between the Greek war vessels and Col. Vassos. The Christians at Selino were finally compelled to permit the departure of the besieged Moslems and their families, and the foreign war ships in the harbor took the fugitives on board. In like manner an Italian cruiser compelled under threat of bombardment the Moslems of Hierapetra to release the Christians that they held as hostages to save their town from being attacked by the insurgents. In Canea the Konak, or Government palace, was burned by incendiaries on Feb. 25.

On Feb. 26 serious fighting took place at Vrisina, near Retimo, where the Moslems were forced to retreat, leaving the insurgents masters of the field. There was a sharp fight at Malaxa, which the Turks from Canea succeeded in revictualing with a loss of 11 killed and 10 wounded. An insurgent cordon of 15,000 men surrounded Canea an hour distant. The chiefs assured the captains of the war ships that they would abstain from attacking the city for the present. Another force, 5,000 strong, threatened Hierapetra, against which Col. Korakas led an attack with three guns. Fresh fighting occurred outside of Hieraklion, where the Mohammedans were repelled by the Christians. The investment by Korakas of this town, now containing 25,000 persons, counting the regular Mohammedan population and the refugees, was complete, and large numbers of refugees

were already dying of starvation. Repeated sorties having proved futile, the officials implored the assistance of the foreign war ships to raise the siege. Tewfik Pasha, the new military Governor of the island, arrived in Canea on Feb. 28. The international fleet took measures, in the first place, to relieve as soon as possible the beleaguered Mussulman populations in the interior, and then to prevent or to localize the armed conflicts between the Turkish Bashi-bazouks and the Cretan insurgents. The insurgent leaders had little or no control over a large number of their followers, whose object was plunder, and who were encouraged in their depredations by the Greek agitators scattered all over the country. A large proportion of the insurgent forces consisted of such marauders, bent on exterminating the Moslem Cretans and appropriating their property, over whom no restraining power could be exercised by the Cretan leaders, while the Greeks had no wish to restrain them. The power of the Turkish authorities over the Bashi-bazouks was much greater, and the officials were held accountable for the misdeeds of the latter, while the Greeks disclaimed responsibility for the acts of the insurgents altogether, and the insurgent chiefs stated their inability to control the rougher part of their forces. Every man and boy on the island was provided with arms. The Greek regulars assisted and directed the insurgents in all their military operations, both with advice and leadership. The admirals insisted that nothing could be accomplished toward restoring order and tranquillity on the island until the Greek forces were withdrawn. While they remained it was impossible to get the self-government offered to the Cretans by the powers to the knowledge of the native inhabitants of the island. The admirals on Feb. 28 issued a proclamation declaring their purpose to oppose any hostile acts by Greeks, Turks, or Cretans by having war ships at any point where disturbances might occur. War ships were sent to relieve the beleaguered garrisons at Selino and to bring off the refugees. The insurgents in March captured Fort Stavaros, commanding the village of Cadano, or Kandamos. The garrison and refugees numbered 3,700 souls, and these would all have been massacred had not Col. Vassos induced the insurgents to allow their departure.

Ultimatum of the Powers.—The admirals informed their respective governments that anarchy was increasing, and that they could not answer for the avoidance of conflicts unless they were authorized to prevent the landing of all supplies, and unless the powers obtained from Greece the recall of her troops and fleet. Col. Vassos withdrew his troops from Platania and marched into the interior. The Boule, on Feb. 23, passed the following resolution: "The Greek Chamber, interpreting Panhellenic sentiment and opinion, expresses, in behalf of the sacred rights of freedom and Hellenism in Crete, its deep grief at the unfortunate occurrence of the bombardment of the valiant champions of liberty in Crete by the combined fleet of Christian and civilized Europe." The King of Greece addressed a message to the army saying that in the present critical circumstances he relied on the aid of the nation, the officers, and the army in general, and on no foreign power. On the same day Capt. Tritakis left the Piræus with another band of volunteers for Crete. A force of 600 Greek troops with guns and ammunition had already landed at Chersonesus, in the province of Candia. M. Delvaunis made a statement in the Chamber to the effect that, whether the Porte were prevented by the powers from sending re-enforcements or persisted in sending them, the Greek Government had fully decided on the measures to be taken, and would execute them promptly and decisively. On the departure

of the torpedo boats the Greek Government addressed a note to the powers declaring that Greece could not remain a mere spectator of events in Crete, not only from a sense of her duty toward the Christian population of the island, but also by reason of the sentiments she entertains for people of the same race and religion; nor could she remain indifferent when Crete demanded a union with the mother country. The Greek Chamber voted money for the relief of the Cretan refugees, of whom 8,000 had already arrived at the Piræus, many of them in a destitute condition. The English and German cabinets, the two most divergent in their views, consulted as to a collective note conveying an *ultimatum* to Greece and Turkey. The British Government, on Feb. 25, telegraphed to all the capitals a declaration of the policy it intended to pursue, which was that the establishment of administrative autonomy in Crete was necessary to the termination of the international occupation of the island; that, subject to such system of autonomy, Crete ought to remain a portion of the Turkish Empire; that the governments of Greece and Turkey ought to be informed of this resolution; and that, if either Turkey or Greece persisted in a refusal when required to withdraw her naval and military forces, the powers should impose their decision by force. The Greek forces were to be required to withdraw at once, and the Turkish forces as soon as the new organization got into working order. The settlement now outlined by Lord Salisbury was a plan that had been propounded some time before by Count Muravieff, the new Russian Minister of Foreign Affairs, to which Great Britain was the last to give adhesion, Germany having agreed to it at once without reserve, and Austria and France having been the next to accept the proposal. King Georgios and his Cabinet proclaimed their resolve to maintain their present policy, declaring that it was impossible for them to recall their troops from Crete. The popular feeling in Greece was so strong in favor of resisting at all costs the demand of the powers for the evacuation of Crete that the King could not run counter to it without losing his throne. The Greek populace looked upon Crete as already Greek territory, and would not hear of withdrawing the army in Crete, deeming that, if the powers were even unanimously in earnest in making such a demand, Greece had the means of bringing about a general conflagration by making war on the Macedonian frontier, which would result in the advancement of the Hellenic idea and the enlargement of the area and power of the kingdom. The insurgents at Akrotiri sent an answer to the admirals' note, declaring that union with Greece was the only solution that would give definite peace to the island, that autonomy would satisfy neither side, and that Turkish rule was now utterly out of the question. They also made an appeal to the Christian nations of Europe, protesting against the degrading spectacle of Christian fleets endeavoring to suppress the struggle of a Christian nation for liberty when the whole matter could be settled in less than a week by the Greek forces.

The *ultimatum* of the concert of Europe was presented to Greece on March 2 in the following identical note to M. Skouzes from the Austro-Hungarian, English, French, German, Italian, and Russian representatives:

"I have been instructed by my Government to inform your Excellency that the great powers have agreed upon a common course of action with the object of putting an end to a situation which it did not rest with them to prevent, but the prolongation of which would be calculated to compromise seriously the peace of Europe.

"With this view the governments of Germany, Austria-Hungary, France, Great Britain, Italy, and

Russia have come to an agreement on the two following points:

"1. Crete can in no case, in the present circumstances, be annexed to Greece.

"2. In view of the delays caused by Turkey in the application of the reforms agreed upon in concert with the powers, which now make it impossible to adapt those reforms to a changed condition of affairs, the powers are resolved, while maintaining the integrity of the Ottoman Empire, to endow Crete with an absolutely effective autonomous administration, intended to secure to it a separate Government, under the high suzerainty of the Sultan.

"The cabinets are convinced that these views can only be realized by the withdrawal of the Greek ships and troops now in the waters and on the territory of the island which is occupied by the powers. We accordingly confidently expect this decision from the wisdom of his Majesty's Government, which can not wish to persist in a course opposed to the decision of the powers, who are determined to carry out an early pacification, which is as necessary for Crete as it is for the maintenance of general peace.

"I will not, however, conceal from your Excellency that I am instructed to warn you that, in case of a refusal of the royal Government, the great powers have arrived at the irrevocable decision not to shrink from any measure of compulsion if, on the expiration of six days, the recall of the Greek ships and troops from Crete has not been effected."

A collective note of the same date presented to the Porte announced the decision against Greek annexation and in favor of an autonomous administration, or *régime*, at which the great powers had arrived, stating that, animated by the desire to assure the maintenance of peace and to see the integrity of the Ottoman Empire respected, they had sought for the means of ending the disorders that have led to their armed intervention in Crete, as well as of putting an end to the presence of the Greek forces in the island, but now recognized that, in consequence of the delay in applying them, the reforms contemplated in the arrangement of Aug. 25, 1896, no longer correspond to the requirements of the situation. A further collective note, dated March 5, notified the Porte that, as the autonomy to be established in Crete implied the progressive reduction of the Ottoman forces, it would be necessary as soon as the island was evacuated by the Hellenic troops to take measures for the concentration of the imperial troops in the fortified places occupied by European detachments.

A mutiny of the Turkish gendarmes who were about to be disbanded occurred at Canea on March 2. The men refused to give up their arms unless they received fifteen months' pay due them, and when Major Bor, summoning to his aid a guard of marines, commanded them to lay down their arms and proceeded to take their weapons from them, the men, of whom there were 45, fired several shots, killing Suleiman Bey, a Turkish officer in Major Bor's suite. When the Russian detachment of marines fired, killing 4 of the mutineers, they surrendered.

When the people of Athens knew that the *ultimatum* of the powers had been presented, a crowd of 30,000 gathered about the palace, waving flags and shouting for war. Premier Delyannis had the day before denounced the bombardment of the Christians as savage, impious, and unjust, and declared that the blockade of Crete was contrary to international law, and that Greek representatives abroad had protested against it. "We are a small nation," he said, "and can not prevent such acts, but we protest against them with the weight of a great nation, for we know that all great peoples are with us." The first act of the Greek Government after receiving the collective note was to call

out 4 more classes of reserves, making 10 in all, each of 12,000 men. There were 60,000 troops on the Macedonian frontier. Arms, ammunition, provisions, and military stores were conveyed with all speed to Thessaly, where a concentration of troops was proceeding. The Porte replied to the first collective note of the powers on March 5, acknowledging the solicitude of the powers for the integrity of the Ottoman Empire, and declaring the Porte's readiness to adopt their recommendation of Cretan autonomy, reserving for the present the consideration of details. The Greek reply to the *ultimatum*, delivered on March 8, when the time expired, was as follows:

"In view of the extraordinary gravity of the results that will follow, his Majesty's Government considers it to be its duty to submit to the powers its opinion of the measures decided upon, an opinion which is the result of long experience and a profound acquaintance with the situation in Crete.

"Impressed by the sentiments that animate the powers, and their solicitude for general peace, the Greek Government will not fail in this duty, since Greece also ardently desires to contribute to the maintenance of peace, and to save from utter ruin the population of an island put to so severe a trial and so often decimated.

"We believe that the new *régime* of autonomy adopted by the powers unhappily can not correspond to the noble intentions that inspired it, and that it will suffer the fate of the different administrative systems which at various times and without success have been tried in Crete.

"This is not the first time that Crete finds herself in a state of insurrection. In recent times on more than six occasions the horrors of anarchy have shaken and imperiled her existence.

"If, then, the new *régime* with which it is proposed to endow her is not calculated to re-establish order in a definitive manner, the Greek Government can not doubt the impossibility of putting an end by means of it to the present state of revolution. Anarchy will continue to ravage the country with fire and sword in its hands. Blind fanaticism will continue its destructive work of exterminating a people which assuredly do not deserve such a fate.

"Before such a prospect our responsibility would be enormous if we did not most earnestly urge the powers not to insist upon the scheme of autonomy proposed, but rather to restore to Crete what she already had at the time of the enfranchisement of the other provinces which form the Kingdom of Greece, and to lead her back to Greece, to which she had belonged since Capodistrias was President.

"In the presence of the recent scenes of massacre, pillage, and conflagration in Canea, in the presence of the frightful anguish which the inhabitants of Crete have suffered, exposed, as they have been, to massacre by the boundless fury of the Mussulman population, who prevented the departure of Christian families for Greece, which has always been a providential refuge for all these miserable beings, our whole country was torn with remorse for the responsibility it assumed last year in inducing the Cretans to lay down their arms. The misfortunes that resulted forbid us to undertake once more such a task, and if we had attempted it our voice would certainly have been feeble. Its echo would not have reached the Cretan people.

"It being the case, therefore, that a new *régime* of autonomy could not fulfill the noble aim of the powers, it is obvious what would be the situation of the unhappy island from to-day until the establishment of this *régime*.

"If the powers believe it to be their duty to persevere in their resolutions, with the above views, and in the name of humanity, as well as in the in-

terest of the island, the pacification of which is the unique object of the solicitude of the powers, we do not hesitate to appeal to them on the subject of the other measures—namely, the recall of our military forces. Indeed, if, because of the presence of the united squadrons in Cretan waters and in the conviction that these squadrons will not permit Turkish troops to debark on the island, the presence also of all the ships of the Greek fleet off Crete is judged to be unnecessary, the presence of the Greek army on the island is nevertheless shown to be desirable alike from sentiments of humanity and in the interests of the definitive re-establishment of order.

"Our duty specially forbids us to abandon the Cretan people to the mercy of Mussulman fanaticism and the Turkish army, which at all times has deliberately and intentionally participated in the aggressive acts of the populace against the Christians. Above all, if our troops on the island, who are worthy of all the confidence of the powers, had received a mandate to pacify the country, their desires and intentions would have received promptly the most perfect satisfaction. It would be then, after the re-establishment of order, that it would be possible to learn the desires, freely expressed, of the Cretan people for a decision as to their fate.

"The sorrows which have recurred regularly in Crete for many decades past not only do not occur without profoundly agitating the Hellenic people, but they also interrupt social activity, and gravely disturb the economy and finances of the state. Even if we admit that it would be possible to forget for an instant that we share the common religion of the Cretan people, that we are of the same race and bound by ties of blood, we could not in silence allow the powers to assume that the Greek state is able any longer to resist such shocks.

"For this reason we appeal to the generous sentiments animating the powers, and beg them to permit the Cretan people themselves to declare how they desire to be governed."

The Greek envoys abroad were instructed to inform the European governments that Greece was prepared to recognize the temporary suzerainty of the Sultan, to withdraw her fleet completely, and to place the Greek army in command of any military representative of the powers, senior in rank to Col. Vassos, for the purpose of restoring order in the island, if the powers would agree to leave ultimately the decision as to the fate of Crete in the hands of the people.

Blockade of the Coast.—While England, France, and Italy were disposed to regard the Greek note as leaving an opening for further discussion, the governments of the three emperors insisted on applying coercive measures at once. The attitude of the Greek Government made it certain that a blockade of the Piræus would precipitate rather than avert hostilities on the Macedonian frontier. The powers decided to restrict their action for the present to blockading the coast of Crete, and landing troops for the purpose of pacifying the island and preparing the way for the establishment of autonomous institutions. The blockade was announced to begin on March 21. Before that date supplies were hurried in to the Greek troops on the island, which took up position in Sphakia. Notice was given to Greece to withdraw her war ships. A Greek schooner with munitions of war and volunteers on board was sunk by an Austrian gunboat before the blockade began. The foreign admirals issued a proclamation announcing the conditions under which autonomy would be granted, promising the adoption of measures to regulate the workings of complete autonomy, and guaranteeing to every person, of whatever race

or religion, perfect liberty and security of property. They appealed to both parties to lay down their arms, saying that the powers counted on the co-operation of Christians and Moslems alike to aid in the task that promised order and prosperity.

Relief of the Mohammedan Garrisons.—The foreign admirals decided to proclaim the protection of the districts of Selino and Hierapetra. The flags of the powers were hoisted in Selino, but there was danger that the Turkish garrison and the Mohammedan inhabitants would be massacred. The Christians were reported to be exterminating Moslems wherever they went. At Heraklion 60 Moslems were killed in a fight near the gates of the town. The foreign commanders expelled a number of Greek subjects found in the districts under their control, and against this the Greek Government protested. Col. Vassos agreed to rescue Mussulmans at Selino and other places, if they laid down their arms and surrendered as prisoners to be taken to Greece on Greek war ships. The Greek vice-consul was willing to go to Candano to intercede for the captives, if allowed to proceed thither in a Greek war ship. The foreign ships landed 500 men at Selino on March 6, after having negotiated for a long time with the Greek Admiral Keineck. Col. Vassos, and the Greek vice-consul, and only received evasive answers to their demands, while the Greek admiral protested against the obstacles placed by Europe in the way of his action, and Col. Vassos replied that he had no authority over the insurgents. On March 6 the Greek fleet, after receiving re-enforcements, sailed away from Canea. The siege of Candano lasted thirty-five days, during half of which time the place was under constant fire. The place was relieved by a force of 655 European marines with 4 guns, who protected the rescued people on the march to Selino, but was not large enough to prevent many of them from being attacked and plundered by the horde of 7,000 Cretan insurgents surrounding the refugees. The town had surrendered before the arrival of the foreign detachment, and the Moslems narrowly escaped massacre, which was averted by the efforts of Col. Vassos and some of the insurgent leaders. An armistice secured by the intervention of the consuls was declared ended by the insurgents on March 8, and an attack was made on Heraklion. Fighting was renewed on March 9 also in the vicinity of Canea, where the Turkish troops and war ships were allowed to fire upon the insurgents. On the same date the leader Korakas attacked Hierapetra. The Greek vice-consul, Baraklis, was expelled from the island by order of Admiral Canevaro, and this act incensed the Christians. The Selino district was at last cleared of Moslems, of whom 600 soldiers and 2,500 natives were brought away under the supervision of the British consul, Sir Alfred Biliotti. The Mohammedans of Sarakina, which was forced to surrender before Candano, were actually slaughtered by the insurgent Cretans. Kisamo contained a Turkish garrison, which still held out, though the town was demolished by a bombardment of the insurgents. Conferences between the admirals of the foreign fleets and chiefs of the insurgents revealed the fact that the Greek admiral never had transmitted to the insurgents the message confided to him offering autonomy to the island. Nevertheless, the insurgent leaders declared that only union with Greece would satisfy them.

In the blockhouse at Malaxa, an hour's march from Canea, the Turkish garrison still held out. Provisions had been brought on March 7 by a party of 600 men from Canea, which was divided on the return march and the smaller division driven back into Malaxa with fearful loss. On March 24 the insurgents, who had made no impression on the

stone fort with their rifles, battered down its walls with artillery furnished by Col. Vassos and assisted by his officers. The Turks were compelled to evacuate the position, and they would have been annihilated had not the Greek officers interposed to prevent a massacre. When the Greek artillery fired on Malaxa the foreign war-ships shelled the insurgents. In the fighting the Turks lost 60 and the insurgents 200 men. The town of Malaxa was afterward occupied by the international forces. Malaxa was one of the fortified places that the foreign admirals had declared in a proclamation to be needed to maintain security and order, and hence must not be fired on; otherwise they would use force against the attackers. The other forts included in the injunction were Kisamo, Suda, Retimo, Candia, and Hierapetra. Several Greek vessels bringing volunteers and munitions from Greece were seized when they attempted to run the blockade. The signatory powers agreed to land 600 soldiers each to restore order in Crete. Notwithstanding the presence of their troops, warfare, rapine, and pillage went on in every direction. The international forces were powerless to preserve order even in the coast towns. The insurgents captured all the positions surrounding Canea except Butsunaria, which was guarded by international troops, lest they cut off the water supply. Christian and Mohammedan refugees were starving in the mountains. Before the end of March the admirals called for, and the powers decided to send, each a further battalion of 600 men. The insurgents shut up in the Akrotiri peninsula begged food from the war ships, but it was denied them. When the insurgents attacked Izzedin fort at Suda, on March 28, the Italian war ships fired upon them. Another determined attack was made on March 30; the foreign ironclads bombarded the attacking force, and finally landed troops to occupy the fortress. On the same day there was fighting at Retimo and Heraklion. In a two days' battle at Spinalonga the Turkish garrison met with a heavy loss, and was finally compelled to flee to an island. A vessel bringing ammunition fell into the hands of the insurgents. A British war ship revictualled the forts at Kisamo after shelling the insurgents, who had nearly undermined the fortifications. At Kisamo the war ships fired 80 shells into the camp of the insurgents because the latter fired upon boats that were taking Mohammedan women and children from the fort to the ships.

Withdrawal of the Greek Troops.—The Russian consul had several interviews with the insurgent chiefs, who emphatically refused to accept autonomy. Later the British, Austrian, and Russian admirals met by appointment near Candia a large delegation of insurgents, but their spokesmen were Greeks, who declared that the Cretans would have annexation or death, and wanted to turn out all Turks and Moslems. The Christians had already taken possession of much Moslem property in the country districts, and hoped, under Greek auspices, to acquire the property of the Moslems in the towns also. The foreign occupation at Canea embraced an area of 25 square miles, within which limit food was furnished to all inhabitants in need of it. The area was guarded by 10 companies of Turkish regulars and 8 companies of irregulars, which were reinforced from the city whenever engaged. The foreign admirals were strongly opposed to the withdrawal of the Turkish troops, of whose behavior they spoke in the highest terms, Admiral Harris praising them as second to no European troops in discipline; for if they were withdrawn, the European troops would have to act as supports for the Bashi-bazouks, liable to be drawn into their skirmishes, and if the latter were also withdrawn then the international

forces would be likely to come into conflict with the insurgents and would have besides to restrain and control the large Moslem population behind them, as well as the disbanded irregulars.

On April 3 a collision occurred between the insurgents at Akrotiri and a party of 400 Bashi-bazouks that had stolen out of Canea, and the latter, only a part of them being armed, lost 50 dead and wounded. On their return they were disarmed by the international troops. The insurgents had received permission to go from Akrotiri into the interior of the island, and the purpose of the Bashi-bazouks, most of whom were refugees from Candano and Selino that had obtained arms surreptitiously, was to block their passage. The same class continued to pillage the environs of Canea. There was little food in the island except in the camp of Col. Vassos, which was provisioned for three months. The Mohammedans on the seacoast suffered more severely than the Christians in the interior. Steamers bound for Crete with provisions for the foreign fleet and the Turkish troops were boarded at the Piræus by armed Cretans and their friends, who threw the cargoes overboard.

When war was begun in Thessaly the Greek Government sent a note to the powers protesting that, inasmuch as Greece and Turkey were at war, a continuance of the blockade was a violation of neutrality. The Governor of the island on April 19 issued a manifesto notifying the Greeks to leave Crete within fifteen days, in accordance with the orders of the Porte banishing all Greeks from Ottoman territory. The environs of Heraklion were in April the scene of almost daily fighting between the small garrison of Turkish troops and 5,000 insurgents, with Greek troops among them. When reverses overtook the Greek army in Thessaly the Hellenic Government would gladly have withdrawn from the Cretan adventure if Col. Vassos and others of the ablest officers of the army who were shut up in Crete could have been at home. In the early part of May Col. Vassos made a request of the foreign admirals that the sea and coast blockade be sufficiently relaxed to enable him to embark his troops safely. This the admirals refused to do. They offered to allow the Greek troops to receive supplies of food, a concession that they had already offered to the insurgents. Soon afterward the Greek Government approached the powers with a view of obtaining their mediation. The representatives of the powers advised the Hellenic Government to withdraw the Greek forces from Crete as an inducement to the powers to offer their mediation. According to this advice the Hellenic Government asked for the free passage of a ship to take the troops back to the Piræus. Col. Vassos had already departed secretly, and others were allowed to leave in small parties before the permission was given formally. The Cretans did not appear dismayed by the loss of Col. Vassos and the Greek volunteers, but continued to attack the Turkish outposts. The international troops, by arrangement with Col. Vassos, had some time before considerably extended their zone of occupation. The six powers made on May 11 the offer of mediation with a view to obtain an armistice and smooth the difficulties existing between Greece and Turkey, imposing the condition that the Hellenic Government should declare that it would proceed to recall its troops from Crete, adhere formally to autonomy for Crete, and accept unreservedly the counsel that the powers should give in the interest of peace. The Greek Government accepted all these conditions. The troops began to leave Crete immediately on three Greek steamers which had been captured during the blockade and were released for the purpose of taking the troops back to Greece. Col. Staikos, the Greek com-

mander, was incredulous, and refused to embark until he received orders direct from Athens. The Cretans were dismayed, and were at first inclined to resist the embarkation of the Greek troops. Their political excitement soon began to die out when they realized the futility of hoping for annexation.

Restoration of Order.—The departure of the Greek forces led to an increase of lawlessness on the part of both Christians and Mussulmans. The admirals were not willing yet to have the Turkish garrison withdrawn, as they had not the force to prevent the massacre that would follow, and moreover did not wish the European troops to come into conflict with the insurgents. In Heraklion there were 1,500 European troops holding the fortifications, while 3,500 Turkish troops formed the military cordon and guarded the 50,000 Mohammedans in the city against the 60,000 armed insurgents who invested the place and added to the sufferings of the half-famished Moslem peasants huddled in the town by frequently cutting off the water supply. Of 107,000 Mohammedans in the island, 67,000 were in receipt of relief from the Sultan.

Many times shots were fired at foreign officers. The insurgents on recommendations from their Greek friends refused to accept autonomy except on condition that the Turkish troops be previously withdrawn. A policy of firm conciliation was demanded by the situation in order to undo the mischief wrought by the intrigues of the Greek patriots. The Greek consul, army officers, and naval officers had fostered the idea of an insurrection in favor of replacing the Turkish by the Greek Government, and the international naval force, by permitting munitions of war to be landed under their eyes and by taking no effective steps to check the actions of Col. Vassos's forces inland, gave countenance to the assertions of the Greek officers that the powers, in spite of protocols and proclamations to the contrary, would suffer the revolution to be consummated. The Cretans, both Christian and Mussulman, unsupplied with any information but what they received through the Greeks, had the evidence of their own eyes as to the presence of the Greek troops, Greek guns, and Greek flags successfully attacking Mussulman positions and sacking, burning, and pillaging the villages of the Mohammedans. Hence the prospects of a peaceful settlement that seemed fair when the international fleets appeared in overwhelming force in the latter part of February, at which time the chief desire of all parties except the Greeks appeared to Admiral Harris to be for peace and good government, soon were lost, and the peace party disappeared in the background. The Christians as a whole had no sentimental desire for Greek rule; they wanted, above all, a government that would maintain law and order among the various factions. With the progress of anarchy and demoralization the Christian and Mohammedan combatants alike grew in love with the excitement of battle without much danger to life and with the pleasures of idleness, so that it would take long years before many of them would care to return to agricultural toil. The Cretan Moslems, who had lost most and had most to lose by revolution, professed themselves ready to accept any form of autonomy or government by the great powers, but not Greek rule, which they declared they would resist to death, if necessary. The rougher element of that party became troublesome after the departure of the Greek troops, the last of which were taken away by Col. Staikos on May 23. There were 35,000 Mohammedan refugees crowded into Heraklion, many of whom, lacking the necessities of life or fodder for their cattle, made raids into neighboring districts, which resulted in conflicts with armed bands of Christians. On May 29 armed

bands of Mohammedans from Heraklion burned the village of Kalivia and killed 14 persons. This raid exasperated the Christians, who had petitioned Col. Chermiside, commanding the British and Italian troops in Candia, to restrain the Mohammedans from trespassing beyond the neutral zone established round Candia, which they themselves undertook to respect. They could not be convinced that the Ottoman authorities and the international troops occupying Candia did not connive at the sortie. Some persons who were arrested in connection with the raid were forcibly rescued by their coreligionists of Heraklion, after which the other prisoners were sent to Canea. The active insurgents were still bent on continuing the struggle for union with Greece. A provisional government was proclaimed at Alikianu under the presidency of a prominent chief, Hadji Michali, who said that he had been intrusted by the departing representatives of Greece on their embarkation at Platania with the task of maintaining order and security. He thanked the natives of the province of Kydonia for their orderly and willing submission to Greek authority. The first measures that he proposed to adopt were the enrollment of a strong body for the defense of the positions between Malaxa and Platania and the constitution of a communal police, whose special care would be the protection of the Mohammedan property that had escaped pillage or destruction. He recommended the convocation of a general assembly to consider the situation and adopt such further measures as might be necessary. In a second proclamation he appealed to the Christians to show moderation and discipline by respecting and protecting the property of the Mohammedans and by living at peace with them, declaring that the struggle entered upon by the Cretans was not directed against their Mohammedan brothers, but against an incapable and unworthy government. The proclamations were carefully worded so as to avoid the least reference to the questions of autonomy or annexation. The Cretan committee at Athens again began to dispatch volunteers to Crete. One band was captured with a considerable quantity of arms and ammunition on board a vessel. Vessels bringing back islanders to their homes were permitted to land these, but no munitions. Some of the most influential insurgents who had left the island to fight as volunteers in the Greek army wrote to urge their brother Cretans to submit to the inevitable and accept an autonomous constitution, warning them against the policy of the Cretan committee in Greece, which would prefer that Crete should remain under the Turkish pashas rather than that it should be granted autonomy under international guarantees. While the districts of Canea and Retimo were kept in order by the international forces, disturbances continued to occur at Candia, where the Turkish garrison was powerless in the face of the large Mohammedan population, which was compelled to go outside of the protected zone to obtain pasture for the cattle, and thereby came into constant conflict with the insurgents. A series of raids culminated on June 26 in an attack on the village of Kani Kasteli by 1,000 Bashi-bazouks, who killed more than 25 Christian villagers and returned laden with booty, which was openly sold at auction in the town. The foreign garrison was insufficient to protect Christian houses in the town from plunder by this lawless Mohammedan element. The Ottoman authorities were entirely impotent. The treasury was empty, no taxes having been collected for more than a year. The gendarmerie, who had received no pay for that length of time, were confronted with starvation and threatened to mutiny. In Canea Mohammedans who had taken possession of Christian houses

on being threatened with eviction set those houses on fire. Provisional tribunals composed of Mohammedans and Christians were appointed by the Governor here and at Candia and Retimo. On June 14 Ismail Bey, the acting Governor, issued a proclamation announcing that the international fleet would prevent foreign vessels from landing cargoes on which no customs duties had been paid. This order was not effectively carried out; hence no revenue was obtained from this source. On June 24 the Governor informed the Turkish irregulars at Heraklion that he had no more rations to give them. At the same time the killing of Moslems from ambushes exasperated the latter, and on June 26 they made a raid on the Christians who had taken possession of the Moslem village of Kani Kasteli, where a desperate combat took place. Sharp friction occurred in July between the native Mohammedans and the foreign troops both at Heraklion and at Hierapetra. Col. Sir H. Chermiside issued a proclamation forbidding the people of Candia or Heraklion to carry arms, and on July 16 the disarmament was carried into effect, as similar orders had been at Canea and Retimo. On the following day the Christian insurgents attacked the whole front of Turkish outposts, which had recently been doubled in order to check the raids of Bashi-bazouks, who had sanguinary fights with the insurgents in Episcopi and other neighboring villages. In Canea the Mohammedans assumed a truculent demeanor toward Christians. All rights of property in the island were in hopeless confusion. The land and movables of one faction had been treated as lawful spoil by the others. Houses that they had not rifled and burned, olive groves not yet devastated, and crops that were left standing had been quietly appropriated by Christians in the country districts. They had driven off flocks and herds to their own pastures or had seized them with the land from which the owners had been forcibly evicted. In the towns the Mohammedans had in like manner taken possession of desirable residences and shops in good locations.

The admirals determined to extend the zone of military occupation. When columns of European troops marched out into the country, the insurgents fired upon them, saying afterward that it was by mistake. The admirals, disbelieving the excuse, announced that the columns would henceforth take cannon with them and severely repress any attack. The Porte issued a circular to the powers, informing them that, if they could not maintain order, a Turkish army would be dispatched to the island. The admirals and consuls had many weeks before urged their respective governments to send reinforcements to Crete, but their representations had been without effect. After the meeting of the Cretan Assembly the task of preserving order became much easier. The insurgents who had besieged Heraklion and other places dispersed to their homes to attend to the crops. On July 24 Djavad Pasha, former Grand Vizier and once Vali of Crete, arrived to assume command of the imperial troops in the island. This caused an effervescence of excitement among the Mohammedan population, but there was no serious recurrence of violence, the Bashi-bazouks having been disarmed and the desperate characters arrested and deported. The European troops now marched through the country unmolested. The irregular troops in the outposts, composed of Mohammedan Cretans, were replaced by Turkish regulars, who effectually averted disorders. The insurgents promised the admirals not to cut off the water supply of Candia. Some attempt was made to extend the grazing areas. When the Porte proposed to send war ships and troops to Crete the admirals announced that they would not permit the

vessels to enter the Bay of Canea. The proposal to extend the military zone round Candia, which Djavad Pasha urged in order to enable some of the refugees in the city to settle down in their homesteads again among their Christian neighbors and thus make a step toward the restoration of peaceful relations, was accepted by the insurgents on condition that the international troops should form the outer line. Col. Chermiside, however, had not enough troops for the purpose, and he found that the Mohammedans were less anxious than they had been to return to their farms, for the crops had already been gathered by Christians. The plan was therefore abandoned. There were in August 2,020 British, 1,412 Italian, 1,400 Russian, 1,250 French, 600 Austrian, and 11 German troops in the island, while a French, an Italian, and a Russian battalion stood in readiness to embark for Crete. The Turkish regular troops consisted of 15 battalions, each numbering from 550 to 600 men.

The Cretan Assembly.—On their departure from Crete, Col. Vassos and the late Consul-General Gennadis, acting as Greek royal commissioner, called upon the Cretans to nominate members to a revolutionary assembly and to elect a provisional government, with the mandate of carrying on the administration and national policy initiated by Greece. The constituencies, however, despairing of union with Greece, instructed their delegates to accept the proffered autonomy and discuss its details, with the proviso that the Turkish troops should be withdrawn. The admirals encouraged the holding of the Assembly and offered to consult with the delegates as a representative body expressing the desires of the Christian population. There was a long struggle over the place of meeting, which was finally decided by the Assembly sitting for the first two weeks in Armeni, a village of Apokorona, the center of the warlike agitation in the west, after which it was to be held among the moderate and pacifically disposed eastern Cretans in the village of Arkhanes. The western districts were very much overrepresented, but their delegations were cut down by the Assembly so as to make the representation of the east and west more nearly equal.

The Christian delegates met at Armeni on July 10, and, assuming the style of the General Insurrectionary Assembly of Cretans, elected Dr. Sphakianaki, President, and Dr. Tsouderous and M. A. Criaris, Vice-Presidents. The delay in assembling, due largely to the neglect of the Cretan question by the powers during the peace negotiations, had given the Athenian committees a chance to resume their influence over the Cretan delegates, many of whom during the long weeks of preliminary negotiations had to depend on the Greeks for the money to pay their board. The delegates were warned by their Greek advisers not to declare for the proffered autonomy, and to insist on the withdrawal of the Turkish troops as a preliminary condition of any negotiations; then, after the last soldier had departed, to ask for union with Greece, and, failing this, to abate their demands gradually to a Greek occupation on the model of Bosnia, next independent autonomy, then autonomy under the suzerainty of the Sultan, under conditions to be decided by a newly elected Assembly, and last the continuance of the *régime*. The annexationist party was not numerous in the Assembly, though resolute; a large section was undecided, and preferred waiting till the conclusion of the Greco-Turkish peace negotiations; while opposed to either policy was a strong autonomist party, willing to accept the settlement offered by the powers on condition of the withdrawal of the Turkish garrison. The annexationists carried the Assembly with them in the beginning and induced it to send an address to the Athens committee and

to adopt Greek insignia, causing the admirals to decline to hold communications with the delegates unless they abandoned their Greek programme. After many of the western delegates had gone to their homes the Assembly was adjourned by the autonomists, to meet again in Arkhanes. Meanwhile some districts voted in favor of autonomy.

The Assembly convened at Arkhanes on July 31, and after recording a protest against the presence of Djavad Pasha in Crete and rejecting a motion to nominate a provisional government, as calculated to perpetuate the insurrection, appointed a committee to draft an administration and judicial organization of the country. The followers of the *Ethniké Hetairia* afterward gained the upper hand, elected Benizelos president, and nominated a provisional government, consisting of subsidized agents of the Athens committee. This action roused the people of the surrounding districts, whose Deputies returned to the Assembly, and on Aug. 26, by a majority of 60 to 12, adopted a memorandum declaring that the Assembly, acting in behalf of the Christian population, would abide by the decision of the powers, accepted the proffered complete autonomy, and emphasized the fact that no autonomy could be carried out if the Turkish troops remained. M. Benizelos was dismissed from the presidency of the Assembly.

Preparations for Autonomy.—The French Government on June 1 submitted to the powers certain proposals as to the measures to be taken toward the establishment of the new autonomy in Crete. They comprised the enrollment of a foreign gendarmerie, the arrangement of a loan for the expenses of this gendarmerie and of inaugurating the new administration, and the selection of a governor. These proposals had the support of the Russian Government and they were finally accepted by the powers as the basis of the new autonomy. Lord Salisbury, seconded by the Italian Government, expressed in August the view that it would be inexpedient to organize autonomy pending the conclusion of the peace negotiations between Greece and Turkey. M. Droz, of Switzerland, was invited to the post of Governor, for it was decided to have a European Governor; but he declined. It was decided to convoke the General Assembly on the inauguration of autonomy. The withdrawal of the Turkish troops was to take place gradually. The admirals decided on Aug. 12 to institute a military commission to administer justice in a summary manner. Against this the Porte protested as a violation of the sovereign rights of the Sultan. It was decided to maintain the blockade for the present to prevent the landing of volunteers or arms. The Turkish outposts were gradually called in and replaced by European troops. The Cretan representatives having accepted autonomy without making it conditional upon the departure of the Turkish troops, the Russian Government proposed to raise the blockade on Sept. 10, but the other cabinets would not consent. The Turkish gendarmerie were placed under the command of European officers, the powers agreeing to bear the expense of maintaining the force, in consideration of which they received half the customs revenues and the surtax. Suddenly the Porte made a demand that the powers should sanction the appointment of a Christian Turk as Governor with the title of Vali, and that the Turkish troops should be maintained in the chief towns. Outrages were still committed by insurgents in various parts of the island. Near Canea they fired upon Austrian troops on Oct. 3. The Mohammedans were not yet restored to their lands, although the seedtime was passing. The admirals extended indefinitely the delay of two months decreed for the restitution of land and houses. The Mohammedans in the cities,

who for a long time refused to deal with or work for Cretan Christians, and the Christians who had held them besieged and deprived them of food and water, began to fraternize with them, but where there were no European troops or gendarmerie to keep order collisions occurred. The insurgents declared that the Mohammedans were at liberty to return to their homesteads, provided they were not escorted by Turkish troops, but the admirals did not consider it safe until a large and efficient gendarmerie were organized to provide for their security. The Turkish gendarmerie were found to be useless, as they would not arrest their co-religionists. European experts estimated the damage done to their property at 20 to 35 per cent. Col. Schaefer, of the Luxemburg army, was proposed in October as a provisional commissioner for the powers, to assume military direction for the restoration of order, but the Ottoman Government objected, and Germany supported the objection.

CUBA, the long irregular-shaped island lying about 87 miles south of Florida. It is the largest of the West India group, and, with the exception of Puerto Rico, is the last of the Spanish possessions in the New World. [The condition of affairs in Cuba during the present insurrection has been such as to make it next to impossible to obtain accurate information of events there. The articles in this "Cyclopædia" have been compiled from the best available sources, but were necessarily liable to inaccuracy from the very nature of the case. This year we are enabled to present a consistent account, written by a gentleman who has followed the campaigns there for two years, has been in both camps, and has traveled widely through the territory affected by the military operations, and who, moreover, being simply an American citizen in search of information, may be trusted for a disinterested account.—EDITOR.]

Population.—The latest census of Cuba, taken in 1887, gave the total population as 1,631,619. Of these, 950,000 were white creoles, 500,000 were colored, and 160,000 Spaniards, emigrants from Spain. In addition, there were about 50,000 Chinese, imported originally to replace slave labor, which was freed ultimately in 1886. This population was very unevenly distributed in the several provinces, being to each square kilometre as follows: Santiago de Cuba, 7.75; Puerto Principe, 2.10; Santa Clara, 15.34; Matanzas, 30.59; Havana, 52.49; Pinar del Rio, 15.09. To classify this population as white and colored creoles and native Spaniards seems insufficient. It is generally supposed that the Cubans are a mixed race, whereas the greater mass of them are pure whites, and the social lines between white and black are drawn very much as they are in our Southern States. The present insurrection has brought forth a strange and incomprehensible people known as the *pacificos*. Although little understood by the foreigner, the *pacifico* is rightly named by both his Spanish oppressor and his insurgent brother in the field. He is truly pacific. He represents fully half of the Cuban population, and his submissive character is reflected upon the rest of the Cuban people. It is this submissiveness, more than anything else, that has caused the Spaniards to appear as tyrants in the island of Cuba. The *pacifico* will not oppose, retaliate, or fight. The tax collector may come round with his exorbitant list, but the Cuban peasant has no word of protest. On the contrary, he orders his fattest pig killed and roasted, and not only serves it to the representative of an avaricious Government, but in all probability slips a coin into his hand. The *pacifico* seems incapable of hatred. Peace at any price is his motto. The economic question is nothing to him, and he cares little whether the land is

not. A mere patch surrounded by a prickly hedge serves to supply his immediate wants of sweet potatoes and yams. The necessity of work and economy is incomprehensible to him, and his idea of happiness seems to consist in letting things run as smoothly as possible. Although professedly a Roman Catholic, he little understands the religion, and cares less. He is apt to look upon the priest and the *guardia civil* with an equal amount of fear, they both being Spaniards. His only vice besides indolence is his love for cockfighting and a mild form of gambling. He is fond of poetry and song, and, when not too indolent, he may be found composing verses of his own. Next to the Cuban peasantry in numbers comes the negro. The negro has been badly represented in Cuba, and as a real political factor he has counted for much less than is generally supposed. Neither the white creole nor the Spaniard has taken very kindly to him, and he looks on both with suspicion. Although many negroes had obtained their liberty long before the final abolition of slavery, in 1886, they do not seem to have followed the example of the Spanish colonists and taken to the occupation of the rural districts as small farmers; they have preferred to labor in the field for the sugar planter or have looked for employment within the towns and cities. Standing between the peasant and the negro is the mulatto, who usually lives in the towns and follows occupations that require skilled labor—as the making of cigars, shoes, clothes, and carpenter work. The really industrious class of Cuba are the Spanish colonists. They are encouraged to immigrate from Spain under such inducements as exemption from military duty, and they come to Havana usually as apprentices determined to work their way to the front, and for a generation at least they form a small class of hard-working and industrious people. Then follow the intelligent, well-educated Cubans, who are mostly sons of rich families, not so far removed from Spanish ancestry as the peasants usually are. These are the Cubans mostly met with in the United States.

Resources.—The agricultural resources of Cuba, though generally understood to be great, are really astonishing when it is considered how little they have been developed. While tobacco and sugar have been considered the great wealth producers of the island, little attention has been given to the other products of its abundant fertility. Of the 35,000,000 acres composing Cuba, it is estimated that only 2,000,000 ever have been under cultivation. There are 17,000,000 acres of virgin forest and 9,000,000 acres of fertile plains, which have only served as natural pastures. Of Cuba's commercial wealth, \$68,000,000 worth of sugar and \$9,000,000 worth of tobacco have been exported annually. Owing to the profitability of the sugar industry, when it was practically destroyed in the English West Indies by the emancipation of the slaves vast sums were invested in the Cuban sugar estates, rendering many of them comparable to the abodes of Eastern princes. Extensive tracts of land were mapped out for the planting of the cane, which could be cut year after year without replanting, as is required to be done in Louisiana. In the center of these tracts were constructed the edifices constituting the *ingenios* as they are termed in Spanish) for the manufacture of the sugar, the guarding of the slave help, and the business offices, as also the residence of the owner. On the larger estates the most elaborate and perfect machinery known for the manufacture of sugar from the raw cane juice was procured, and on many plantations a forlike edifice forming an angle with the other buildings was constructed, in which were quartered the slave help before its emancipation. This edifice, built in

the form of a hollow square with cell-like apartments opening into the inner court, is termed the *barricon*. Since the abolition of slavery the cells or apartments are let out to the negro and Chinese laborers employed on the plantation. The owner's residence is often little else than a palace surrounded with gardens of tropical plants and fruit trees, and ornamented with marble statuary and fountains. Porcelain-lined baths contributed to the enjoyment of these abodes, and there were few of the luxuries of foreign civilization that did not add their share to the comfort of the wealthy planter. These estates were flourishing in Havana, Matanzas, and Santa Clara provinces at the beginning of the present outbreak, but during the insurrection of 1868-'79 many of those in the extreme east and south of the last-named province were destroyed. In the valley of San Luis there were 40 of these estates, supplying a lucrative commerce with the city of Trinidad and the port of Casilda, the harbor of which was then alive with American ships. Although, after centuries of cultivation, there is no appreciable diminution in the fertility of this valley, only two of its estates are still devoted to the sugar industry, and these two have only been kept from destruction during the present war by the continual presence of Spanish soldiers. The tobacco industry has been confined almost exclusively to the western province of the island known as Pinar del Rio, although its cultivation had been taken up successfully in that portion of Santa Clara bordering the Sigüanea mountains.

Coffee was at one time the principal source of Cuba's wealth. In the early part of the present century 91,000,000 pounds of coffee were produced in Cuba in a single year, representing a money value of \$20,000,000. The industry was originally started by the French, who made their escape from the negro revolts and massacres in Santo Domingo in the latter part of the last century. With what they had been able to rescue from their shattered fortunes they established themselves in Cuba, resorting to the mountains, as resembling the spots previously cultivated in coffee by them in the other island. It was then supposed that coffee could be grown only on the mountains, but others found that it would grow as well on the lowlands, and extensive plantations were the result. The French planters were driven from Cuba while the Spanish Cortes was in power, but returned to their possessions when the ancient *régime* was restored. The expulsion of the French settlers has been given as the cause of the decline of the coffee industry, but careful research has revealed the fact that in 1828 plantations of coffee extended within a few miles of Havana westward, beautifully laid out and in a high state of cultivation, where to-day nothing remains but vacant fields. These plantations were owned by Americans and Spaniards, those of the French being chiefly in the mountains. It was estimated that there were then six coffee estates to one of sugar, and the tobacco industry was in its infancy. One plantation of coffee is mentioned as having a million trees, and the writer has found an authentic account of a plantation containing 750,000 trees and 450 slaves in a part of the island where at present there is neither the vestige of a coffee plantation nor even a negro population. The price of coffee had begun to decline in 1828, and it was undoubtedly this decline in price, with the expense of carting over bad roads, which caused it almost to disappear as an article of commerce from the island. At the outbreak of the last insurrection there still remained many plantations in the mountains of Santiagode Cuba and Trinidad, but these were destroyed during the ten years of war that followed.

TAYLOR

ADMINISTRATOR'S HOUSE ON PLANTATION, CARMEN DEL CRESPO.

But little attention has apparently been given by the Spanish Government to the source of wealth in Cuba's 9,000,000 acres of natural pasture lands. Spain's political economy never has consisted so much in a direct land tax as in a tax upon industries and commerce, consequently the ranchman, or landed proprietor, may be the owner of extensive pastures over which roam countless heads of cattle, and yet his wealth not be considered by the Government until he negotiates his stock in the market. During the occupation of Pinar del Rio by the insurgents under Maceo, in the present insurrection, it was a strange oversight on the part of the authorities that in attempting to starve the rebels out of that province they did not take into consideration the fact that many heads of cattle roamed over the plains and the forest-covered hills and valleys were alive with hogs, which furnished the insurgent invaders with an abundance of food. The pasture lands north of Trinidad are so well adapted to the raising of horses that it was formerly a common phrase to say that even the beggars of Trinidad rode horsback. Yet one may search the Government records and find no mention of this source of wealth. In the vicinity of Sancti Spiritus, extending eastward to the province of Santiago, are extensive prairies which furnish grazing for great herds of cattle. Some of them are without natural water supply, but they have been provided with enormous wells at intervals. These sometimes reach a depth of 300 feet, and the water is drawn by a noria, a device employed by the Moors when they occupied Spain. This consists of a large wooden wheel made to revolve by animal power, over which passes an endless belt, to which buckets are fastened. The cattle ranges extend far across that part of Cuba termed Camaguey to Santiago province, which is mountainous and covered with dense forests. As an illustration of the internal wealth of Cuba may be cited a typical peasant's home and surroundings, visited in the interior of the island during the present insurrection. The family consisted of a mother and her numerous offspring and her invalid husband. She was de-

pendent almost entirely upon the labor of her only grown son for subsistence, which was obtained from the land, scarcely more than an acre of which was under cultivation. Her possession consisted of 12 *caballerias* of land, and it supplied her with all the necessities of life except clothing and salt. Her products as enumerated at the time consisted of coffee, sugar, molasses, beans, rice, honey, wax, sweet potatoes, yams, yuccas, bananas, corn, poultry, pigs, a cow or two, several horses, and tobacco. In cases of emergency salt, or a fair substitute, could be obtained from the royal palm by a peculiar process of boiling, and the only reason for not raising her own cotton and making her own cloth, as was done by the aborigines, is that with the Cuban, cotton spinning and weaving is a lost art. Everything about the place had a slovenly and abandoned look. The children were either entirely naked or clothed in tattered garments, but what they lacked in clothing they made up in dirt. The bodies were literally covered with it, and the mother herself was not much neater in appearance. A huge wooden mortar, merely a section of a hollowed log, served as a mill in which to clean rice, grind coffee, thrash beans, etc. Cowhides were in use for drying coffee and beans and for making lariats. Receptacles made of the stem of the royal palm served for holding almost anything, from the morning's milk to the boiled dinner, and sections of the wild bamboo served in lieu of buckets to bring water from the river. Even the cups and saucers and spoons were furnished by a neighboring tree, whose gourdlike fruit was easily prepared in various shapes for this purpose. The pots were almost the only things seen in use that were not a product of the immediate vicinity. Even the large mill for the grinding of cane was constructed of timbers obtained in the neighboring woods.

Cuba produces a great variety of fruits and honeys. Oranges, pineapples, and bananas grow to perfection, almost without any attention, and their varieties are not surpassed by those grown in any other part of the world. There are many other delicious fruits which have not yet found their way

into the Northern markets and are not known in the United States. The native woods of the island have been exploited to some extent. It is said that the 17,000,000 acres of forest lands furnish 40 varieties of fine cabinet woods, among them mahogany and cedar. The mineral resources are imperfectly known. Valuable iron mines have been discovered and worked profitably, the ore being exceedingly rich and of a superior quality. Mines have been worked by two American companies, the ore being loaded directly from the mines into vessels and taken to the United States, where the metal is used in the manufacture of Bessemer steel. Large deposits of manganese ore have also been discovered, the ore yielding in some instances 58 per cent. of metal of a superior quality. About 12 miles from Santiago there is a range of mountains known as the Sierra del Cobre, in which are large deposits of copper. One mine was worked by an English company with great profit for many years, but other deposits remain untouched. Bituminous-coal deposits in extensive layers have been reported.

Finances.—Until 1868 the finances of the island were exceedingly prosperous. For many years there was an excess of revenue over expenditure. From 1850 to 1860 the Cuban treasury was in such a prosperous state that with only a tax of 2 per cent. on the produce of rural property and of 4 per cent. on the rentals of urban real estate, a small tax on the sale of realty, the stamp tax, and the custom dues, its surplus never fell below \$3,000,000, while it rose in some years to \$5,000,000. This favorable state of affairs ceased after 1860. Filibustering attempts previous to 1868 and the rebellion of 1868-78 caused a large increase in the estimates for the army and the navy, which previously had been slight. The revenues in consequence of the revolt were much reduced, while the expenses rose to huge proportions. Extraordinary taxes were levied, but they proved insufficient. Loans were obtained, first from the Banco Español of Havana and subsequently from other banks. Treasury notes and bank notes guaranteed by the treasury were issued. The treasury issued bonds guaranteed by the customs dues, and a floating debt for the liquidation of previous expenditures was formed. All these debts were consolidated by the issues of bonds guaranteed by the Cuban treasury to the amount of \$124,000,000 in 1886 and to the amount of \$44,500,000 in 1870. The revenue for the fiscal year 1893-94 was \$26,492,764, and the expenditure \$26,230,176. The military expenditure was \$8,541,200, and the naval expenditure \$1,097,385; the cost of the civil administration, \$3,663,909. In 1895 the expenses of the war added \$122,500,000 to the debt, not counting \$10,000,000 of arrears of salaries and unpaid obligations. In 1896 the war expenses were \$10,000,000 or more every month. The Government in 1895 and 1896, owing to the civil war, could collect no taxes, and the customs receipts at Havana fell off to one quarter the normal amount. The destruction of sugar estates and tobacco fields took from the laboring class their principal means of support, and deprived the Government of its main sources of revenue for years to come. The sugar crop, which was 1,950,000 tons in 1894, was estimated at less than 200,000 tons in 1896, and the tobacco crop at 50,000 bales instead of the normal amount of 450,000 bales. The total exports were valued at \$60,000,000 in 1895, but in 1896 they were not expected to exceed \$15,000,000. The Government estimates of expenditure for 1896-97 were \$92,000,000, and of revenue \$30,000,000. The increase of revenue over that even of 1894 was expected to come from a higher tax on imports, although the whole produce of the country would hardly pay for the foreign breadstuffs needed to

feed the starving population huddled in the cities. When merchants and bankers exported all their gold to Spain and the United States and thousands gave up business and returned to Spain, the Spanish Government authorized the Bank of Spain in Havana to emit \$12,000,000 of notes for the payment of current obligations in Cuba, to be guaranteed by a reserve of \$3,000,000 in silver coin deposited by the Government and redeemed in gold. When the merchants refused to take the new currency except at a discount the Captain General issued a decree ordering all persons to accept the bills on a par with gold, and endeavored to enforce it against the retailers until they began to close their shops; against the wholesalers until they emigrated; against the Stock Exchange and against the bankers, including the Bank of Spain, which refused to accept them in payment for gold drafts on Spain, until the banks closed their exchange departments.

The Insurrection.—The Governor General is the highest official representative of the National Government in the island, having as vice-royal patron all the powers inherent in the patronship of the Indies. His power is almost absolute at the best of times, and his rule is that of a military commander. The laws of Spain are liberal, and they do not tend to deprive the native Cubans of any of the privileges enjoyed by her subjects born in the peninsula, but the administration of these laws has always been bad. The Cubans themselves are a peace-loving, gentle race, but the despotic rule of many military chiefs, from the Captain General down, has given them for generations ample ground for complaint.

A few years ago a young man, educated in Spain, but a Cuban by birth, took upon his own shoulders the task of liberating his countrymen. From a student in Seville and a graduate at Madrid he became a political convict at Havana, and at length, finding refuge in the United States, began his work, which has resulted in the present insurrection. Finding no support among the wealthier classes, he addressed himself to the humbler ones. By his power of oratory he readily won the attention of the latter, and knowing how many failures had been due to the lack of proper organization, he strove to organize. With unceasing activity he sought to bring together all the Cubans residing in the United States, Mexico, Central America, and Colombia, for the purpose of accumulating funds and carrying on a well-directed propaganda for the independence of Cuba. The work soon began to bear fruit. Cuban artisans joined in making weekly contributions to a general fund, newspapers were published, and an active preparation was carried on by the Cuban emigrants, inspired and effectively conducted by José Martí, the father of the present insurrection. In the island secret organizations were formed and members were pledged for the cause, with the special object of knowing the leaders and their followers who could be depended upon to support the movement when the time should arrive for it. When Martí thought the time had arrived he issued an order fixing the date of Feb. 24, 1895, for the uprising. In response, several leaders and their few followers took the field in Cuba, but they remained inactive and undecided. The country people refused to join them, and, except in Santiago province, they were soon dispersed by Spanish troops, and those who were not captured surrendered a few days later. For the first few months the success of Martí's plans appeared doubtful, but with the landing of Antonio and José Maceo, followed by that of Gomez and Martí, the aspect of the uprising changed, and Spain, conscious that the rebellion was assuming a serious phase, sent her most famous general, Martinez Campos, with re-

enforcements to quell the uprisings. He debarked on April 16, 1895, at Guantanamo, and took immediate command of military affairs in the island. His plan was to put down the revolt by fair fighting and judicious enterprise. He had the confidence of the Cuban people, and the leaders in the revolt looked upon him as a just man and a fair fighter. His proposition was to find employment for laborers by the building of roads and public works, and to conciliate the people rather than oppress them; but neither his soldiers nor his officers were educated up to his standard, much less the Spanish people, and with the insurgents in the field and the conservative element opposed to him he soon found things going decidedly wrong.

Maceo and Gomez.—Although the country people of Cuba were not much better prepared to fight against tyranny and oppression upon the landing of Maceo and Gomez than they had been upon the capture of Cardenas by Lopez, in 1850, the present leaders had concentrated years of labor and ambition in their plans. If the people would not fight for their liberty, the leaders well knew that they would not oppose the movement, while a certain class could be depended upon to do some fighting; hence the general plan of winning a people's independence without the actual force of arms was conceived. Antonio Maceo was known to be a brave fighter, with the cause of Cuba's freedom at heart; but he was a mulatto, and the Cuban leaders, who were white, knew that his color would give rise to the belief that the insurrection was a negro revolt. Therefore Marti had visited Gomez at his home in Santo Domingo, and had induced him to embark for Cuba, offering him the command of the rebel army.

Maceo, with several of the former insurgent leaders, sailed from Costa Rica and landed near Baracoa. They were immediately attacked by Spanish soldiers. Making their escape, they were attacked again, and driven from place to place, hiding in caves till only Maceo and two or three others of the little expedition of the original 23 were left to find their way to the leaders, who were already forming bands in the mountains of Santiago. With scarcely better success, Marti and Gomez made their way to the interior with 5 companions, where they joined Maceo and the other rebel chiefs. Here they reviewed their situation, and while Maceo, Quintin Bandera, Rabi, and others determined to scour the country for recruits, Gomez was directed to march into Camaguey, the principal theater of his operations during the last insurrection. Marti, after seeing the Dominican chief well on his way, was to return to the sea in order to embark for the United States and there continue his work as revolutionary agent; but he lost his life in a skirmish at the Mouth of Two Rivers. Gomez, referring to his situation, wrote: "From that moment my position became considerably worse. I was without health, without troops, and without arms." Nevertheless he determined to proceed, "sick not only in body, but in soul as well." To increase his despair, he was informed that "the people of Camaguey wanted no war," and to this effect they had formed a junta with the object of coming to meet him and manifesting the decision of the people of the province and obliging him to re-embark, even offering him the means to do so. One morning at day-break the members of his escort refused to continue their march, on the pretext that they had only agreed to carry on the insurrection in the east, where they belonged, and ought not to be taken from their own province. "It cost me trouble," says Gomez, "to reduce them to obedience." Continuing his own account, "three days later a traitor presented himself to the enemy and informed him

of my situation, and again my escort insisted in their proposition not to follow me. In vain their own officer in command interposed his authority; the soldiers refused to obey. Then, indignant, I rebuked them severely, calling them disloyal and bad companions. 'Return to the east,' said I to them; 'I alone will go to Camaguey.' Even more indignant than myself, Gen. Borrero addressed them energetically, in a manner which I had never before witnessed, for he was of a violent temper. Among other things that I remember hearing him say was: 'You are bad Cubans and worse soldiers. You are disgracing yourselves. Gen. Gomez is a foreigner, who has come to help us in this holy war, and you wish to abandon him, sick and persecuted by the enemy. Oh, if that is the way you do, then the whole world can say with reason that you are cowards.' The words of Borrero impressed themselves on the souls of those men, and they agreed to continue, but not without two or three of their number deserting in the night of that same day."

Gomez confessed that, in spite of his confidence in his friends of Camaguey, there were moments when he could not but feel "troubled with the most terrible doubts." But his hopes were revived upon hearing that Gen. Campos had "urged that his march be stopped at all hazards," for, if he entered Camaguey, Spain might consider her cause lost. Gen. Borrero gave this news to their followers, saying that they were saved, for if Gen. Campos laid such importance upon Gomez's entrance into the territory, it must be for a reason favorable to the revolution. On June 5 the Dominican leader and his small force of Orientales crossed the Jobabo river, and later joined the venerable Cisneros, Lope Recio, Dr. Agramonte, and other instigators of the movement.

While Gomez with such indomitable courage was surmounting the difficulties before him, the Maceos, Rabi, Bandera, Tamayo, and others, mostly colored, were recruiting men and ambushing the Spanish troops in the east. Their ambushes were mostly successful, and each encounter renewed their hopes. On July 12 they gave battle to the columns under command of Santocildes and Campos respectively, on their way to Bayamo. Gen. Santocildes was killed, leaving Campos to take command of the shattered columns and get them into Bayamo. This was looked upon as a victory by the insurgents, who now prepared to carry the insurrection farther west. On Nov. 1 they concentrated in the estate Mala Noche, near Holguin, and there formed the army of invasion, with Antonio Maceo chief in command and José Miro chief of staff. This force was mostly negroes, and, according to Miro's report, consisted of 1,700 men. On Nov. 3 they took up their march westward to enter Camaguey, and there join the general in chief, Maximo Gomez. The Dominican, in his account, says that from the very moment that he joined the men who were to form the provisional government, there began a series of triumphs obtained by force of arms, and the revolution gained consistency and strength. His escort of Orientales, chiefly blacks, was re-enforced in Camaguey by white Cubans from the towns, many of them sons of former revolutionists. With this force Gomez successfully attacked the Spaniards at Altigracia, ambushed a Spanish guerrilla, and took El Mulatto and San Gerónimo. With the booty captured he loaded the men who had been induced with such difficulty to follow him from the east, and sent them back to their homes. From his new recruits he selected a hundred men disposed to follow him wherever he might direct, and, naming them as his escort, he crossed into the province of Sancti Spiritus.

The Trocha.—During the former insurrection a Spanish engineer conceived the idea of separating that part of the island where the Spanish were in active operation from that part of it where there was no insurrection. For this purpose he proposed the construction of a line between Jucaro, on the south coast, and Moron, on the Jucaro river, near the north coast. By this line it was proposed to confine the insurrection to the east, where it had begun, and thus prevent its spreading. This line was termed a trocha, which simply signifies a way or path across a country without regard to its topography or other roads, such as is often cut through a forest to designate the limits of a territory or to mark a boundary. The military authorities entered upon the establishment of the line at once, and

immediately began a series of movements with the object of bewildering and tiring the enemy without risking any real engagements. The success of these movements was crowned by the treasonable surrender of the Spanish garrison at Pelayo, with 50 rifles and 23,000 cartridges. For this act the Spanish authorities sentenced Capt. Feijoo, the commanding officer, to life imprisonment in chains.

On the morning of Nov. 29 Antonio Maceo, with a part of his force, simulated an attack upon the trocha near Ciego de Avila, and as the Spaniards concentrated to give battle at this point, the insurgents marched around an unprotected part of the line, and, without losing a man or firing a shot, joined hands that same day with Maximo Gomez and his followers.

A STREET SCENE IN VILLA CLARA.

such stress was laid upon its construction by the Spaniards that it came to be considered as impregnable as the great wall of China. But when numerous rebel chiefs had crossed it and recrossed it, and the old warrior chief Maximo Gomez had crossed it in company with his wife and servants, the military authorities began to wake up to the worthlessness of their trocha. So badly were the plans of the originator carried out that upon his visiting the line he is reported to have exclaimed, "This is neither a trocha nor a military line, but a badly staked way which serves for nothing." Although it was condemned by both Capts.-Gen. Valmaceda and Campos, when the latter returned to the island in 1895 and found that the insurgents, counting upon greater elements than he had supposed, had entered Camaguey, he hastily distributed nearly 50,000 soldiers along the old line between Jucaro and Moron, hoping to keep them from entering the province of Santa Clara. Forts were rapidly constructed, and trees and undergrowth cleared away for 200 yards each side of the railroad track which ran along the line; and thus came into existence for a second time the old trocha as a military line.

The Invasion.—Scarcely did Campos get his boundary line into effective shape before Gomez with his retinue of Camaguey recruits crossed it into the jurisdiction of Sancti Spiritus, where he

In the meantime Gens. Roloff and Sanchez had successfully landed a large expedition of arms, men, and ammunition in the vicinity of Tunas, Sancti Spiritus, and these, joining Maceo and Gomez, constituted then the entire army disposed to invade that part of Cuba, garrisoned by overwhelming odds. According to Miro, Maceo's chief of staff, this entire force numbered scarcely 2,600 men, including servants without arms, soldiers, and officers, which in the eyes of the leaders at that time seems to have been a formidable force. The plan was then adopted to carry the war into the western province at once by dividing this army into small bands. These bands were then to march forward by separate routes, and at every opportunity they were to make a pretense of giving battle to the enemy. By presenting a small skirmish line, they hoped to hold in check any Spanish column which might attack them, while the pack train, with the bulk of the force, could make their retreat, and then by a retrograde movement advance farther into the provinces where there had been no successful insurrection. By continuing such movements as these the insurgents were to avoid any serious encounter with the enemy; but in certain localities farther west they were to concentrate, that the Spaniards, unprepared for them in that locality, might be surprised and routed. Scarcely had the plan been determined upon, when, on the

morning of Dec. 2, firing was heard upon the out-post of the camp. The insurgents were immediately prepared to move in accordance with these plans. The forces with their *impedimenta* were hurried through a narrow defile in the forest, while Maceo with 80 infantry and a few horsemen advanced to check the enemy. The Spaniards, supposing that they had now met the insurgent army, prepared to give battle by forming their companies in compact lines and directing their fire in volleys at the few dodging insurgents, whose plan they supposed was to lead them into ambush. This gave the main body of the insurgents ample time to make their retreat. After sustaining the fire of the Spaniards for an hour, losing but 1 man killed and 6 wounded, Maceo ordered his men to run, he being the last to leave the field. When the Spaniards, seeing their enemy flee, advanced with their *flanques* cautiously thrown out, they found that the rebel army had disappeared. The next day found the insurgents on their march to the west, sustaining various skirmishes with the Spanish columns, whose officers, in absolute ignorance of the enemy's tactics, reported battles with formidable numbers of insurgents.

At Igua, on Dec. 3, the insurgents sustained a combat with the troops under Segura, with a loss of 5 killed and 32 wounded. They then continued their march through the southern part of the province, sustaining various encounters with the troops. Entering the jurisdiction of Cienfuegos on the 15th, they met the Spaniards at Mal Tempo, and there ensued the most decisive action of the insurrection. The fight began in the morning at 8 o'clock, and the hastily formed squares of the Spanish raw recruits were repeatedly broken by the charges of the insurgents, who report having killed 210 of the enemy with the *machete*. The troops were undoubtedly put to flight, leaving in the hands of the rebels various trophies of their defeat. While the insurgents were dividing their booty they were warned of the approach of another column, which they immediately proceeded to attack under command of Maceo, and after half an hour's fight the Spaniards retired. About the same time Gomez, who was in another direction, stumbled upon another column, which he also fought with success; thus the insurgents had three victories in a single day. Continuing their advance the following day, they surprised and cut up a Spanish guerrilla near Santa Isabel de Lajas. Campos now endeavored to check their rapid movements by concentrating 8,000 soldiers to prevent their passing the valley of Cienfuegos; but by the usual skillful evasions of the rebel leaders a conflict was avoided until the opportune moment, when an inferior force could be surprised. By a series of forced marches they left Campos in their rear at Colon with 7,000 troops, and dashed across Matanzas province. By means of the railroads the Captain General moved his troops ahead again to check them, but by a series of zigzag movements Maceo was able to avoid the concentrated Spanish forces, while Gomez with 500 horsemen made a dash somewhere else. At Coliseo the insurgents under Maceo burned the town, and with a skirmish line of 200 horsemen held in check 2,500 Spanish infantry under Campos. They then made a retrograde movement to Las Villas, and again entered the jurisdiction of Cienfuegos after five days of continual marching. But without waiting for the Spaniards, who supposed the insurgents to be retreating, to determine upon any definite plans, they advanced again into Matanzas along the south coast, sustaining a serious encounter at Calimets with veteran troops, in which they lost 10 killed and 27 wounded—thus far their most serious en-

gagement. Maceo thence continued his rapid march along the southern borders of Matanzas and Havana provinces to the town of Guira de Melina, which he took, and thence northward toward Havana.

Throughout these movements of the insurgents their numbers were constantly being increased by negro field hands and Cuban youth, mostly from the neighboring towns, who, encouraged by the success of the movements, hesitated no longer to take the field. The banditti, who had always claimed to have been carrying on a war against Spain, in most cases hastened to join the insurgents, and their leaders were given a rank as well as all others who presented themselves with any number of recruits. Those banditti who did not proclaim for the rebellion and many free lances who deemed the opportunity had come to reap a harvest of plunder on their own account were shortly wiped out by the insurgent chiefs, who hanged them wherever captured. Gomez did not participate in so much of the fighting as did Maceo, but, attended by his escort, he planned continually to confuse the Spaniards with his circuitous movements, and with a policy at times conciliatory, and at other times despotic, he sought to claim the services of the peasants, who he well knew would not fight. He issued various decrees prohibiting the grinding of cane, the running of trains, and the supplying of the Spanish troops with provisions. By the hanging of an occasional unfortunate, he hoped to make these decrees effective, and by setting fire to the cane fields and destroying the railroads, he sought to create a reign of terror that would materially strengthen his cause.

On Jan. 7, 1896, he united with Maceo near Punta Brava, a dozen miles from Havana, and Miro reports that the concentrated force numbered 11,700 men. Here it was decided that Gomez should keep up his tactics of moving about with his escort, while the bulk of the force should return and distribute itself over Matanzas. Maceo, with 4,000 men, including his original Orientales, should continue into the westernmost province of Pinar del Rio. This plan was immediately put into execution. The Spanish military authorities were unprepared for any such movement, and while a column under the command of Gen. Garcia Navarro was sent in pursuit of Maceo, others were sent after Gomez. Maceo's advance into Pinar del Rio was eminently successful. So rapidly did he move that Garcia Navarro's column could not get up to him, while the surprised garrisons in front of him surrendered to his surging horde, which was continually being increased by the Cubans, who looked upon the multitude as already having won Cuba's freedom. Maceo's rapid movement continued along the north coast to the very last towns of Guane and Mantua, where his raids became more like a triumphal procession, the people rising *en masse* to welcome him. From Mantua he swept southward to the vicinity of the city of Pinar del Rio, and thence he continued his march along the southern highway back toward Havana. At Paso Real he was taken by surprise by the of column Gen. Luque, and thence ensued the famous but indecisive battle of Paso Real. While the Spaniards remained in possession of the city Maceo marched away, and with colors flying entered the city of San Cristobal, where he was received with demonstrations of joy even by those people who did not favor his cause. He then proceeded to attack Candelaria, which city had shown no disposition to receive him; but as he failed to force its surrender, and the pursuing columns came to its relief, he took to flight. Gen. Sabas Marin had hastily formed another *trocha* across the narrow part of the island between Mariel and Majana, to prevent Maceo's forces joining

close of Gomez, and had stationed 8,000 troops in the vicinity of Artemisa to intercept him. Maceo, with his usual skill, avoided an encounter with these, crossed the line, and was again in Havana without having fired a shot.

Failure of Campos.—The political policy of Campos had been one of conciliation, with a certain amount of reform, but it had failed. His military policy was to meet the insurgents on the field of battle, and with superior numbers and resources end the rebellion. Seconded by officers who had learned the science of warfare at home by planning battles on paper and with boy soldiers who scarcely knew how to carry a gun, his operations in the field had also failed. The beginning of 1896 saw the entire island, except the cities, in the possession of the rebels or else in a turmoil. Where there had been no rebels or tendencies on the part of the people to rebel, the country was rife with insurrection. The very people who had protested against the uprising now hailed the chiefs as harbingers of their independence. Gomez was marching back and forth, distributing his bands throughout Matanzas and Havana provinces, burning sugar estates on the pretense of their having violated some order of his or destroying railroad trains because they transported troops and hanging and shooting his followers as an example to the others. The whole country was claimed by him, and the Spaniards, with the exception of the columns sent in pursuit of Maceo, put themselves on the defensive by rapidly fortifying themselves in the towns and cities or on sugar estates. Burning cane fields illuminated the sky about Havana at night, and the smoke told of the destruction going on by day. Many Cubans, both white and colored, who had previously refused to sanction the conspiracies against the Spanish Crown now took the field, and many of the lower classes joined the rebels in some particular raid, only to return to their homes again and mingle with the Spanish soldiers as unconcernedly as though they were their faithful allies. The great mass of peasants who inhabited the rural districts would not fight, but the Spaniards soon discovered them in coalition with the insurgents, and, *pacifcos* that they were, they misled the Spaniards on every occasion. Soldiers and officers called for their punishment, but Campos refused to make war upon noncombatants. The Conservatives called this weakness, and cried out for more rigorous measures. The Spaniards in Havana, astonished at the rapid march of the insurgents and the inability of the army to check them, with the destruction going on at every hand, coalesced and demanded the recall of Spain's greatest general, and Campos went home, a failure.

Gen. Weyler.—This officer landed as Governor General of the island at Havana, Feb. 10, 1896. He was infamous to the Cubans for the atrocious deeds imputed to him when operating in Camaguey years before in the last war, but regarded by the Spanish conservative element as a general who would end the strife by most energetic methods. His arrival in Havana was consequently attended with demonstrations of joy on the part of the Spaniards, and he promised to have the immediate provinces shortly cleared of the rebels and the paralyzed industries once more assuming their usual activity. He then proceeded to reorganize the scattered and somewhat demoralized troops, and in doing so he made the grave mistake of trying to locate an insurgent army, using a big map of Cuba as the means of locating. Scarcely had he assumed his duties in the palace of Havana when Maceo effected his return into Havana province from Pinar del Rio, and, to show his disregard for

the new Captain General, swooped down upon the comparatively large city of Jaruco, looted and burned it, and then moved away again as rapidly as he had come. Gomez joined him, and the two chiefs discussed future plans, while their detached bands, without discipline or organization, continued to sack and burn villages, houses, and plantations, attack railroad trains, and destroy the stations, culverts, and bridges. By means of mounted messengers these bands were brought together to withstand some concentrated attack or loot a city, and then dispersed again to continue their depredations. Tribute was levied upon the planters who sought to remain friendly to the cause of independence, others were hanged when caught; servants were mached or shot, and pandemonium seemed to have been let loose. Weyler, like his

predecessor, failed to comprehend the movement and check its impetuous ferocity by making himself acquainted with the tactics employed, and, going a step or two farther, issued decrees preventing correspondents from learning the true state of affairs, and by his own ridiculous bulletins sought to make the public believe that he was winning victories. He massed his troops to attack

A SPANISH SENTRY.

an army when no such army existed, and when informed that the insurgents got away because they were mounted, instead of mounting his own soldiers, he ordered them to kill all the horses they could find, whether they belonged to the peaceable farmer or were abandoned by the insurgent. His rigorous measures consisted in giving his officers to understand that war was cruel, and they must kill—kill the enemy; armed or unarmed, it made no difference. Prisoners were a hindrance and expense, and when he was informed by his lieutenants that the *pacifcos* coalesced with the insurgents a significant nod was sufficient to sanction the slaughter which followed his assumption of duties as Captain General. Aware of the protest and clamorings of the people in the United States against this barbarous method of warfare, he sought to quiet them by publishing orders that no sentence of death should be executed without his signature, and persistently denied the massacres that followed. No doubt matters were going bad enough on either side, but Weyler, by his blind policy and mismanagement, his ignorance of facts and want of military skill and sound judgment, prevented the facts becoming known, and by his war upon the newspaper correspondents he created an enmity which had its natural result in the mass of pure fiction that found its way into the American newspapers and stirred the American people almost to the point of demanding intervention on the part of our Government. His attempt to muzzle the press clearly demonstrated either his ignorance or fear of the truth, and his false reports were only surpassed in ridiculousness by those sent via Key West by the American correspondent in Havana. He not only deceived himself as to the true situation

In the field, but prevented others learning it, while for every American correspondent expelled two others returned, prejudiced and prepared to work against him. On but one occasion does he seem to have shown any real understanding of the situation, and that was by the issue of a circular announcing that the war was not upon the negro, as had been supposed by the raw recruits and their officers fresh from Spain; and means were accordingly taken to incorporate the Cuban negroes who had not already joined the insurgents into the Spanish ranks. This movement met with success, for the Cuban negro, unlike the peasant, if properly encouraged will fight, and he cares little whether it be for or against the white Cuban or the white Spaniard.

The Occupation.—After the sacking of Jaruco, the Spanish infantry columns pursued the insurgents under Maceo and Gomez back and forth through Matanzas and Havana provinces for nearly a month without arriving at any decisive action other than the slaughter of horses and noncombatants, and a few insurgents. Gen. Weyler having declared the province of Pinar del Rio pacified, Maceo set out to re-enter that province and occupy it. With a host of followers, he entered the port of Batabanó on the night of March 13, sacking and burning it, and again before Weyler could get his columns of infantry up to him he was well on his way into the pacified province. The scene of war was now suddenly transferred from Las Villas, where Weyler was supposed to have been driving the insurgents, to the western province. Maceo, after one or two sharp fights, took up his headquarters in the mountains, and there bade defiance to the Spaniards. Weyler, instead of sending picked bodies of cavalry to pursue him and using his infantry to occupy the field permanently and cut off his enemy's escape, concentrated his efforts in the construction of a *trocha*. This line was run between Mariel and Majana, was 18 miles long, and consisted for the most part of the well-constructed cart road between Artemisa and Guanajay. Forts or blockhouses were built at intervals of 500 yards along this road and fences of barbed wire put up to prevent the passing of the insurgent cavalry. Two months were spent in the construction of this line, and it was reported that 30,000 troops were required for its defense. In the meantime Maceo, with his forces distributed in the hills, occupied himself with taking possession of the country. As Maceo's previous march through the province was one of triumph, it now became one of terror. Maceo himself appears to have been desirous of pursuing as humane a policy as circumstances would permit, but the wanton cruelties perpetrated by his lieutenants and their followers were as shocking as any of those imputed to the Spaniards; but, owing to Weyler's shortsighted policy in preventing correspondents mingling with the insurgents, these crimes in many instances were carefully covered up or else the seeker for information had only the word of the Spaniard to depend upon. The agricultural industries of this province were chiefly in the hands of small farmers, among whom figured a large proportion of Canary Islanders, a sober, hard-working people who, having no real grievance against Spain, did not favor the insurrection. But upon Maceo's first sudden and wild rush into the territory these people saw no other remedy than to proclaim for him and independence. Maceo ordered their property and tobacco fields respected, and frequently prohibited the rank and file of his followers entering the towns which had surrendered to him. On several occasions he meted out swift justice to those who violated the common laws of decency and good faith, and their placarded

bodies were left dangling to a tree as a proof that the rebels intended to preserve order. On leaving the province to confer with Gomez he left one Bermudez, an ex-bandit chief, in command. Bermudez at first kept to the hills, but upon the return of Maceo he at once inaugurated a reign of terror throughout the southern part of the province where he was detailed in command. Federico Nufiez, in charge of the district along the *trocha*, seconded Bermudez in his inhuman and atrocious deeds; on several occasions capturing Spanish soldiers and stringing them up in open defiance of the insurgent orders pertaining to the release of prisoners. Peaceable farmers were hanged without a shadow of reason, and it was a frequent occurrence to fire the peasant's ranch at night, on the pretense that the occupant was not wholly opposed to Spanish rule. Bands rode about the country intimidating the farmer gathering sweet potatoes for his family, and the least show of fear on his part was sufficient evidence to merit his being hanged to the nearest *guachimbo*. Tobacco sheds were burned, stone edifices pulled down, and the country desolated and depopulated. "To the trenches or to the mountains!" was the insurgent cry as they rode about the country, and then was to the *poor pacifico* who was caught seeking the protection of the Spanish trenches, while Weyler remained on the defensive building his *trocha*. It has been reported that the march of Bermudez was marked by the bodies hanged to the trees, and the climax was reached when he hanged twenty-odd to a single tree. Those who did make their escape to the Spanish fortified towns were not allowed to remain in safety, for at the least expected moment the insurgents would concentrate, and under the cover of darkness crawl up to the town, or into it, and then, with a wild whoop and flaming torch, set fire to the frail houses and sack and plunder. By May 1, 1896, only four intrenched and fortified cities were left in the hands of the Spaniards in the southern part of the province, and as these were overcrowded with refugees, their condition was pitiful. Appeals were made to Capt.-Gen. Weyler to do something to better their condition, but his only answer was that the sufferers must submit. Operating columns were sent back and forth through the province without making any intelligent attempt to reoccupy the country districts, and although they were massed on several occasions to attack Maceo in his fortified positions in the hills, owing to their lack of correct information and military ability they were discomfited on every occasion. During the summer months that followed operations were at a standstill, with Weyler holding the *trocha* and Maceo holding the province. The Captain General showed no inclination to take the field in person, and even Weyler's own constituents began to show signs of discontent. To the east of the *trocha* the rebels continued to hold forth in detached bands, raiding towns and burning cane fields and sugar factories. Operations were continued on the part of the Spaniards by marching small columns from town to town, firing upon *pacificos*, and having an occasional brush with the armed bands. During these months several insurgent leaders were killed, including Zayas, Mirabal, Sanchez, and José Maceo. Gomez with his escort retired to Santa Clara, and thence into his old territory of Camaguey, where, gathering about 500 followers, he met Gen. Jimenez Castellanos, who had sallied out of Puerto Príncipe with 2,000 troops. The Spanish general, unable to handle such a body of men, upon finding himself attacked, formed a square, where he was at the mercy of the insurgent fire until he ordered a retreat. His want of practical military knowledge cost him the lives of more than 200 soldiers, against

10 killed on the part of the insurgents. At last, when overwhelming odds were brought to bear upon the Captain General, he opened his autumn campaign by taking the field in person, and with 30,000 troops occupied the province of Pinar del Rio, seeking to starve and drive the rebels out.

Death of Maceo.—During Maceo's occupation of Pinar del Rio he had practically been abandoned by Gomez and the other insurgent chiefs east of the trocha. For months the Cuban *laborantes* had been looking forward to some movement on the part of the general in chief to concentrate his forces, break away through Weyler's trocha, and join Maceo or allow Maceo to join him; but nothing of the kind took place. Gomez continued in Camaguey, which was practically undisturbed by any operation on the part of the Spaniards after the loss sustained by General Castellanos at Saratoga; Laet's force had been nearly demolished in Matanzas, and Aguirre's brigade, near Havana, had dwindled down to insignificance. Several small bands were scattered through the western and southern part of Havana, and had fought under the command of Collazo, but separated upon his death. Gen. Bruno Zayas was sent to take command of these detached bands, but he was killed before he could get them together. Maceo, upon finding himself pressed by Weyler in the mountains of Pinar del Rio dispersed his followers through the rugged territory, and with a few of his escort proceeded to the north coast, and there crossed in a small boat the Bay of Mariel and landed safely to the east of Weyler's costly if not formidable trocha. He immediately sent out couriers to the chiefs of all the forces in Havana and Matanzas provinces, ordering them to concentrate at a favorite camping place near Punta Brava. While he was waiting for this concentration, on the afternoon of Dec. 7, some of the bands having already come in, firing was heard upon the outpost. Maceo, as usual, was the first to mount and ride forward with his escort, but this time he counted without his fighting negroes from the east. The insurgents who had already arrived in response to Maceo's summons proceeded to the attack, but the soldiers who had intrenched themselves behind a stone wall, directed their fire at the chief who rode out upon the slope of a hill to watch the engagement. As he saw his men making an attempt to surround the Spaniards, who were behind the stone wall, he said, "It goes well," and then fell, mortally wounded. Upon seeing their chief fall, those at his side fled precipitately, many of them being wounded, and the Spaniards occupied the field. As usual, they proceeded to strip the dead, while the officer in command, satisfied with the victory, returned to headquarters, little dreaming that Maceo, whom they supposed Weyler to be pursuing in the extreme west, had been their victim. The spoils of the dead chief fell to a native guide, who recognized upon the naked body the wounds of many a battle. While the soldiers were still in the act of plundering the dead, Pedro Diaz, learning that Maceo had fallen, came up with a force, and a desperate fight ensued, which resulted in the insurgents getting possession of their chief's body. The Cuban guide escaped with his booty, and, suspecting it to be the belongings of some important chief, he turned it over to the inspection of Major Cirujeda, commander of the Spanish force. It then dawned upon the Spaniards that they had killed Maceo, but as they could not conceive of the possibility of Maceo's crossing the trocha they refused to believe it. Then came the surrender of Dr. Zatucha, Maceo's staff surgeon, who, believing that with the death of his chief the cause of Cuba's freedom had ended, told how Maceo and a few of his

followers had crossed the Mariel Bay at night in a small boat.

The Revolutionary Government.—The scheme of the revolutionary leaders was to organize a civil government in Cuba at once, without waiting for the revolution to develop sufficient force to overthrow the existing government. After the meeting of Gen. Gomez with the leaders in Camaguey the scheme was carried out with the venerable Salvador Cisneros as President, other leaders forming his Cabinet. No attempt was made to establish this Government in a permanent locality, but the President with his Cabinet, surrounded by an armed escort, accompanied Gomez into the province of Las Villas, where later they were joined by Maceo with his invading army from the east at La Reforma. After the concentration at La Reforma and the determination to carry the war to the west the Government followed, with the invading army as a part of its *impedimenta*, avoiding conflicts with the Spanish troops until arriving at a point of concentration in the vicinity of Sancti-Spiritus. Here the army was reviewed, and a flag embroidered by the beautiful daughters of "Tinima" was presented to Antonio Maceo by the President, and the army proceeded on its western march, leaving the President and his Cabinet with their escort to return to Camaguey. While no attention was paid to this peculiarly formed Government by the Spanish military authorities, its existence was taken up as a basis for the recognition of the belligerency of the Cubans by the United States, and the Cuban *laborantes* and newspaper correspondents in Havana at once located a capital for it on the Cubitas range 25 miles from Puerto Principe, to which capital they gave the name of Cubitas. All manner of stories were circulated and published about this visionary capital which was generally described as an impregnable position which could not be reached by Spanish artillery. It was said to constitute the chief storehouse and manufacturing establishment of the revolutionists, where were compounded dynamite, giant powder, etc. Notwithstanding the fact that the Spanish columns marched through the range of mountains on several occasions without being able to discover any such stronghold or capital the story was persisted in and accepted as truth in the United States. Reports were also published that a mail service was established by this Cuban Government, and it was claimed that it was the only postal system in operation over two thirds of the island, and for its use an issue of Cuban postage stamps was printed in the United States. The writer, who has spent considerable time in the field with the Cubans, never has been able to discover any of these stamps in actual use in any part of the island. The Government organization did, however, map the island off into zones and formulate a plan to appoint a civil governor with jurisdiction in each zone. The zones were to be subdivided into districts or *prefecturas*, with a magistrate presiding in each district, to be known as the *prefecto*, with the rank and pay of a captain in the army. It was the specific duty of the Governor to appoint the *prefectos* in his particular zone and see that they complied with their duties as specified in the decrees issued by the President and his Cabinet. These duties finally consisted in the *prefecto's* taking possession of everything in his particular district, in the name of "Free Cuba," and appropriating it to the use of the officers and their followers as needed, who should give a receipt upon its delivery. Maceo seems to have carried the scheme into the extreme west of the island. Gomez used the *prefectura* system as it suited his convenience, appointing and disposing the *prefectos*, and even executing them,

according to his personal whims or passions, until called to a halt by the council formed by the President and his staff, upon his return to Camaguey, in June, after he had made the invasion.

The Cuban peasants who did not want war, but who had always looked upon the Spanish military rule in the island as unjust and oppressive, seeing the advantages obtained over the Spanish troops by the insurgents, at once showed a willingness to recognize the Government of his countrymen and obey the decrees and accept the commissions imposed upon them. By these decrees they were prohibited selling any produce for Spanish coin, and as there was no other money they could not sell at all. The prefects were required to make a list of all the male inhabitants living in their particular district and obtain from each an acknowledgment of the supremacy of the civil Government, upon which they were to issue a certificate of citizenship, after which any one found roaming about the country without such certificate and written authority from their prefects was to be considered an enemy of the republic. Upon these slight grounds Gomez executed many Cubans while moving about the central provinces with no apparent object except to keep out of the way of the Spanish troops. This he termed the organization of the country; and the levying of tribute by the various detached bands upon the sugar planters, cattle drovers, and fruit vendors was termed the collection of taxes; and after these taxes were gathered the payee was very frequently strung up to a tree for having violated the Government decree prohibiting the selling of his products for Spanish gold or taking produce from the country into the city in violation of other decrees.

In some parts of the island where the Spanish columns were unable to operate, owing to their attention being taken up by the activity of the insurgents in other parts, the *prefectura* system was established with an admirable degree of perfection. Some peasant of superior intelligence was selected as captain-prefecto, and his neighbor peasants were set to work planting crops to supply the insurgents and themselves with food. Again workshops were established within the depths of a forest or among the mountains for the manufacture of shoes, saddles, and other articles. In the execution of their various schemes the Provisional Government does not seem to have considered the necessity of any established force, either to protect the citizens who willingly recognized their authority or to see that their decrees were systematically complied with, but it was left to the good will of the citizens themselves to obey and execute, or to some roving band of armed rebels, frequently at the command of an arbitrary chief, to execute the erring citizen, or, on the other hand, with no adequate force to protect that which the Government had instituted, the citizen was often obliged to submit quietly to the destruction of his cattle and potato fields by the prowling rebels, who despised him because he did not fight. In those parts of the island where the troops were carrying on active operations the unprotected citizen was driven out, butchered, or taken prisoner, and his home and potato field were destroyed that he and his might no longer prove a benefit to the rebels.

Filibustering.—A large amount of war material was purchased by Marti, and vessels were chartered to transport it to Cuba, where arrangements were made for its reception, before the beginning of hostilities, but at Fernandina, Fla., it was seized by the United States authorities. Prior to May 1, 1895, three vessels, the "Amadis," the "Lagonda," and the "Baracoa," are reported as having taken arms and ammunition to Cuba.

Subsequently the tug "George W. Childs," the "Antoinette," the "Lark," the "Albatross," and the "Mallory" were all engaged in the service of the insurgents. Besides these, there have been recorded 36 expeditions fitted out in the United States, in spite of the vigilance of the Government at Washington. Of these, 17 are reported as total failures and 5 as partial failures, leaving only 14 as having successfully landed their supplies on the Cuban coast. Of the unsuccessful expeditions may be mentioned one that attempted to sail from Wilmington, Del. The men and arms were taken out into Delaware river in the middle of the night by a tug belonging to the Wilmington Tug Company, with orders to wait for an outward-bound steamer, which would blow three whistles, aboard which the men and arms were to be put. The expedition was engineered by Col. Emilio Nufiez and Gonzalo de Quesada, and the men being arrested, there were found in their possession letters addressed to Gen. Maximo Gomez, to the Marquis of Santa Lucia, and to the "Chief of Communications at Camaguey"; also presents of stylographic pens for Gen. Gomez and other leaders from Gonzalo de Quesada. It appears that the "Laurada" was outward bound that night, but owing to some accident to her machinery did not start. The arms were returned and ultimately went to Cuba. In the autumn of 1895 the steamer "Commodore" became an object of suspicion at New London, Conn., and when she went to Wilmington, N. C., a cargo called by express to her from the north. It was expressed from Providence, R. I., and from New York to Wilmington, the express charges amounting to \$942. The "Commodore" had been cleared for Cartagena, via Southport, N. C., and the captain, being apprehended, stated that he did not know what the articles were which were to be shipped, but he intended to clear the cargo as mining implements and machinery. About the same time a considerable body of strange men arrived in Wilmington, but the men disappeared upon learning that the ship was proceeded against. The cases marked "hardware" and "agricultural implements" were found to be arms and ammunition, including a rapid-firing gun of the most improved pattern. There was no direct evidence that the vessel was fitted out to commit hostilities against Cuba, and it was released. On July 9, 1895, the steamer "James E. Woodall" left Baltimore and subsequently landed a large expedition, under Roloff, Sanchez, and Rodriguez, in the vicinity of Tunas, Sancti Spiritus. Proceedings were instituted in Baltimore against Roloff, one Smith, and Dr. J. J. Luis for the fitting out of this expedition, and Dr. Luis was convicted March 27, 1897. Roloff forfeited his bail, and Smith never was apprehended. Two successful expeditions and six unsuccessful ones are reported as following this. Then came the steamer "Horsa," which left Philadelphia, Nov. 9, landing its boats with men and arms on the coast of Cuba six days later. Some of the arms and ammunition were lost by being thrown overboard, and on the return of the steamer to Philadelphia, the captain, J. H. Wiborg, and his two mates were convicted of violating the neutrality laws of the United States. The case was carried to the Supreme Court, which affirmed the conviction of Wiborg, but reversed that of the two mates. On Dec. 6 an expedition encamped at Cape Sable, Florida, under Enrique Collazo, disbanded on the appearance of a United States revenue cutter. In January, 1896, an attempt to take 300 men and a large quantity of military supplies was made by Gen. Canals, but with the "Hawkins," which foundered Jan. 27 off Long Island. All but five of the men were rescued by various vessels and brought back to New York. On

Feb. 15 the tug "Three Friends," assisted by the schooners "Ardell" and "Mallory," undertook to make its first filibustering trip, but on complaint of Spanish consuls the members of the expedition were detained. No case being found against them, they were liberated, after which, under command of Enrique Collazo, they again sailed for Cuba, where they landed on the beach at Veredero during the night of March 23, with their boats loaded. Being frightened at the proximity of a Spanish fort, the boats were abandoned, the men taking to the woods. The tug, unable to learn their fate, returned to Key West with the rest of the arms and ammunition, where she was detained by the authorities, but for lack of evidence was released. On March 15 the steamship "Bermuda" made her second trip, taking an expedition with Calixto Garcia in command from New York. The men

patrol boat, came in view from behind an adjacent key and opened fire. The bulk of the arms and ammunition was abandoned by Munzon, who fled with his men into the interior. The sailing master, William Gildea, and the captain of the expedition, Alfred Laborde, a correspondent, Ona Melton, and Dr. Vedia, and one Maza, members of the expedition, were captured and taken to Havana. William Leavitt and Charles Barnet, sailors, who were ashore when the firing began, were captured on their way to overtake the fleeing Cubans. There was a hasty court-martial at Havana, in which the Cuban Maza turned Crown evidence, and the prisoners were sentenced to death; but, owing to the interference of the United States consul, the proceedings were set aside, and after an imprisonment of eighteen months the men were released. The steamer "Laurada" made its third expedition, sailing

from New York, May 9, with men and arms, which were landed in Cuba, May 16. A fine was imposed on this vessel at Kingston, Jamaica. Capt. Dickman and Nuñez were tried in New York, and the jury disagreed. The captain was fined \$100 at Charleston, S. C., for violation of customs laws. The "Three Friends" made her second expedition from Jacksonville, Fla., on May 23, with an expedition which was safely landed in Cuba. On June 24 the same steamer undertook a third expedition with the assistance of the steamer "City of Richmond." The vessels were seized by the United States authorities, and the men were arrested before the expedition got away, but the vessels being released and the men discharged from custody, they got away and the expedition was landed between July 1 and July 13. On June 17 the tug "Commodore" made her third successful trip from Charleston, S. C., landing arms and ammunition on June 24. On July 17 the "Three Friends" made her fourth successful trip, landing both men and

SPANISH SOLDIERS BREAKFASTING. FORT NEAR MATANZAS.

were landed in Cuba on March 24 with a part of the arms and ammunition. The part of the ammunition which could not be landed was carried to Puerto Cortes, Honduras, where it was seized. Upon their return to New York Capts. O'Brien, Hart, and Nuñez were prosecuted, but were acquitted by the jury. A second trip of the tug "Commodore" with an expedition was attempted from Charleston, S. C., March 12. This expedition, under the command of Braulio Pena, was successfully landed in Cuba. The steamer on its return was libeled for making a foreign voyage, but the proceedings were never brought to trial. On April 20 the steamer "Bermuda" made her third trip, attempting to land in Cuba, but, failing, proceeded to Honduras. The members of the expedition returned in another steamer to Mobile, Ala. When the steamer returned to Philadelphia her British register was revoked. It is said that the arms and ammunition were thrown overboard on this trip by her captain, John G. Riley, who was fined \$315 in Honduras for landing certain of the men there. The schooner "Competitor," with arms and ammunition, left Key West on April 23, under command of Munzon, and arrived off the north coast of Cuba near Esperanza. The arms and ammunition had been put ashore when the "Mensajera," a Spanish

arms. On Aug. 5 the steamer "Laurada" left Philadelphia with the tug "Dauntless," the "Madeira," the "Oriole," and the launch "Richard K. Fox." They went to Navassa island, and thence took a large amount of war supplies to Cuba. On Capt. Murphy's return to the United States he was arrested, but was released on bail. Subsequently John D. Hart, owner of the "Laurada," was convicted in Philadelphia for violation of the neutrality laws, Feb. 23, 1897, but appealed, and was liberated on bail, Aug. 15. The tug "Three Friends" was seized by the United States steamer "Boutwell," and as nothing was found aboard but coal and medical supplies she was released. On Sept. 2 the "Three Friends" again left Jacksonville in disobedience to the Federal authorities. Her cargo of arms and ammunition was safely landed in Cuba, and on her return she was libeled in the district court at Jacksonville. On Oct. 5 the tug "Dauntless" landed successfully at the mouth of the San Juan river a large expedition of arms and ammunition, but owing to cowardice and mismanagement of the commanding officer in charge of the Cubans on shore after the expedition was landed nearly everything, including correspondence from the junta was carried away by the crew of a small Spanish patrol boat. On Oct. 6

the tug "Commodore" attempted to make her fourth trip with war supplies, but was detained by the Federal authorities. On Oct. 30 the "Dauntless" undertook to make her third trip, but was also prevented by the United States authorities. On Nov. 8 the "Three Friends" was again prevented from taking an expedition from Florida, but on Dec. 14 succeeded, on the pretense of proceeding on a wrecking trip, in taking on board at Fernandina about 40 men, with arms and ammunition. Proceeding around the west end of Cuba, she attempted to land these arms at the mouth of the San Juan river, but was fired upon by two Spanish patrol boats. The fire was returned, and without damage the filibuster made her escape. The expedition returned to Florida and was landed on No Name Key. A few days later the "Dauntless" slipped out of Jacksonville, picked up the expedition at No Name Key, and conveyed it to Cuba, landing it on the coast of Corrientas Bay. On Feb. 27, 1897, the steamer "Laurada" again made a successful trip with Carlos Roloff in command. This expedition consisted of 40 men with an important cargo of munitions and dynamite. She landed in Baines, taking care before landing to place three lines of torpedoes in the entrance to the harbor, in case there should be a surprise. For some time this point seemed to be left in the possession of the rebels, but when the authorities in Cuba were notified by the Spanish legation in the United States successful operations were carried through against Baines by the Spaniards. On her return the "Laurada" was libeled in Wilmington. On March 8 another expedition was planned by the steamer "Monarch" in Pensacola, but she was detained twice by the cruiser "Marblehead," and the expedition was disbanded. After the failure of this expedition the "Monarch" went to sea and, receiving coal in the Gulf, took on board an expedition near Punta Gorda, Fla., which she succeeded in debarking in Pinar del Rio. The greater part of the cargo was captured by the Spaniards a month later. On March 30 the steamer "Monarch" made her third trip to Cuba. On her return the vessel was to take an expedition which was being prepared at Miami, and, having received information that she would coal at Bahia Honda, the authorities were advised to send a revenue cutter, which seized her there and brought her to Key West with five men, who said they were passengers. The steamer "Bermuda," having secured a new register in Halifax, attempted to assist in the expedition that carried Roloff to Cuba, Feb. 27. After being detained in St. George, island of Bermuda, she went to Fernandina, but was not permitted to sail thence until her captain had made oath that he would not take part in any filibustering expedition—an oath which he had taken before leaving Philadelphia. On April 3, upon complaint of the consul in Jacksonville, the cruiser "Vesuvius" seized the tug "Alexander Jones," which was loading the "Bermuda" with coal and provisions. The latter was not seized because she was beyond the three-mile limit. The steamer which was to take the arms to the "Bermuda" was warned while lying at Fernandina, as were also Sanguily, Lechuga, and 50 expeditionaries, and in consequence none of them joined the "Bermuda." The expeditionaries of the preceding expedition left Jacksonville on a special train for Palm Beach, but the authorities were advised that they were waiting at the station and the train did not proceed. Afterward Emilio Nufiez landed from the "Bermuda," and was detained by the health officers; the "Bermuda" cruised around several days, loaded with coal and provisions, and sailed to Samana, where she was searched by the Dominican

authorities, who had been notified by the legation through the resident Spanish consul. At the same time the cruiser "Isabella II" arrived from Porto Rico, under orders of the Governor General of Cuba, to whom these facts had been communicated. The "Bermuda" then sailed to Port Antonio, Jamaica, where she was detained by the authorities, it being expected that her British register would be again revoked. On May 20 the tug "Alexander Jones" towed the schooner "John D. Long," loaded with war supplies, and met the "Dauntless" at Rock key. The "Dauntless" took the arms and made two trips to Cuba, landing her cargo successfully. On May 30 the "Dauntless" undertook her sixth filibustering trip, but, being pursued by the "Marblehead," threw overboard her cargo and was captured. The last reported filibustering expedition was that of the "Silver Heels," a schooner from New York, on Oct. 17, in combination with the "Dauntless."

The Cuban Junta in New York, led to the belief that Maximo Gomez was the man to master the situation in Cuba, made strenuous efforts during the summer of 1896 to fit out expeditions that the necessary war material might be landed for what they supposed would be the fall campaign. This is shown by the documents captured by the Spaniards, from the expedition landed on the San Juan river, which was in charge of one Betancourt, who refused after the expedition was landed to allow the American gunner Fredericks to fire and sink the Spanish patrol boat, which came into the river, landed its crew of 12, and carried off the supplies that had been landed thirty-six hours previously. By these documents it is shown that the junta held a meeting "on the 16th of July, 1896, in the city of New York," for the purpose of devising means "of collecting in a short time the resources of money necessary to send to Cuba in the next months arms and munitions of war in the greatest possible quantity." In ignorance of the situation in the island, the committee looked toward the sugar industry of Cuba as a means of raising these funds, and decided to publish a decree in the city of New York "prohibiting work on the coming crop in Cuba." Then it was proposed to permit secretly "the least possible number of plantations to grind," imposing upon them a tax of ".50 cents for each bag of sugar worked out, paid in advance immediately in American money." It was also provided that planters who had previously made sugar in violation of the decree should be forced to pay at the rate of 50 cents a bag for their previous crop before they would be allowed the privilege of making another crop; and to all planters who respected these decrees the delegation would guarantee, in the name of the republic, "the respect of the Cuban forces for their property and the protection of the work of making the crop and the preparation to grind." In a letter dated New York, July 23, 1896, addressed to Gen. Maximo Gomez, by T. Estrada Palma, it was declared that "every kind of diligence is used to supply you with arms and ammunition. From the 31st of June to the 6th of July 400,000 cartridges and 600 rifles have been landed, among them 400 Mausers, nearly 2,000 pounds of dynamite, wires, electric batteries, *machetes*, medicines, etc. But our earnest desires and diligence are dashed to pieces against the scarcity of funds which threatens. In virtue of this state of affairs we must solve the problem in this way: The campaign of the approaching dry season may be decisive in our favor if our army should find itself well provided with arms and ammunition. In this case the enemy's army, so far from gaining the least advantage, would suffer considerable losses, and then when the end of the campaign arrives with no fa-

vorable results for the Spanish arms the Spaniards resident in Cuba and the Government of Madrid will have lost all hope of suffocating the revolution, the latter will have exhausted every resource to which it has turned, and will lack means to continue the war. It is therefore indispensable from every point of view to obtain money sufficient to land in Cuba before November 5,000 rifles and some millions of cartridges. My efforts to place our bonds and to contract loans in the United States, London, and Paris have been fruitless. After many promises unfulfilled and hopes vanished, we have arrived at the conviction that we shall obtain nothing in this way; and as patriotic gifts are extremely deficient, there remains no way other than that of taxing the approaching sugar harvest. By the accompanying documents you will perceive that I have formed a committee with this object. Miguel Betancourt will tell you who form it. If you and the Government sanction the idea we shall have within a month at least \$200,000, assuring thus the continuance of the campaign and of the economic disturbance in the island; no grinding, therefore, should be allowed except in those few sugar works that will advance a portion (50 cents a bag) of the tax upon the crop, which amount should be paid directly to the Government, to you, or to the delegation abroad. I beg you, general, to take into consideration the difficulties that surround me with regard to the solution of the problem of pecuniary resources with any other than the one I propose, and which I am already carrying out in the hope that it will be approved. . . . No one will charter us a vessel unless we deposit its value, \$40,000 or \$50,000, which for the moment we can not dispose of in this way. I am working, however, to secure the 'Three Friends,' even if I have to guarantee \$25,000, and I believe I shall manage to use her again."

In a letter of the same date, addressed to the President of the republic, Mr. Palma complains that 42,000 tons of sugar was made in Cienfuegos and 6,000 tons in Trinidad which, to his knowledge, paid no tax to the revolution, as also happened in the plantations of Matanzas. He declares the necessity of forcing these plantations to pay the required 50 cents a sack to the junta, thus hoping to raise the "\$200,000 and more which we must have."

Operations of 1897.—If the efforts of the Cuban junta had been seconded by the revolutionists in Cuba with an equal decree of earnestness there might have been a "fall campaign" on the part of Gen. Gomez. With the completeness of the destruction of Pinar del Rio and the absence of any more prospects of booty, Maceo's negro followers had dwindled away. He still had a few followers left, but not enough to make a determined stand against the concentrated efforts of Gen. Weyler, who began the autumn campaign of 1896 by moving against him with 30,000 troops. Leaving his few faithful ones under the command of Rius Rivera, Maceo crossed the trocha and met his death near Havana, as we have seen. After this event Weyler left a few troops in Pinar del Rio to pursue the remaining bands, and at once declared the province "pacified." Subsequently Rius Rivera was wounded and captured by Gen. Hernandez Velasco and sent to Havana a prisoner. Although the Artemisa or Mariel-Majana trocha had proved a failure, Weyler ordered the reconstruction of the line between Jucaro and Moron. Gomez, who had been wandering around Camaguey with the Government ever since his fight with Castellanos in June, crossed this line about the middle of December with President Cisneros and his Cabinet, returning to the vicinity of Sancti Spiritus. Pitching his camp in his favorite field, La Reforma,

he sent out messengers to bring together the scattered insurgent bands in the province. Now there was no excuse for a scarcity of war material, and it was supposed by the Cuban *laborantes* that the old chief would at once carry out the proposed campaign by again invading the western provinces to defy the Spaniards at the very gates of Havana. By the middle of January the forces had concentrated in obedience to Gomez's command, leaving unprotected certain strategic positions which might well have been held against overwhelming odds, where the peaceful noncombatants had set up *prefecturas* and workshops, and had productive fields for the maintenance of themselves and the army. With his concentrated bands Gomez proceeded to lay siege to the insignificant town of Arroyo Blanco, near Sancti Spiritus. He notified the commander of the little garrison of his intention, requesting that as an act of humanity he send all noncombatants out of the place to escape the deadly effect of his dynamite gun, which was being prepared to hurl the explosive into the town. Capt. Escobar, the Spanish commander, refused to grant the request, and the siege was begun. The dynamite gun proved a failure; and when re-enforcements arrived Gomez was obliged to withdraw, with a loss of 4 killed and 22 wounded. The Spaniards then attacked Gomez without any definite plan, and a series of fights ensued.

In the meantime Gen. Weyler declared the province of Pinar del Rio pacified, and he was proceeding with his pacification of the other provinces. Setting out with a large force from Havana, he marched along the highway to San José las Lajas, and thence to Villa Clara. As he met with no opposition, his operations were confined to the enforcement of his decree of concentration, by which all noncombatants inhabiting the country were to be brought within the intrenched and fortified towns. His column scurried over the country, burning and destroying everything that might give shelter to the insurgents. Weyler arrived in the city of Santa Clara early in February, and there discovering that there were no formidable bodies of insurgents to oppose his progress, he distributed his troops in operating columns over the entire province, with orders to burn and destroy. To see how well this work was done, he took up a line of march back and forth across the province, attended by his escort of 400 Cuban negroes and a small body of infantry. Nowhere was he met by any determined opposition. Before the end of the month his columns were poured into the fertile valleys of the mountains between Santa Clara and Trinidad, where the most perfect organization of the Provisional Cuban Government's *prefectura* system had been carried out. Herds of cattle were driven away by the troops, hospitals destroyed, coffee plantations demolished, and potato fields dug up. The noncombatants, employees of the civil authorities, were forced to take to the woods, and when captured were either killed or carried away with the women and children to the fortified towns, where the greatest misery prevailed. Gomez, after sustaining one or two unimportant engagements with the columns operating in his vicinity, ordered his bands in detachments to proceed west and harass the Spaniards at every opportunity. With his escort and about 60 armed men he remained in the vicinity of La Reforma. On March 9 he was attacked by the Spaniards, and the American correspondent, Mr. C. E. Crosby, who arrived the day previous, was killed while watching the engagement.

During the latter part of the same month Gen. Quintin Bandera came from the east with about 250 negro followers, and, going around the trocha

by wading in the shallow water out at sea, joined Gomez at La Reforma. Ordered by the general in chief to proceed to the west, he went as far as the Trinidad mountains, but, failing to meet with support, he returned to the east of Sancti Spiritus, where he was reported killed at Pelayo on July 4. Gomez continued to camp in the vicinity, persisting in his usual bushwhacking tactics by sending a few men to check the enemy when attacked, while with the bulk of his force and *impedimenta* he would make his retreat through some narrow defile. To the east of the trocha the insurgents under Calixto Garcia took the town of Las Tunas after two days and two nights of fighting. The Spanish guerrilla force of 48 men was cut down after the capture of the town, the insurgents refusing to give quarter.

The insurgent bands in the provinces of Havana and Matanzas, constantly pursued by the Spanish troops, were badly broken up in the early part of the year. Gen. Laet, who had commanded the Matanzas division of rebels, and who had done some hard campaigning, keeping several columns almost constantly upon his trail, was relieved of his command by Gomez. He was charged with being too lenient with the *pacíficos*, refusing to execute all who were caught violating some Government decree. Gen. Alexander Rodriguez was sent to take command in the province, but he seems to have remained inactive, and the former force of Laet, either failing to recognize him as their leader or without a competent one, were generally dispersed.

Mayia Rodriguez was ordered from the east to invade Matanzas and Havana provinces, but, unable to muster any considerable force, he was confined to the Signanea mountains in Las Villas by the Spanish troops.

Gen. José Maria Aguirre, commander of the Havana brigade, died of pneumonia, at Ceiba Mocha, in December, 1896, and his force separated into a number of small bands, the most important of which proved to be that commanded by Nestor Aranguren. On the night of Jan. 16 he derailed a train between Havana and the suburban village of Guanabacoa, taking prisoners ten unarmed Spanish officers and three Cubans. After conducting them to his camp in the vicinity of Jaruco, he set them all at liberty with the exception of two of the Cubans, whom he hanged as traitors. His action in releasing the Spanish prisoners created a great deal of favorable comment for the insurgents. As the year drew to a close, however, he executed the Spanish peace envoy, Lieut.-Col. Ruiz, who went to him from Gen. Blanco with propositions of Cuban autonomy.

In September, Gen. Adolfo Castillo, who commanded the insurgents in the south of Havana province, was killed, and his body brought to Havana. The bulk of his force, consisting of about 400 men, mounted and unmounted, was left in command of Juan Delgado. These pursued the usual tactics of keeping an outlook for the Spanish troops and running away upon their approach.

In October Gen. Parrado with five companies of cavalry and several of infantry left Havana, scouring the country without finding any trace of insur-

gents until in the vicinity of Las Pajas, where he received word that a force under the command of the Cuervo brothers was in the vicinity. Negotiations were opened with them, which ended in their surrender with forty men.

In the latter part of November Gen. Parola with a large force started from Havana to carry on operations in the east. He marched across that territory occupied by Gomez without meeting with any serious resistance, and when he reached the Rio Cauto his operations were checked by a scarcity of supplies.

The Question of Starvation.—As the atrocious deeds of Gen. Weyler's most favored lieutenants caused great feeling in the United States, so did his policy of concentration. Upon his arrival in Havana he issued a decree that all the peaceable inhabitants in the eastern provinces should concentrate within the Spanish fortified towns, but this

A BARRICADED STREET IN GUANABACOA

order was not put into force, owing chiefly to the fact that the insurgents began to put into effect their policy of concentration in the invaded provinces. The insurgent chiefs drove all the noncombatants out of Pinar del Rio, except where the Spanish troops were able to defend them behind their trenches, and in the central provinces they made them citizens of the new republic or hanged them. During the summer of 1896 the suffering of the concentrated *pacíficos* had already begun in those towns occupied by the troops, but little attention was given to the subject. Appeals were made to Gen. Weyler for their relief, but he refused to aid them till their sufferings were such that the municipal authorities toward the end of the year managed to supply the needy with daily rations. These were cooked in caldrons in the open streets and served to all comers, who carried the food away in whatever receptacle they might have at hand. When Weyler decided to take the field himself to operate against the insurgents under Maceo in Pinar del Rio he published his decree of concentration of Oct. 21, 1896. But in Pinar del Rio all the people except his avowed enemies had already concentrated. In the other provinces it was a fact well-known by the Spaniards that no one was allowed to remain outside their lines by the rebels unless there to help the cause of insurrection. Consequently Weyler's determination to allow no one to live outside the Spanish lines, adjoining each city or town fields were marked

off, called zones of cultivation, and, as the name signified, the land was allotted to all *pacíficos* who chose to cultivate it. Eight days were given by Weyler in which everybody outside the lines must surrender or come in, at the end of which time those still remaining in the field would be treated as enemies to Spain. Weyler's plans were carried out with more or less faithfulness by his various officers. Gen. Muguiza, with his headquarters at Pinar del Rio, sallied out with his troops to destroy and kill, cutting a swath of devastation and fire through the fertile country. For the *pacíficos* he had no mercy, proclaiming them all rebels. On the other hand, Gen. Hernandez y Velasco pursued more moderate means of conquering his foes, absolutely refusing to kill his prisoners, and endeavoring to induce them to see the hopelessness of their struggle against Spain. Other officers operating under Weyler in Las Villas pursued a contradictory policy, some generals refusing to kill noncombatants, others killing all whom they could find except women and children.

The result was about the same, for hundreds of noncombatants were crowded into the towns and cities, and, being naturally an improvident people, and probably sick for their homes mid the green fields of the country, they refused to cultivate the zones allotted to them, and their situation was appalling in the extreme. Some died of pestilential diseases, others of starvation. Sensational reports were spread in the United States that many of them were American citizens, and on May 17 the President appealed to Congress to pass an immediate appropriation of \$50,000 for their relief. Congress voted the sum, and three months later Consul-General Lee at Havana reported that he had fed every distressed American that he could find, and had furnished transportation to those who wished it. Of the sum voted he had not expended \$10,000. Of the whole number of sufferers whom he had assisted 95 per cent. were naturalized Americans, most of them unable to speak English, and never having lived in the United States, they being the wives and children of men naturalized in this country.

At the beginning of the present year our Government issued an appeal to our citizens for contributions to aid the suffering people in Cuba, and Minister Dupuy de Lome announced that all supplies for the purpose would be admitted at Havana free of customs duties. The steamers plying between New York and Havana agreed to transport the supplies free of charge, and the authorities in Cuba announced that while they would accept such aid from the people of the United States as an inestimable benefit, they would not accept it as intervention in the internal affairs of Spain.

Reform Measures.—Although the insurgent leaders never claimed to be battling for reform, the position was taken at once that Cuba was very much in need of reform laws. Campos well understood that it was not the laws that needed reforming, but the administration, and it was this that he set out to do. Weyler was known to be an energetic officer of the mediæval type, and by his resolute, hard campaigning he had won rank after rank and badge after badge, although it is said that his work was always marked with blood, fire, and desolation. Señor Canovas del Castillo was a firm believer in the generalship of Weyler, and his policy was to put down the insurrection by the force of arms, and talk of reforms after the power of Spain had made itself manifest. Gen. Weyler was the officer to carry out this policy, but instead of carrying it out by skilled military manoeuvres and practical force of arms against the undisciplined bands that were surging over the island, his policy was one of destruction, starvation, and blood-

shed. If it had not been for the close proximity of the Cuban shores to the United States, it is probable that he would have been allowed to continue his work. But the very Spaniards in Cuba who had rejoiced upon Weyler's arrival at Havana, believing him to be the man of resolution needed to put down the uprising, finally protested at his ruthless measures. Canovas, nevertheless, was determined that Weyler should remain to the finish. But on Aug. 8 the Prime Minister was assassinated by an anarchist at Santa Agueda. Her Majesty then intrusted the presidency to Gen. Azcarraga, Minister of War, but it was understood that a more definite change would soon be made. Nothing appears to have been done in this respect until Sept. 29, when the resignation of the Spanish Cabinet was announced. Azcarraga was requested by the Queen to remain in office till the new ministry could be formed, headed by Sagasta, who took the oath of office Oct. 4. Señor Sagasta was the old Liberal leader in Spanish politics, and, though he was a firm friend of Canovas, his policy regarding Cuba was more on the lines of that pursued by Marshal Campos. His advent to power was well received throughout the peninsula, and Gen. Blanco was appointed to succeed Weyler. Blanco, before sailing, announced his policy to be the granting of reforms, fully as outlined by the Sagasta ministry. Upon his arrival at Havana he found the affairs of the island in the most deplorable state. Not only were the starving *pacíficos*, whom Weyler had huddled together in the towns and who had not already succumbed to their fate, crying out for relief, but the soldiers, who had not been paid for months, were scarcely in a better plight. Gen. Blanco immediately gave orders to abolish the concentration plan, declaring that it would never be his method of warfare, as he only intended to fight the enemy, and not the women and children. His Government authorized him to sign a credit of \$100,000 to be devoted to the relief of the suffering peasants, and the work of reconstruction was begun. All American citizens who were in prison, including the "Competitor" prisoners, were released, besides many others who had already been sentenced to death. A circular was issued asking all Cuban emigrants, whether they had exiled themselves for political motives or not, to return to the island. Measures of relief were actively pushed by Blanco, who ten days after his arrival, Nov. 11, signed a decree affording every facility for sugar-making and authorizing agricultural and industrial labor. The surcharge of 20 per cent. imposed by the railway companies was suppressed, as also the military measures concerning agricultural implements, which practically prohibited the Cuban peasant the use of his knife and *machete*.

Gen. Weyler left Havana immediately upon the arrival of Gen. Blanco and proceeded to Spain, where his presence created some agitation, but evidently he had failed to satisfy all his Spanish adherents, for several attempts to get up demonstrations in his favor met with poor results. Upon the publication of President McKinley's annual message to Congress, Gen. Weyler addressed a protest to the Queen Regent, which he allowed to be published in the paper adherent to his policy. For this act the papers were prosecuted and Weyler was summoned before the Supreme Court and afterward to the Captain General of Madrid.

The present year finds Gen. Blanco actively engaged in putting into effect the scheme of autonomy, with the home Government sincerely assisting him. Native Cubans have been appointed to the offices of civil magistrates, and a council has also been formed of prominent Cubans to assist in the government of the island. Another \$100,000 have

been appropriated by Spain for the relief of the *pacíficos*, and employment has been given to many by the rebuilding of the small towns that were destroyed by the insurgents in their raids during Weyley's régime.

Gen. Gomez from his various lurking-places to the east of Sancti Spiritus still bids defiance to the Spanish Government, with the statement that the Cubans will have independence or death, and all peace envoys are threatened with execution unless the peace they offer be based upon absolute independence. Aranguren, pursued by the troops under Gen. Parrado, has disappeared for the present from history, while Juan Delgado holds forth upon a ridge of country to the south of Havana, where he exists upon the vegetables planted within the zones

of cultivation and runs on the apparatus of the troops. In Pinar del Rio the Dances, brothers and the cruel Bermudez still hold fast in the hills, but without any formidable numbers of followers to offer material resistance to the troops. Baldomera Acosta, who formerly commanded a small force in the vicinity of Havana, which was most successful in alluding the vigilance of the troops always avoiding an encounter with them, has made his escape from the island, while Pedro Diaz, who bravely rescued the body of his chief, Antonio Maceo, Pepe Rose, a prominent leader in the early part of the invasion, and many others have failed to turn up and give an account of themselves, while many of their followers, finding themselves without competent leaders, have surrendered.

D

DANA, CHARLES ANDERSON, an American journalist, born in Hinsdale, N. H., Aug. 8, 1819; died near Glen Cove, Long Island, N. Y., Oct. 17, 1897. He was descended from Jacob Dana, the eldest son of Richard Dana, who came from England and settled in Cambridge, Mass., in 1640. His boyhood was spent in Buffalo, where he worked in a store, and prepared himself for college. He entered Harvard in 1839, but after two years his eyesight became impaired and he was compelled to leave. Several years later he received the bachelor's and master's degrees. In 1842 he became a member of the Brook Farm Association, in Roxbury, Mass., which was formed to realize an ideal of social, intellectual, and philosophical life. His associates in this agricultural and educational experiment included Nathaniel Hawthorne, Margaret Fuller, George William Curtis, George and Sophia Ripley, William Henry Channing, Theodore Parker, and John Sullivan Dwight. The Brook Farm enterprise forms the basis of Hawthorne's "Blithedale Romance," but Hawthorne declares in his preface that none of his characters are portraits. In an address at Ann Arbor, Mich., in January, 1897, Mr. Dana gave his recollections of the experiment. He said:

"Charles Fourier was one of the greatest of theorists on the subject of social institutions and social progress. Fourier's arguments were very striking. In the first place there was the economy of the new system. You could lodge, feed, and clothe a thousand people in one great combined household much more cheaply than when each family had its own separate dwelling. The organization of the 'Brook Farm Institute of Agriculture and Education' was conceived in transcendentalism, and designed to carry on social life in accordance with democratic and Christian ideas. There had been all the time a notable agitation respecting the unsanitary habits of college students and of people who pursued literature and learning. The argument was, that while any one was pursuing philosophy and literature and philology and mathematics he ought to work on the land and cultivate the earth. But there was no communism about this life. Individual liberty and independence were strictly guarded. The only thing that had the appearance of communism was the common opportunity of education and a living at the same time. Nobody could get better board than all had. In reorganizing society and bringing it down to the new basis the teaching of Fourier, which we adopted, was that all industries should be carried on in groups and series. One group included the cooks, the waiters, the dish washers. They were organized, and worked to-

gether. I know that, because I was the head waiter. And it was great fun, I can tell you. There were seventy people or more, and at dinner they all came in and we served them. It is true that the theory was not always fully realized, but we realized a great amount of instruction and a great amount of satisfaction, and when we finally separated after the burning of our building, in which so much of our hopes had been centered, we went away each to begin life in the world again. I went to Boston to earn \$5 a week on a morning newspaper. We all began anew very soon, except Mr. Ripley. He remained and settled up the affairs, and when the business was closed up and all the accounts paid, as they were, we owed nobody a dollar."

Mr. Dana's first newspaper experience was gained in the management of the "Harbinger," which was devoted to general literature and reform; then he gave two years of editorial work to Eliza Wright's Boston "Chronotype," after which he joined the staff of the "New York Tribune," in 1847. In 1848, the year of European revolutions, he proposed going to Europe as correspondent of the "Tribune." Mr. Greeley opposed this project, saying, "Dana, that's no use. You don't know anything about European matters. You would have to get your education before your correspondence was worth your expenses." But Mr. Dana was determined to go, and Mr. Greeley agreed to pay him \$10 for one letter a week. In relating this episode in after years Mr. Dana said: "I went over and wrote one letter a week for the 'Tribune' for \$10, one to 'McMichael's Philadelphia North American Review' for \$10, one to the 'Commercial Advertiser' for \$10, and one to the 'Harbinger' and 'Chronotype' for \$5 a week each. That gave me \$40 a week for five letters, until the 'Chronotype' went up, and then I had \$35. On this I lived in Europe eight months, went everywhere, saw plenty of revolutions, supported myself there and my family in New York, and came home only \$63 out for the whole trip."

On his return to New York he became a stockholder in the "Tribune," and its managing editor. He held this place till 1862, and under his management the paper acquired a large circulation and extraordinary influence. This was the period when the antislavery struggle came powerfully into national politics and culminated in the civil war, and the "Tribune" was the foremost champion in the field of journalism of the free-State cause as against the repeal of the Missouri compromise and the aggressions of the proslavery party. The Republican party, whose chief characteristic was opposition to the spread of slavery into the Territories, was formed

in 1854, and this journal was its best-known and most powerful organ, not in the metropolis only, but, in its weekly edition, throughout the country. Henry Wilson, in his "Rise and Fall of the Slave Power," says that "at the outset, Mr. Greeley was hopeless and seemed disinclined to enter the contest. He told his associates that he would not restrain them, but, as for himself, he had no heart for the strife. They were more hopeful." Mr. Dana was not only the most hopeful but the most vig-

bration at Memphis. I remember it particularly because it was there that I first met Gen. Grant. The officers stationed in the city gave a dinner that day, to which I was invited. At the table I was seated between Grant and Major John A. Rawlins, of his staff. I remember distinctly the pleasant impression Grant made—that of a man of simple manners, straightforward, cordial, and unpretending. He had already fought the successful battles of Fort Donelson and Shiloh, and when I met him

was a major general in command of the district of West Tennessee, Department of the Missouri, under Halleck, with headquarters at Memphis. Although one would not have suspected it from his manners, he was really under a cloud at the time because of the operations at Shiloh. Those who did not like him had accused him of having been taken by surprise there, and had declared that he would have been beaten if Buell had not come up. I often talked later with Grant's staff officers about Shiloh, and they always affirmed that he would have been successful if Buell had not come to his relief. I believe Grant himself thought so, although he never, in any one of the many talks I afterward had with him about the battle, said so directly."

Afterward he was sent to the Western army, ostensibly as a special commissioner to investigate the pay department, but in reality to ascertain the truth about Gen. Grant, against whom there was a powerful conspiracy among certain military men who were jealous of his success and wanted to break him down. Mr.

Dana appreciated Grant's abilities and his value to the service, and his report had an important influence in defeating the conspiracy. Gen. Sherman says in his "Memoirs": "One day early in April, 1863, I was up at Grant's headquarters, and we talked over all these things with absolute freedom. Charles A. Dana, Assistant Secretary of War, was there, and Wilson, Rawlins, Frank Blair, McPherson, etc. We all knew, what was notorious, that Gen. McClelland was intriguing against Gen. Grant, in hopes to regain command of the whole expedition, and that others were raising clamor against Grant in the newspapers of the North. Even Mr. Lincoln and Gen. Halleck seemed to be shaken; but at no instant did we (his personal friends) slacken in our loyalty to him."

Mr. Dana was in the saddle at the front a large part of the time during the Vicksburg and Chattanooga campaigns, and again in the overland Virginia campaign; and as he had appreciated the abilities of Gen. Grant from the first, so he retained confidence in them to the end.

In 1865 Mr. Dana went to Chicago to take charge of a new paper, "The Republican," which was established with abundant capital and was expected to make itself the most powerful journal in the West. But there was disagreement as to its policy, and a year later he returned to New York. There he organized a stock company to buy "The Sun," of which he became editor, with absolute control of its columns. His first number was issued in January, 1868, and he was active as its conductor nearly thirty years. He made it independent, with Demo-

orous, and the energy displayed by the "Tribune" was mainly furnished by him. In 1861 he went to Albany to advocate the election of Mr. Greeley to the United States Senate, but Thurlow Weed brought about a union of Greeley's opponents, which gave the office to Ira Harris.

At the beginning of the civil war Mr. Dana made the "Tribune" as vigorous in support of the Union as it had been in opposition to slavery extension, and when the pressure for an early and active campaign toward Richmond had resulted in the disaster of Bull Run a large part of the popular reproaches fell upon that journal. The next year, as it became evident that he and Mr. Greeley could not agree concerning the proper conduct of military operations and the attitude of the paper toward them, he resigned his editorship, and soon afterward he was made Assistant Secretary of War. This brought him into close personal relations with President Lincoln and Secretary Stanton, who placed the utmost dependence upon his judgment and powers of observation, and for the greater part of the time till the close of the war he was kept at the headquarters of the great armies, to give the War Department accurate information of the state of affairs at the front. In his "Reminiscences," published in 1897, Mr. Dana gives this account of his first meeting with Gen. Grant:

"All the leisure that I had at Cairo I spent in horseback riding up and down the river banks and in visiting the adjacent military posts. My longest and most interesting trip was on July 4, when I went down the Mississippi to attend a big cele-

cratic proclivities, and put into it a force and spirit that challenged attention from the first, and it was universally identified with his own personality. It was absolutely fearless, and was often accused of bitterness and malignity. His criticisms of misadministration under the presidency of Grant were met by an attempt to take him from New York, on a charge of libel, and try him in a police court in Washington. But Justice Blatchford, of the United States District Court in New York, refused to issue a warrant for his removal, holding that the proposed form of trial was unconstitutional.

Mr. Dana was no mere figurehead in journalism. He was at his desk in "The Sun" office several hours every day, hard at work, and he declared that it was a constant amusement to him. His editorial rooms were exceedingly plain. He was always on familiar terms with his staff, and no one with any legitimate errand found difficulty in getting access to him.
